

FIG. 2.—LAWSON'S MOTOR-BICYCLE.

Lawson's Motor Safety Co., of 40 Holborn Viaduct, London, E.C., in addition to exhibiting the new motor-bicycle (Fig. 2) in both racing and roadster form, which we described some time ago, is showing a two-seated motor-tricycle and a new light motor-delivery-tricycle. In the bicycle and the two-seated tricycle the petroleum-spirit motor is placed on one side of the back wheel, its fly-wheel balancing it on the other. The motor is stayed by being fixed to two brackets fastened to the back wheel. The crank shaft, of course, passes through the rear wheel, and the speed reduction is

FIG. 3.—LAWSON'S MOTOR-CARRIER-TRICYCLE.

attained by means of epicyclic gearing connected up to the inside hub by a clutch. The motor, in the case of the bicycle, is designed to develop  $1\frac{1}{2}$  h.p., the bore of the cylinder being 4 millimetres and the stroke  $2\frac{1}{4}$  in., while in the two-seated tricycle the motor is capable of working up to  $2\frac{1}{2}$  h.p. Ignition is by an incandescent tube heated by a burner supplied from an independent tank fitted with a pressure

pump. The brakes are powerful and so coupled to the carburettor that at the time of their application the supply of explosive gases is automatically cut off from the motor. The tank carried at the rear of the saddle is oval in shape and fulfils a four-fold purpose. It contains the supply of spirit, a special carburetting chamber, a lubricating oil chamber, and a pressure tank fitted with pump for the supply of spirit to the burner. Speed is regulated by the coupled brake and mixture control device, and also by varying the air supply. By the release of the clutch, controlled by a small screw-handle placed on the head of the machine, it is possible to cut off the power transmission from the bicycle. It then runs without the motor driving at all, when coasting, etc. The delivery tricycle (Fig. 3) is quite a new departure, for while being larger than an ordinary carrier tricycle, it is not so large as a light van, its carrying capacity being about 2 cwt. The motor and transmission is the same as in the two-seated tricycle, but it is all mounted on the front wheel, which is carried in a specially strong fork and "head." A comfortable seat is provided on the front of the carrier for the driver.

The De Le Croix Motor Syndicate, Ltd., of Throgmorton House, 15 Cophthall Avenue, London, E.C., have on view a

FIGS. 4 AND 5.—END VIEW AND SECTIONAL ELEVATION OF DE LE CROIX MOTOR.

new type of motor sociable quadracycle, weighing complete about 300 lbs. The frame is built up of steel tubing, the four wheels being of the suspension type fitted with pneumatic tires. The motor is a twin-cylinder one of the De Dion type; it is located in the rear portion of the vehicle and is capable of working up to 2 h.p. at a speed of 800 revolutions per minute; the ignition is electrical and the cooling of the cylinders effected by means of radial discs. Two illustrations of the De Le Croix motor, which is of Belgian origin, are given in Figs. 4 and 5. It will be seen that both pistons are linked to one crank pin on the shaft, *E*. Only one sparking plug is provided, an impulse to each piston being given simultaneously. The carburettor is also of the De Dion type. Since this vehicle was first introduced into this country, considerable changes have been effected in the transmission gear. The vehicle exhibited is incomplete, but when finished the power will be transmitted from the motor to the rear axle of the machine by a belt which, normally running slack, can be tightened by a jockey pulley, thus enabling the motor to be started before the vehicle is put in motion, and also the motor cut out from the trans-

mission gear, when riding through traffic. A maximum speed of from 12 to 14 miles per hour can, it is stated, be attained by the vehicle.

The exhibit of Mr. E. A. McLachlan, of 55 Brighton Road, Stoke Newington, is interesting from several points of view, particularly from the fact that it is the only vehicle fitted with a heavy-oil motor in the Exhibition, and also of its low price. It is a two-seated three-wheel car (Fig. 6) fitted with a single-cylinder horizontal motor at the rear, which, working with ordinary paraffin oil, gives  $2\frac{1}{2}$  a.h.p. The ignition is by

FIG. 6.—THE McLACHLAN HEAVY-OIL MOTOR-CAR.

means of an incandescent tube, the lamp for the latter also heating the vaporiser. Two speeds are provided, the motor-shaft driving the counter-shaft by spur-gearing, while a couple of belts connect the counter-shaft with the rear axle. These belts normally run slack, and are tightened by jockey pulleys. The frame is built of steel channels; the body of the car, which completely encloses the motor and gear, being of polished walnut. The oil tank has a capacity of two gallons, stated to be sufficient for a run of 50 miles, while the tank containing the cylinder-cooling water will hold seven gallons. The road wheels are of the suspension type with pneumatic tires. Two brakes are provided—one acting on the fly-wheel of the motor, and one a band brake on the rear axle. The car, which weighs complete about  $7\frac{1}{2}$  cwt., is listed at only £75. Mr. McLachlan is also making a four wheel vehicle of the same type, with a differential gear, at a slightly higher price. Mr. McLachlan also displays a  $2\frac{1}{2}$ -h.p. electro-motor for launches; the armature is of the ring type—8 in. in diameter—and runs at 2,500 revolutions per minute. The motor is reversible, a metallic brush being employed.

Mr. F. C. Blake, of Ravenscourt Works, Hammersmith, who has been known in the automobile world for his electric ignition apparatus, exhibits for the first time a light two-seated carriage (Fig. 7), built in accordance with his own ideas. The motor is a horizontal two-cylinder one of the petroleum-spirit type; it is of 3 b.h.p., with water-jackets, and is located in the centre of the rear portion of the frame; its normal speed is 800 revolutions per minute. In the car on exhibition the ignition is electrical by means of small accumulators. It was not possible to completely finish the vehicle, as it finally will be, in time for the show. In this case, for example, Mr. Blake has only fitted the accumulators temporarily, it being intended to use an electro-magnetical device driven off the motor-shaft known as Dawson's. A carburettor of the Longuemare type is employed. Two speeds, about five and fourteen miles per hour, are provided. The motor-shaft carries a drum, which is connected by a single belt to a first counter-shaft, carrying one loose and two fast pulleys. Connected

to each of the fast pulleys is a pinion which gears with corresponding pulleys on a second counter-shaft. The belt-shipping lever is controlled by the foot and not by the hand as usual, this single lever being made to serve a number of purposes. The foot pedal works in a  $\Lambda$  slot in the floor of the carriage, and is arranged to take four different positions: (1) the high speed; (2) the low gear; (3) belt on loose pulley, motor thus running free; and (4) application of band brake. The first counter-shaft is carried in swinging arms, the belt being continually kept taut by means of a spring. From the second counter-shaft to the rear road-wheel axle the power is transmitted by a single chain. The wheels are of the suspension type with solid rubber tires. Steering is effected by means of a hand wheel controlling the front wheels. Another feature of the vehicle is the pneumatic spring device fitted to the fore-carriage frame. This is of the compensation lever type, allowing each wheel to rise and fall independently, according to the inequalities of the road, the strain being taken up by a centrally-located pneumatic pad encased between two metal discs. The petrol tank, which has a capacity of 8 gallons, is arranged in the front of the car, providing an additional seat for two persons. The car is started by means of a detachable handle, while all the working parts of the motor are readily accessible. The water tank is of large capacity and fitted with cooler sufficient for a day's run. The upholstery is in Morocco leather, and the back of the seat is carried up high enough to make a comfortable rest. The front mudguards are fastened to the front axles and move with the wheels, so keeping mud from being splashed over underframe and machinery. The car appears to run very quietly and with a minimum of vibration. Its weight complete is between 7 and 8 cwt. In addition to this car Mr. Blake is also showing his well-known induction

FIG. 7.—THE BLAKE TWO-SEATED MOTOR-CARRIAGE.

coil for the ignition of the charge in motors. They are fitted with large platinum contacts for continuous and heavy work, and the secondary winding is protected from damp and mechanical injury by a strong light covering from end to end. The coils give a very bright flaming spark, and are largely used by owners of motor-cars. The Blake portable accumu-

lator is another exhibit. This is of 2 volts E.M.F. and 35 ampère-hour capacity, made up in vulcanite case, with large rubber vent hole so that the plates can be seen. The cells are now supplied with lead terminals above the case instead of brass. Other exhibits at this stand are an improved Benz sparking plug, so arranged that the plug can be taken out without it being necessary to remove the flange; an improved Benz compression chamber in which the space is reduced  $\frac{1}{8}$  in. in depth, resulting, it is claimed, in an increased compression; a vertical two-cylinder petrol motor for launches; a small accumulator charging dynamo, which at 2,600 revolutions gives 6 ampères at 30 volts.

The Pretot Motor Syndicate, Ltd., of 24 Budge Row, E.C., show a comfortable-looking Victoria, fitted with a Pretot *avant-train*, an arrangement whereby an ordinary horse-drawn vehicle may be quickly converted into a motor-carriage. This arrangement, which is of French origin, consists of a fore-carriage on which the motor and the power transmission mechanism are mounted, the front wheels thus serving both for driving and steering, the whole forming an attachment by which any four-wheeled vehicle can readily be converted into a motor-carriage. The whole of the motor and transmission gear, with the exception of a tubular water-reservoir placed in the fore-part of the carriage, is contained in a box or casing placed upon the axle, and practically the only alteration required in the carriage is the provision of two holes in the foot-board—one for the steering-gear, and the other for the lever that regulates the speed. The engine frame, and with it the front wheels, are kept in position by a central shaft, which also serves as the steering spindle. The motor, which

FIG. 8.—SECTION OF PART OF PRETOT SPEED CLUTCH.

is a petroleum-spirit one, is of the horizontal, twin-cylinder, water-jacketed type. It is arranged on one side of the frame over the axle, and, running at 700 revolutions per minute, is claimed to develop 5 h.p. The power is transmitted by gear wheels to an intermediary shaft, and from the latter to the axle by sprocket wheels and chains. Underneath the foot-board of the carriage is a disc plate, fitted with castor-wheels, which run on a ring of equal diameter to the upper plate, bolted to the lower frame-work. The whole of the motor and transmission mechanism is enclosed in a case or cover, which measures approximately 3 ft. 6 in. by 2 ft. Steering is effected by means of a hand-wheel mounted on a spindle, on the bottom of which is a small pinion, which is engaged with teeth on the inside of the ring on the top of the motor fore-carriage.

The speed-varying gear is of a novel form, three forward speeds and one reverse being provided. The gear is mounted on an intermediary shaft, and comprises the pinion wheel *A*, keyed on the shaft *b* (Fig. 8). In bearings in this wheel or disc are journaled a number of short studs *a, a*, each of which carries a group of pinions *E', F', G', and H'*, and on the opposite side a single pinion *D* gearing with a pinion *C*, loose on the shaft *b* and connected to a sprocket-wheel *B* from which the road wheels are driven. Each of the pinions *E', F', G', and H'* gears with wheels *E, F, G, and H*, having on their bosses brake-discs *I*. By means of brake-straps *I'*, any one of the wheels *E, F, G, and H* may be held stationary, and the motion of the driving wheel *A* conveyed to the wheels *C* and *B*. The wheel *H* is made smaller than *C*, so that when

it is in gear the motion of *C* is reversed. The action of the gear, which is controlled by a single lever, is as follows: Suppose *A* is revolving at a constant speed, and the four wheels *I* are allowed to turn freely, the brakes being loose, then *C* will not rotate, but *D* will revolve as it circles round *C*, and will impart motion to *H', G', F', E'*, and they to *H, G, F, E*, in proportion to their relative sizes. Now, suppose the brake is applied firmly to *E*, then, as *A* revolves, *E'* rotates

FIG. 9.—TRANSVERSE SECTION OF PRETOT SPEED CLUTCH.

at a speed proportional to the difference in diameter between it and *E*, and imparts motion to *D*, which in turn passes it on to *C* and *B*, and so to the driving wheels. The two other wheels *G F* give lower speeds, but when the pair *H' H* are put in action the driving is reversed, and the carriage goes backwards. The brakes and brake wheels *I* are controlled by four cams *c* (Fig. 9), actuated by a hand lever within convenient reach of the driver.

The Pretot Motor Syndicate, Ltd., are also showing a little two-seated car, built by Messrs. Brown & Buckton, of 14 Crossley Street, Halifax. The motor is a horizontal petroleum-spirit one, with two cylinders, working up to  $3\frac{1}{2}$  h.p. The ignition is electrical, while the cylinders are fitted with a water-jacket. Two forward speeds and one reverse motion are provided, the transmission being effected by belts and chains.

Stirling Motor Carriages, Ltd., of Hamilton, N.B., have an exhibit of four excellently-finished Daimler cars. The motor and transmission mechanism of these vehicles is of the Daimler standard type, and needs no description at this time. The "Hamilton" dog-cart, to seat four persons, is fitted with a  $5\frac{1}{2}$ -h.p. Daimler motor. The body of the vehicle is of varnished walnut, while the under-carriage is painted umber, lined out in straw colour. The road wheels are fitted with  $2\frac{1}{2}$ -in. solid rubber tires. The upholstery work is in morocco leather, the whole turn-out being of a handsome kind. The next vehicle is what is known as the Miniature Tourist Car. It is fitted with a  $5\frac{1}{2}$ -h.p. Daimler motor, and arranged to seat four persons, there being a comfortable arm-chair front seat, and two seats at the back on wagonette principle, accommodating two persons. Accommodation for baggage is provided, while the car is furnished with extra storage tanks, so rendering the vehicle, as its name implies, particularly well adapted for touring purposes. We next inspected the "Brandon" brougham. The entrance to this car is arranged at the front next to the driver's seat; provision is made for two inside passengers, although two folding seats for children are also provided. The interior of the vehicle is upholstered in old gold silk plush, the body is painted black and brown, the wheels and undercarriage being grey, lined out in old gold colour. The last exhibit of the Stirling-Daimler cars to be noticed is a family omnibus to seat eight persons. The roof of this vehicle is made detachable, so that it may be readily converted into an open wagonette. The motor is of  $5\frac{1}{2}$  h.p., of the standard type, the wheels

being fitted with solid rubber tires. Altogether these cars are excellent specimens of workmanship, and have been greatly admired during the past week.

Considerable attention has been attracted by the twenty-seated Stirling-Leyland steam omnibus shown by this Company. The "body" of the car is the production of Messrs. Stirling, while the boiler, motor, and transmission are the construction of the Lancashire Steam Motor Co., of Leyland. The boiler is located in the front portion of the car; it is of the fire-tube type, and is constructed for a working pressure of 200 lb. The water is fed to the boiler by means of a small brass feed-pump, which is set to give a constant feed. The vehicle is fitted with an air condenser, which weighs only 95 lbs., on the roof of the cab. Liquid fuel is employed to generate steam. The system adopted provides for the automatic regulation of the supply of the oil fuel to the burner, the regulator being divided by a slightly flexible steel diaphragm into two chambers, the upper of which is in communication with the steam space of the boiler, whilst the lower contains the upper end of the oil valve spindle, which is kept in contact with the under surface of the diaphragm by means of a spiral spring. The burner proper is a casting suspended inside the fire-box of the boiler by a coil of piping, the oil being forced by compressed air through the regulator to the burner, and vaporized on its passage to the orifice. The burner is started by igniting a handful of shavings or paper beneath it, and allowing a small quantity of oil to pass. As soon as the burner becomes sufficiently hot, oil vapour issues from the fire hole beneath the centre of the air cone, and ignites at the top of the cone. The flame thus produced is deflected outwards by the chamber on the upper portion of the burner, so that the fire-box is filled with flame. When the steam acquires the desired pressure the deflection of the diaphragm causes the closing of the oil supply valve, and this valve is re-opened by the action of the spiral spring already referred to when the steam pressure is reduced. The supply of oil to the burner is thus so regulated that steam pressure should be maintained automatically. The engine is of the compound, vertical two-cylinder type; the cylinders being  $2\frac{1}{2}$  and  $5\frac{1}{2}$  in. in diameter. A small pump is driven off the main shaft and forces lubricating oil through special channels to the engines and driving-shaft journals. Three forward speeds and one reverse motion are provided. Spur gearing is used to transmit the power from the engine-shaft to the first counter-shaft, reverse motion being effected by means of a clutch. Hans Renold's chains form the connection between the first counter-shaft, the differential gear, and the driving wheels. The vehicle is fitted with two brakes, a band brake on the first counter-shaft and shoe brakes on the rear road wheels. The former is actuated by a foot lever, the latter by worm gearing. The water tank holds 26 gallons and the oil tank 18 gallons. The vehicle is roomy inside, well ventilated, and extremely comfortable. The windows, which are large and give a light and airy appearance, are made movable. They are hinged at the top and can be opened or closed as required, or they can in summer be entirely removed from the vehicle. The carriage therefore can be used either as a closed bus or open brake or *chairs-a-banc*.

We briefly alluded in our last issue to the light four-seated dog-cart (Fig. 10) exhibited by Higgs' "Champion" Car Syndicate, 17 Ironmonger Lane, London, E.C. The motor in this car is a De Dion  $1\frac{1}{4}$  h.p., but it is intended to fit future cars with a more powerful motor. The motor and the whole of the transmission gear is arranged under the "body," so

that none of the working parts are visible. The motor drives by pinions a first counter-shaft, which in turn is geared by a belt, working on fast and loose pulleys, to the rear axle. Only one speed is provided in the car exhibited, but it is intended to fit a two-speed gear in future. The starting of the motor is effected from the front seat by means of a foot-pedal, which terminates in a rack in gear with a ratchet wheel on the second counter-shaft. A hand lever is provided which serves a three-fold purpose, its operation controlling simultaneously the application of a band-brake, the cutting off of the electrical ignition, and the shifting of the belt on to the loose pulley. The steering arrangement is also of a new type. The lower end of the steering pillar is rigidly connected to one end of a horizontal short arm, to the other end of which is fixed a short vertical rod fitted with a roller. This short rod works in a recess formed in the lever connected to the steering wheels. Both the front and rear axles are provided with helical springs. The car weighs complete about 4 cwt. The road wheels have wooden spokes, with solid rubber tires.

Messrs. Noé Boyer & Co., of 30 Avenue de la Grande Armée, Paris, make a very imposing display of their Phébus

FIG. 10.—HIGGS' "CHAMPION" MOTOR-CAR.

motor-tricycles and quadricycles, which are all fitted with Aster motors. Three tricycles are shown, including a racing machine, and a very highly finished quadricycle. The suspension of the front seat of the latter is well provided for, the seat being supported on the frame by both C and plate springs. Messrs. Boyer & Co. also exhibit a very ingenious front seat attachment for converting a tricycle into a two-seated quadricycle, the seat of which, when not in use, can be folded up into a kind of box. The feature of the Phébus motor-cycles is the "Aster" motor with which they are fitted, and which is made by Les Ateliers des Constructions Mécaniques "L'Aster," of 33 Cours Benoist, Saint-Denis (Seine), France. The chief feature of the motor (Fig. 11) is to be found in the *ailettes* or radial discs fitted round the cylinder to effect the cooling of the latter. These discs, instead of being cast with the cylinder, are made of corrugated copper, and it is claimed for them that they will disperse six times as much heat as an equal surface of cast iron. The motor can be arranged for either electric or tube ignition, although the former is generally employed; the exhaust valve is actuated in the usual way by a cam on a small shaft driven by spur wheels off the crank shaft. The motor occupies a very small space, and, while weighing only 66 lb., is claimed to develop  $2\frac{1}{4}$  h.p.

In connection with this motor a new form of carburettor (Fig. 12) is employed, the claim for which is that it will work regularly, even when the machine is travelling over rough roads. It consists of a copper cylinder of a capacity of five litres. The petrol is introduced at *A*; *F* is a float of a special form, the top of which carries a copper plate *P*. To this plate is fixed a tube *C*, which extends right to the top of the tank, passing on the way through a diaphragm. This tube *C* is pierced at its upper end with small holes covered with a wire gauze. Within the tube *C* is a rod, terminating in a small conical cork float, while at the top of the outside of the tank is a double valve, one part of which controls the admission of fresh air, while the other controls the quantity of explosive mixture allowed to pass to the motor. The tank is

FIG. 11.—THE "ASTER" MOTOR.

FIG. 12.—SECTION OF "ASTER" CARBURETTOR.

provided with a double bottom, a part of the exhaust gases being conveyed through it to give a slight preliminary heating to the petrol. The air drawn in by the motor enters by the pipe *C*, and passing down the tube meets and is dispersed by the float *B*, over the surface of the petroleum-spirit. The carburetted air then rises into the dome of the tank, passing through a wire gauge, which serves to prevent any chance of a return flame in the carburettor. From the dome the carburetted air passes through the double valve to the motor in the desired quantity, and mixed with the requisite amount of fresh air. The Phébus motor-tricycle with Aster motor has already met with a large adoption in France, and judging from the reception it has met with at the Exhibition it is likely to be soon very popular in England.

A motor-tricycle fitted with a new type of petroleum-spirit motor is that which is shown by La Société des Moteurs Sphinx (Damas & Clément), of Levallois-Neuilly, France, and 58 Holborn Viaduct, London, E.C. The motor (Figs. 13 and 14) has a cylinder 70 mm. diameter by 70 mm. stroke; at a speed of 1,800 revolutions per minute it will, it is claimed, indicate  $2\frac{1}{2}$  h.p. The motor shaft is in two parts, each carrying on their inner ends, within a phosphor-bronze oil-containing case, discs which take the place of the usual crank, the oscillating piston rod being connected to a short shaft carried by the two discs. The inlet and exhaust valves are placed one above the other in such a way that they can readily be removed for cleaning purposes, etc. The ignition is effected electrically, a spark due to the sudden breaking of the circuit being employed. The motor, which is provided with radial discs not only to the cylinder walls but also to the outsides of the two valves for cooling purposes, is stated to weigh only about 60 lb.

Several examples of the motor are on view, apart from

the tricycle, the firm supplying these to builders of motor-tricycles. The petrol tank and carburettor is of the De Dion type. Messrs. Damas & Clément are also making a two-cylinder motor of the same type for light voitures. The two cylinders are set in the same plane, but at an angle to each other, the piston rods of the two cylinders being connected

FIGS. 13 AND 14.—SECTIONAL ELEVATION OF "SPHINX" MOTOR AND DIAGRAM OF EXHAUST-VALVE CONTROL.

to the same crank. The two cylinders are arranged with independent petrol supply pipes, the sparking gear being also independent, so that one of the cylinders can be cut out when not required, as, for instance, on a slight down grade. The ignition device is arranged to give an impulse in each cylinder alternately, the two-cylinder motor being capable of working up to 4 h.p.

The Star Cycle Co., Ltd., of Wolverhampton, are exhibiting through the Automobile Association, Ltd., of Notting Hill, W., a couple of their new "Star" light motor-

FIG. 15.—THE "STAR" MOTOR-CAR.

carriages (Fig. 15). These cars follow Benz lines, but are throughout of English construction. They are fitted with a

"Star"  $3\frac{1}{2}$ -h.p. single-cylinder petroleum-spirit motor, and are capable of taking three persons up the steepest gradients. Electric ignition is used, and a throttle valve, conveniently placed on a level with the seat, renders the management of the car very easy. The transmission is by means of belts and driving chains. Two speeds are provided, as also a starting gear, and two independent brakes. The wheels are of the tangent spoke type, and the whole carriage finished in the best style.  $\frac{3}{4}$ -in. balls are used for the bearings. On a good smooth road they are adapted to run from any speed up to twenty miles per hour. Each carriage is fitted with two powerful brakes which are capable of stopping it on the steepest down grade. Each car for the electric ignition is provided with a double set of accumulators, each of which will, it is stated, work continuously for 350 miles.

The Endurance Motor Co., Coventry, on Saturday last brought in for exhibition one of their new two-seated vehicles, which has a very smart and fast appearance. The body of the car is entirely distinct from the frame. The motor is somewhat on the lines of the Benz, but is of English construction throughout. The engine is of 4 h.p., the cylinder being 5 in. diameter by 5 in. stroke; the ignition is electrical, while the cylinder is water-jacketed. Two speeds are provided, the transmission being effected by belts working on fast and loose pulleys. All the control handles are mounted on the steering standard, the shifting of the two belts being controlled by a single handle. The wheels are of the cycle type, with tangent spokes and Dunlop pneumatic tires. The London agency for the Endurance car has, we learn, been secured by Mr. J. Burns, of 44 Berners Street, W.

Messrs. De Dion, Bouton & Co., of Puteaux, France, had intended to make a large display of their productions, but unfortunately were unable to send over more than a couple of machines—an ordinary motor-tricycle with  $1\frac{3}{4}$  h.p., and a similar machine convertible to a two-seated quadricycle. The latter is of a very attractive appearance, the additional seat being upholstered in light brown leather. This machine is meeting with immense success throughout France, as it is admirably adapted for carrying a lady companion. It is geared down low, so that it can climb almost any hills without pedalling, and up very stiff hills with a very slight assistance from the pedals. The front part is fitted on easy springs, which make the machine comfortable and renders the steering most simple. The productions of the De Dion-Bouton firm are too well known to need any lengthy reference at this time, but it may here be mentioned that the firm is about to introduce a motor of  $2\frac{1}{4}$  h.p. in place of the  $1\frac{3}{4}$  h.p. hitherto employed.

Messrs. Farman & Co., of 25 Rue de la Paix, Paris, exhibit a well-finished motor-tricycle, with  $1\frac{3}{4}$ -h.p. De Dion, of the *cloche* type. The machine is provided with two band-

from wet, etc. Messrs. Farman are also showing a front-seat attachment for a tricycle, so that the latter may be quickly converted into a two-seat quadricycle. A large range of motor-cycle accessories, including sparking plugs, induction coils, lanterns, etc., is also displayed.

We have already mentioned in this journal that Messrs. Brown Bros., Ltd., of Great Eastern Street, E.C., the well-known cycle and cycle accessory factors, are engaging extensively in the motor trade; consequently it is not surprising to find them making a large display at the exhibition. Their display includes not only motor-tricycles and quadricycles, but also motors and fittings to enable cycle makers and others to build motor-tricycles. The tricycles shown are all fitted with De Dion motors, both of French and English construction. The "Perfecta" tricycle, made by Messrs. Darracq of Paris, has a De Dion motor, fitted with a two-speed gear, arrangements being also provided so that the motor can be cut out from the transmission gear. A "Perfecta" quadricycle fitted with the same change speed gear is also on view. The workmanship throughout appears to be of a high-class character. On the stand is also to be seen a large display of motor-car and cycle accessories, including hubs, chains, chain wheels, sparking plugs, carburettors, etc., as also a new alarm for use on motor-cars. The latter is known as the "New Departure," and is arranged to be operated by the foot. The bell, which is largely used in America, gives a very loud alarm, and is simply controlled.

Another addition has been made to the stand of the Automobile Association, Ltd., of Notting Hill, W., during the past week in the shape of the Waverley electrical "Runabout." This vehicle, which from its smart appearance and high finish has attracted considerable attention, is of American construction, being made by the Indiana Bicycle Co., of Indianapolis. The framework of the running gear is tubular, with brazed joints. All wheels have ball bearings, wire spokes, and pneumatic tires. The motor, which is of the multipolar type, is rigidly hung to the frame, and it and all gears are covered, amply protecting them from dust and water. The motor-shaft is geared directly to the two rear wheels by a single reduction. Each rear wheel is made to revolve independently of the other by compensating gears placed in line with the motor shaft. The motor is of  $1\frac{1}{2}$  h.p. The battery employed is of a new type, and is claimed to be less than half the weight of the storage cells used in other vehicles of the same capacity. It consists of forty-four cells, varying in size from 60 ampère-hour to 125 ampère-hour capacity, according to the power desired, the weight of the lightest being about 9 lb. for each cell. They are arranged in four trays of eleven cells each. The normal discharge rate of the battery is about 15 ampères, at which rate the car runs at a speed of from twelve to fourteen miles per hour. A watt-meter is conveniently placed, enabling the operator to see at any time at a glance the amount of energy in store. A simple ratchet lever set on notches for starting the vehicle, regulating speed, etc., is placed at the extreme left side of the seat, and actuates a controller beneath the seat. The slowest speed is obtained by grouping the four trays in parallel, the second by grouping two trays in parallel and two in series, the third or highest speed by four trays in series. The current delivered to the motor for each of the speeds is stated to be practically constant, but the speed of the motor and the current delivered from each tray of batteries vary directly with the voltage, thus making the consumption of energy at all times proportional to the speed. The carriage is reversed by a key placed directly below the controller, the turning of which simply reverses the polarity of the armature. The removal of this key makes the vehicle inoperative. A band brake is applied to the periphery of the compensating gear drum, and is operated by a foot-pedal. The capacity of the battery is stated to be sufficient for a run of thirty-five miles.

Mr. Carl Oppermann, of 2 Wynyatt Street, Clerkenwell, E.C., displays a very neat electrical Victoria, which is, we learn, being largely taken up on the Continent for service in

FIG 16.—LA SOCIÉTÉ PARISIENNE "VICTORIA COMBINATION."  
(For description see last issue.)

brakes, one on the differential gear and one on the front wheel. The induction coil is entirely closed, so being shielded

busy towns. The battery, which consists of forty-two cells of Mr. Oppermann's own type, is slung by steel springs under the frame of the carriage. The weight of the battery is stated to be only about  $7\frac{1}{2}$  cwt., while its capacity is sufficient

FIG. 16A.—THE OPPERMANN ELECTRICAL VICTORIA.

for a run, in towns, of about sixty miles. The motor, which is located in the rear portion of the vehicle, runs at 1,600 revolutions per minute; and, while its normal capacity is 3 h.p., it is capable of working up to 7 h.p. The motor is located in the rear portion of the vehicle under the passengers' seat. From the motor shaft the power is transmitted through silent hide gear wheels to an intermediary shaft, provided with a differential gear, and from the latter to the rear road wheels through sprocket wheels and chains. All the motions—starting and stopping, reversing the motor, and the application of the electrical brake—are controlled by a single handle. Three forward speeds—the maximum in the Victoria being eleven miles per hour—and one backward motion are provided. Steering is effected through the front wheels by means of a hand wheel. The steering wheels are not mounted on the usual vertical pivots, but on an ordinary axle, the steering effected being through a special turn-table, fitted with a double reduction gear, by means of which the car can turn in a very small space. In addition to the electrical brake, band brakes acting on drums on the rear wheels are provided, these brakes being controlled by a foot lever and flexible cable. The weight (Fig. 16A) of the Victoria is 23 cwt. Mr. Oppermann has also lately completed a new electrical car, in which the whole of the motor and transmission gear is mounted on the fore-carriage, occupying but a very small space, the

noiselessness of the vehicle being another feature. In the course of a chat with Mr. Oppermann, we learn that he has lately secured an order for fifty of his electrical vehicles for service in Vienna. These cars will be provided with a standard tubular frame, carrying the motor and transmission gear, etc., in such a way that any type of body may be fitted.

A very neat-looking electrical vehicle is the four-seated Victoria (Fig. 17) exhibited by Mr. E. H. Clift, of the Sinclair Motor Works, Sinclair Road, Kensington, W. The car, which can be fitted with a detachable "tiger" seat at the rear, is provided with a battery of 40 accumulators arranged under the seats. The cells are of a special type, having Headland positive plates and Clift negatives; the weight of the battery is 1,200 lb., one charge being sufficient for a run of 50 miles over ordinary roads. The battery is arranged to be recharged *in situ* from either a 50 or 100-volt circuit, an operation which can, if necessary, be done in two hours. The electro-motor is of the series type, of 3 normal h.p., but capable of working up to 6 h.p. The speed of the motor, which is reversible, is 1,200 revolutions per minute. The motor is located under the centre of the car and is geared to the counter-shaft by raw-hide pinions and from the counter-shaft to the rear road wheels by sprocket wheels and chains. A two-speed gear controlled by friction clutches is fitted on the counter-shaft. The controller is arranged to give three forward and three reverse speeds—4, 8 and 16 miles per hour—while an extra-special speed—18 miles—is provided, controlled by the heel of the foot, for quick manœuvring in traffic. The road wheels have wooden spokes and solid tires. Two brakes are provided—a band brake operated by a foot pedal, and acting on the differential, and shoe brakes controlled by a hand lever on the rear wheels. The weight of the Clift car complete is 25 cwt.

An addition has been made to the stand of the Crowds Accumulator Syndicate, Ltd., Bridge Place, Eccleston Place, London, S.W., in the shape of Armstrong's electric parcel

FIG. 17.—THE CLIFT ELECTRICAL VICTORIA.

carrier. This is a light four-wheeled vehicle fitted with a small battery of Crowds accumulators. A seat for a driver is arranged at the rear, the chest being in front.

The Joel Electric Carriage Motor and Battery Syndicate, Ltd., E.C., have an exhibit of interest to the electrical engineer. Prominent on the stand is the electrical brougham illustrated and described at length in our issue of March 17th last. The car weighs complete about 20 cwt., including a battery of accumulators weighing 8 cwt. There are two 2-h.p. motors; three speeds, 4, 8 and 12 miles per hour are provided, as also reverse motions, while the car can run a distance of thirty miles on one charge. Another exhibit is Joel's standard elastic frame, fitted with motor and transmission gear, to which any type of body can be attached. The Joel Company are arranging to supply this type of frame, with motor, etc., attached, to carriage builders, so that the latter may fit their own "bodies." One of the Joel electro-motors is also to be seen on the stand; it is of 2 h.p. and runs at 600 revolutions per minute, the weight being only 112 lb. The motor, which is reversible, is guaranteed to have an efficiency of 80 per cent. Another speciality of this concern is the Rosenthal battery, which is claimed to be exceptionally light, having regard to its output—the weight per cell being 22 lb. and the output 140 ampère-hours at 20 to 40 ampères discharge rate. The plates are of the perforated pasted lead type, giving  $17\frac{1}{2}$  watt-hours per lb. of plate. The cells are made up in trays of nine, so as to be easily handled.

Mr. Percy H. Frost-Smith, of 68 Coleman Street, London, E.C., is present with an electrical dog-cart on the Riker system. The car is provided with a 3-kilowatt electro-motor and has three forward speeds ranging from 2 to 12 miles per hour, and three backward motions. The feature of the car is, however, to be found in the battery, which consists of forty cells of a new type of accumulator, known as the H. and H. The cell, which has a capacity of 100 ampère-hours, is constructed on the pasted plate method and weighs, including the acid and the rubber case,  $32\frac{1}{4}$  lb., the total weight of the battery of forty accumulators being given as 1,378 lb.

Mr. G. Hopkins, Clun House, Surrey Street, Strand, London, W.C., exhibits an early type of Serpollet steam carriage, arranged to seat four persons. The car is of the 1897 type, many improvements having, however, since been introduced by Mr. Serpollet in his steam-propelled vehicles.

The Whitney Steam Wagon Co., of Boston, U.S.A., show one of their light steam-carriages, the first one of the kind to be seen in England. Some brief particulars of the car will be found under "Comments" in another column of the present issue.

A very ingenious variable-speed gear is that which is shown by Mr. Ralph Lucas, of Upper Siebert Road, Westcombe Park, S.E. The device, as will be seen from Fig. 18, consists essentially of two pulleys automatically expanded by springs, each driving by belts on to an intermediate twin pulley, so that by shifting the position of the twin pulley, relatively to the two expanding pulleys, the one is allowed to expand while the other is forced to contract in diameter; so changing the ratio of their diameters, thus giving a change of gear. The intermediate twin pulley is carried on a spindle, which in turn is mounted on pivoted levers, so that the pulley can be moved either forward or backward, either by a hand lever or screw. The first experiment in developing the device was, we learn, to make up a pulley in segments which parted as the pulleys expanded. With this method, however, the belt made a great noise in striking the segments one after the other when the pulleys were run at a high speed. A way had then to be found to envelop the pulley with a ring which would give good belt service and at the same time would run silently. This has been done by making up a ring of lattice work in steel lazy-tongs fashion, in such a way that the strips on which the belt lie arrange themselves helically, so preventing the noise due to the belt striking each segment separately. In order to keep this ring in a uniform circle and capable of being

uniformly expanded and contracted from any point round the circle by applying pressure, the ring is mounted on a series of supporting bars, which are controlled by a system of toggles. One end of each of the latter is fixed to a star plate free to revolve on the shaft of the pulley, the other end of the toggles being attached to the supporting bars, the end of which slide in radial slots in plates fixed to the shaft on the

FIG. 18.—THE LUCAS VARIABLE SPEED GEAR.

two sides of the lattice. These slots act both to take the drive of the belt and to complete the toggle action; thus by revolving the star plate relatively to the radial slotted plate the toggles slide the supporting bars up the radial slots, so expanding the pulley. This function is performed by six tangentially-arranged springs. A further use of this gear is obtained by placing stops on the driven pulley near the full extent of its range, by means of which the driven pulley reaches the limit of its expansion before the driving pulley has reached its minimum. The result of this is that as the driving pulley is finally being reduced down to its smallest diameter the driven pulley reaches the stops, so ceasing to keep the belt tight and performing the function of a friction clutch for starting and stopping by allowing the belt to slip. The pulleys—driver and driven—are arranged to expand from 6 in. to 1 ft., and have a range of speed variation from *nil* up to 4 to 1. Not only does the device act as a variable speed-gear but it provides an automatic belt tightener and also obviates the use of a friction clutch. The gear is undoubtedly ingenious, and has attracted considerable attention at the exhibition.

A new safety lock-nut bolt (Fig. 19) forms the exhibit of the Evinof Safety Lock-Nut Bolt Co., Ltd., of 94 Victoria Street, London, S.W. That a simple locking arrangement

FIG. 19.—THE EVINOFF SAFETY LOCK-NUT BOLT.

is a desideratum no one acquainted with engineering can deny, for the places where such a device will prove useful

are exceedingly numerous. In motor-vehicles in particular a simple and comparatively inexpensive locking arrangement for bolts should prove invaluable. The new safety lock-nut bolt is the invention of Dr. Evinof, and, briefly described, consists of a pin and collar of mild steel. The pin and collar are in one piece. The collar or clip fits over the nut when screwed well home, and is immovably fastened by the pin being passed through a hole drilled through the bolts close to the end, and then slightly bent over with a blow from a hammer. The drilling of the hole through the bolt end in no way weakens it, and this operation and the provision of the collar are all that are needed to convert the usual nut and bolt into a safety lock-nut bolt. The bolts are now, we understand, in extensive use for a variety of purposes.

A novelty in the way of bicycles is the one shown by Mr. W. Bettis, 48 Arthingworth Street, Stratford, E. It is described as a wind motor-bicycle, the feature being the employment of a fan on the "head" of the machine, connected by a rotating shaft and spur wheels to the bottom bracket spindle. By means of the fan it is claimed that a stiff head-wind, instead of hindering the progress of the machine, is made to assist in its propulsion. Mr. Bettis has given a number of demonstrations of the riding of his machine in the arena, but we have still to be convinced that the wind-motor has more advantages than drawbacks.

Messrs. Lawrence & Co., Ltd., of 132 Latimer Road, London, W., are showing the Grouvelle-Arquembourg water-cooling tubes, of which an illustrated description was given in our issue of June 16th last. This device, which is largely used on motor-vehicles in France, is made with pipes of two sizes. For motors indicating up to 8 h.p., pipes 15 mm. internal diameter are employed, the length of the serpentine required being 2 metres per h.p. of the motor; for motors above 8 h.p. a serpentine with pipes 18 mm. diameter is made and recommended, the length per horse-power being only 1.35 metres. The radiating plates, which can be either of iron or aluminium, as desired (the latter affording the advantages of lightness, and the feature that mud does not adhere to them), measure 40 mm. by 40 mm. in the smaller size and 50 mm. by 50 mm. in the large size. The weight of the serpentine is: Small size, with iron radiating plates, 2.8 lb. per metre; ditto with aluminium plates, 1 lb. 14 oz.; large size, with iron plates, 4 lb.; ditto with aluminium plates, 2 lb. 11 oz. Messrs. Lawrence, who are the sole licencees for these tubes in Great Britain and Ireland, claim that by means of this water-cooling apparatus it is possible for a petroleum motor-car to be driven a distance of 200 kilometres at an average speed of 20 kilometres (12½ miles) per hour without it being necessary to take in a fresh supply of cooling water. Messrs. Lawrence are also exhibiting specimens of the Velox pipe joint, in which the use of solder or brazing material is obviated. The joint is made metal to metal, no packing being required. The pipes are simply squeezed one against the other, and in this manner an absolutely tight joint even under very high pressures can, it is claimed, be made. The pipes can be easily disconnected and connected again. The joints are made by forming a collar at the ends of the pipe with suitable tools, before doing which the flanges or unions are slipped over the pipe and afterwards screwed up.

The North British Rubber Company, Ltd., Castle Mills, Edinburgh, are present with a display of their well-known solid rubber tires for motor-vehicles, and also Clincher pneumatic tires for cycles. This Company are also now introducing a pneumatic tire of the Clincher type, suitable for light motor-cars, specimens of which are to be seen at the stand; an illustration of this stand is given in Fig. 20.

Mr. William Howard, 13 Theobald's Road, London, W.C., has on view several sizes of a steel-protected pneumatic tire, which is made in several forms suitable for light cars weighing about 5 cwt. up to 4-ton vehicles. The felloe of the wheel is surrounded by a steel rim, with ridge projecting outwards, shrunk on in the usual way and also retained by bolts. The wearing surface of the tire consists of a second steel rim, with a similar projecting ridge, having two grooves

or recesses running circumferentially on its inner surface. The pneumatic tube and its covering occupies a position between the two steel rims, and consists of a vulcanized rubber tube, covered by a double canvas lining, waterproofed on its inner surface. The tube and the lining are unattached. The tube is again protected by a second double canvas lining and finally by a thick hand-sewn cover of hide, which forms the outside of the flexible part of the tire. Close to the free edges of the outer hide covering (which open outwards) holes are bored at equal distances to receive lacing. Next to these holes stout strings or bands of leather of double or treble thickness are firmly attached by rivets. These when in position exactly fill the grooves or recesses in the outer rim. The edges of the hide cover and the enclosed linings are brought together, and the whole secured by cord lacing. The tire when inflated secures itself firmly by pressure to the outer rims, the outer one being locked and held in position by this means; but in order to prevent any possibility of its being accidentally detached by a sudden and heavy shock, the outer rim is fixed to the leather bands of the leather cover by screws. The first canvas linings, together with the hide cover, are themselves secured by means of short bands of iron, which are firmly retained in position by bolts, which pass through them, the inner rim and felloe of the wheel. A tire of this type has been successfully used for some time on the wheels of an omnibus in London.

FIG. 20.—THE NORTH BRITISH RUBBER CO.'S STAND.

Messrs. Smith, Parfrey & Co., Ltd., of 141 Buckingham Palace Road, London, S.W., make a large display of wooden road wheels, of which they make a speciality. These range from wheels for light phaetons up to 'bus and heavy wagon wheels. The wheels, which are fitted with both solid rubber and iron tires, are used by several motor-car builders in this country, as also on many horse-drawn omnibuses.

Collier's Twin Tire Syndicate, of 15 Walbrook, London, E.C., exhibit a new tire for motor-vehicles and cycles. It consists of a combination of the pneumatic and solid tires, the pneumatic being between the wheel and the solid rubber, but both the pneumatic tube and the solid rubber tire are contained in one piece of fabric, or outer cover, by which great strength and durability is stated to be obtained. The advantages claimed for the tire are (1) freedom from puncture, as the pneumatic tube is kept well off the ground, and (2) narrow tread, the twin tire being deep without being broad.

The main feature of the exhibit of M. L. Bleriot, of

42 Rue de Richelieu, Paris, is a large acetylene lamp specially arranged for use on motor-cars. The lamp, which is the invention of Messrs. Letang & Serpollet, weighs 15½ lb., and with one charge of carbide will give a continuous light of 50 candle power for eight hours. The lamp throws a light a distance ahead of no less than 150 metres and a width of 8 metres. The Blieriot lamp is very largely used in France, being employed by all the principal members of the French automobile world, including such well-known racing men as Charron, De Kynff, etc., and when its merits become known in this country will no doubt be largely used by English automobilists.

## “MY FIRST EXPERIENCE WITH A MOTOR.”

By AN AMATEUR.

I SHALL not soon forget it. I did not take any lessons in the art of moting, simply because I had no time; business was too pressing. I only went up to London to see the thing and buy it, and then set to work in my spare moments at home to learn the mysteries of the machine by experience (a hard task-master) and the aid of a little guide book supplied by the makers.

After a few rides up and down a pleasant level road, I considered myself a first-class motist, and began advising my acquaintances to “mote.” “Nothing to equal it—glorious! A lady could manage the car after about an hour’s teaching!” (So says the guide book). At the same time I was finding little phases in the behaviour of the car that I never dreamt of at first; for instance, it would pant, and jerk, and pant, and then stop without any instructions to do so, and without any cause that I could see, and of course along that part of the road where a few big houses with big people were; and some friends always found it convenient to be abroad at that time in that particular spot. Of course I had to get off; and if I had been foolish enough to bring any of my family I had to make them hop down while I lifted the back seat in order to gaze upon the “internals” and see what was wrong—that is, if I *could* see, for sometimes it seemed beyond mortal ken to discover the why and wherefore of the obstinacy.

Often it took a long time. It bothers a man to have a family continually harping on one string—“What’s the matter, father? Won’t she go?” and sometimes I longed earnestly for the seclusion of my back garden, where I might fight the matter out with the fly-wheel alone. And the motorless friends who always managed to whizz past at these awkward moments, on their bicycles, their horses, or their feet, bothered me with their loud “Good evening, Mr.—!” Some went quickly and called “Don’t blow up!” Some went slowly and said “Enjoying it, Mr.—?” and some inquisitive ones said “What’s the matter? Can I help you?” It was no use picking hedge roses or admiring sunsets to allay suspicion, for they stayed there, and even asked to “see the works going.”

Nevertheless I got on pretty well, and didn’t give up courage. In my ignorance I never dreamt of oiling springs and valves well on these occasions, and quite forgot that electric currents could be disturbed by foreign contact. I ignored (unwittingly) the facts that oil in the carburettor three days old could be *flat*, or electric wires could get loose, or that water supplies could run short. And, now, when I come to look back on it, I find that I tried to take pleasant runs with the oil and water gauges turned off, as they were, in the stable—that was forgetfulness, through having no one to remind me.

So I blamed the “mixture,” and when accidents happened set one of the family in the front to twirl the pointer from gas to air, from air to gas, and half-way between, an inch this way and half an inch that, in the hope of arriving at the right mixture, while I everlastingly tugged at the obstinate fly-wheel.

At last, one fine morning—I couldn’t find anything wrong with the car (I don’t know if there was much right)—I said to a special friend of mine who lives next door, “Come for a spin?” And the brave man came, and trusted himself with an *experienced* motor-car driver like myself.

Well, we really intended to run up and down the road till lunch, but everything went so nicely (no pistol-shots or other emotional sounds from within) that we decided to go for a longer ride. It was my first attempt of the kind. Of course, the thought of sufficient oil or water, or anything else, never suggested itself to my mind. The guide book did not inform us as to the time that a charge would last. I was learning in the school of experience and was in the infant class, so may be excused. Mine was a Benz dog-cart—a little beauty. I had cleaned the carcass that morning, and was quite proud of the outward appearance. That was enough. What the inside meant to do I did not know.

We made for the next town, about eight miles off. All went well. We cut a dash in the principal streets there, went at a good pace, and enjoyed ourselves so much that we tackled the high road to another town about twenty miles or more away. We thought of having dinner at a small village midway, but eventually decided to run straight on, as everything seemed so delightfully easy, and Providence was still kind. About a mile and a half outside the town we were making for, the machine began to slow down without any apparent cause, and in a few minutes came to a full stop. We both got down to inspect everything that we thought might want attention, and discovered the whole affair to be almost on fire, both oil and water having run short.

Out came the miserable little guide book (for I never ventured outside my own gate without it), and after perusing the numerous instructions for half an hour I concluded that I must take off my coat and get on my back under the car to try my “prentice hand” at engineering. The guide book informed me that on such occasions all nuts, etc., would need tightening. So I set to work (on my back), to the amusement of the public in general, and after a short but warm time I assured my friend that it was all right, and only needed oil and water. For this we started on foot to the town, leaving the motor in the care of the road mender, who (kind friend) happened to be there at his work.

We had our dinner, which we needed, and returned with a supply of oil. The water we got at a cottage near by. Imagine our astonishment when, having replenished and settled the thing as well as we were able, we could not get her to move an inch. Of course, I didn’t understand then that I had run the machine perfectly dry, burnt all the packing, and otherwise injured it, and that, under the circumstances, it was not likely to work. The so-called “guide book”—worn almost to a shred from constant perusal—instructed me in the remedies for these accidents, but never even whispered how to prevent them.

In the end, my friend and I had to hire the services of a butcher boy passing in his cart to tow us into the town. This we entered in triumph(?)—seated in state in our motor tied by a long rope to the back of the butcher’s cart, trying to look as though we had but been experimenting with the machine in some workshop in the wilderness. Of course the butcher smiled (he enjoyed it—so did his horse, I think), and, of course, we met plenty of people, and a whole rank of smiling “cabbies,” but we had to put the most dignified face we could on it, and take no notice of the horsey ones. We lodged the car at an inn and returned to our homes by train—an ignominious return, but we managed it after dark. I had a mechanic sent out next day to re-pack the cylinder, etc., and bring the car home, while I set myself with renewed vigour to the study of the guide book. I did not give up because my ignorance led me into such scrapes. Motoring is fascinating, and since I learnt to understand the machine I have had many long rides in it, for days together, over all sorts of ground. So my advice to beginners is: Don’t think you will get along so well with a guide book and no teacher.

## THE EVENING SPORTS AT THE MOTOR-CAR EXHIBITION.

**I**N connection with the above show a series of very successful tournaments have taken place every evening, and considering that this is the first thing of its kind that has ever been held in England we think the Committee has every reason for congratulation upon the results. Competitions have been held for carriages, which were steered up and down the arena through a number of figures, some very excellent steering being shown. The Electrical Undertakings, Limited, entered a very pretty little carriage which has been very skilfully handled, as has also the Hon. C. S. Rolls' Panhard & Levassor car. The tricycle steering has

bicycle v. motor causing much excitement. In the first race the bicycle won, but in the second the motor got in first.

Up to the time of going to press the principal winners have been as follows:—Car steering—Electrical Undertakings, Ltd.; Hon. C. S. Rolls; Benz. Tricycle steering—heads and posts, and lemon cutting—C. G. Wridgway, C. Jarrott, Hon. C. S. Rolls, and S. Farman. Dismantling—C. Jarrott.

The *finale* each evening has been a Balaclava melée, which members of the Volunteer cyclist corp and motorcyclists have taken part, their skilful riding eliciting hearty applause and adding much to the pleasure of the spectators. Some idea of this event, which will be repeated to-night (Friday) and to-morrow (Saturday) for the last time, may be gleaned by the sketch made by our artist.

THE EVENING SPORTS AT THE EXHIBITION.

proved very interesting, such well-known men as Messrs. C. Jarrott, C. G. Wridgway, Hon. C. S. Rolls, and B. Banks taking part. Another practical competition of considerable interest has been the dismantling of tricycles, the competitors having to take off the trembler, unscrew the platinum-tipped nut and disconnect all the electrical wires; they then had to connect them up and race round the arena, the first home being the winner. In the heads and posts and tilting the ring the motorists have every reason to be pleased with themselves, for they have handled their swords in quite a military manner. A Volunteer cycle corp has also given a very interesting display of lemon cutting, tent pegging, and heads and posts each evening. Although the space for racing was rather limited, some interesting contests took place, that of

The duties of judge each evening have been undertaken by Mr. F. F. Wellington, and the programme carried out under the capable direction of Mr. Frank Eason.

WE learn that Mr. T. Roland Outhwaite, Secretary of the Edinburgh Autocar Co., Ltd., has placed an order for a special Stirling-Pennington car, which is guaranteed to attain a minimum speed of twenty-seven miles per hour on the level, and is specially constructed to run over 130 miles without a stop. We understand that Mr. Outhwaite has designs on establishing some long-distance records in Scotland.

## THE MOTOR-CAR JOURNAL'S "COMMERCIAL EFFICIENCY" TRIALS.

—8—

IN connection with the Motor-Car Exhibition at present being held at the Agricultural Hall at Islington, a series of "Commercial Efficiency" trials of motor-vehicles is this week being carried out. The trials do not partake of the nature of "races," speeds of travel being only regarded as a minor point in determining results. The conditions of the trials have already been published in this Journal, but it may be mentioned that the principal points which will be taken into consideration in making the awards will be the following:—

Ability of the vehicle to run a given distance (according to class and type) out and home each day for *three consecutive days*, within the limits of a maximum and minimum given time for each class, without effecting repairs or reparations, and only having those adjustments made that may be necessary and strictly within the capabilities of an ordinary motor-car driver, without the aid of other appliances than the customary tool kit supplied with each car according to specification. It is not made an essential condition that the amounts of spirit, oil, and water, coal, coke, or electric current should form any criterion in making the awards. It is essentially a feature of the competition that no vehicle shall travel at a greater average speed than that permitted by law for each class of vehicle. A compulsory stop has been arranged as nearly as possible to mid-distance of the run.

The trials were divided into fifteen different classes, so as to include every type and size of motor-vehicle, and so great has been the interest taken in the trials that entries in nine different classes have been received. A start with the tests was made on Monday, when vehicles in three classes were started, altogether six vehicles leaving the hall; on Tuesday ten vehicles participated, while on Wednesday fifteen cars of different types were out on trial. In Class 1—"parcel vans propelled by petroleum-spirit motors and designed to carry a minimum load of 15 cwt. and two persons"—two vehicles, up to Wednesday, have competed. The route was to Welwyn and back, fifty miles, the minimum time allowed being 6 hours, the maximum 6½ hours, with a compulsory half-hour stop at end of journey. The results up to Wednesday evening are as follows:—

### CLASS 1.

Time occupied  
between  
leaving Hall  
and return.

| Name of Entry.                     | Day.        | Time occupied<br>between<br>leaving Hall<br>and return. | Observer's Report.  |
|------------------------------------|-------------|---|---|
| Motor Mfg. Co., Ltd., Coventry.    | 1st (Tues.) | 7 h. 1 m.   | Slow up hill, even on first speed. Stopped on return journey 5 min. to replenish petrol tank. |
| Do.                                | 2nd (Wed.)  | 6 h. 21 m.  | No incident.  |
| Daimler Motor Co., Ltd., Coventry. | 1st (Wed.)  | 6 h. 19 m.  | No incident.  |

Class 6, which is devoted to "pleasure carriages designed to carry not more than two persons, actuated by steam or petroleum-spirit motors, and carrying a full load during the trials," brought the largest number of entries, no less than six vehicles competing. The route in this case was from the Agricultural Hall to Baldock, *via* Hatfield, and back, a total distance of seventy-two miles. A compulsory stop of one hour at Baldock was required, and no car had to take less than 7 hours or more than 7½ hours for the journey. The times of the competing cars in this class are shown below:—

### CLASS 6.

| Name of Entry.                                   | Day.        | Time Occupied. | Observer's Report.   |
|--|-------------|----------------|--|
| Star Cycle Co., Ltd., Wolverhampton (No. 1 car). | 1st (Mon.)  | 8 h. 48 m.     | Frequent stoppages, both on outward and return journey, owing to motor over-heating. |
| Do.  | 2nd (Tues.) | 7 h. 48 m.     | Stopped once each outward and return journey for water.                              |
| Do.  | 3rd (Wed.)  | 7 h. 25 m.     | Ditto.   |

| Name of Entry.   | Day.        | Time Occupied.          | Observer's Report.  |
|--|-------------|-------------------------|---|
| Star Cycle Co., Ltd. (No. 2 car).                        | 1st (Mon.)  | (See Observer's Notes.) | Exhaust pipe required attention outward journey, 17 min. delay. Return journey a tire burst at Finchley, where car had to be left.  |
| Do.  | 2nd (Tues.) | 7 h. 48 m.              | Stopped once on journey each way for water.   |
| Do.  | 3rd (Wed.)  | 8 h. 19 m.              | Outward journey no incident. Return journey, accumulators gave out at Finchley.   |
| Daimler Motor Co., Coventry (Critchley car).             | 1st (Tues.) | 8 h. 33 m.              | 85 min. delay outward journey owing to belt-joint breaking, tire burst, and extinguishing of lamps. Return journey, 25 min. delay owing to belt-joint breaking, and water-pipe leak.                  |
| Do.  | 2nd (Wed.)  | 7 h. 36 m.              | Several stops owing to trouble with water circulation and pump.   |
| Marshall & Co., Manchester. (Hurtu car).                 | 1st (Tues.) | 7 h. 14 m.              | No incident.  |
| Do.  | 2nd (Wed.)  | 6 h. 49 m.              | Stopped once on outward journey to oil up and for water. Return journey, one stop for water.  |
| London Autocar Co. (Hurtu car).                          | 1st (Wed.)  | —                       | Had not returned at 10 p.m. owing to tire troubles.   |
| The Automobile Association, Notting Hill. (Cambier car). | 1st (Wed.)  | —                       | Car only got as far as Liverpool Road, Holloway, when in turning corner sharply vehicle skidded, dragging off a tire, and slightly damaging a wheel. Car returned to Hall without completing journey. |

In Class 7—"pleasure carriages designed to carry not less than four persons, actuated by steam or spirit-motors, and carrying a full load"—there were three competitors. The route was the same as in Class 6. Appended are the results to Wednesday:—

### CLASS 7.

| Name of Entry.                        | Day.        | Time occupied. | Observer's Report.   |
|---------------------------------------|-------------|----------------|--|
| Motor Mfg. Co. (4-seated dog-cart).   | 1st (Tues.) | 9 h. 38 m.     | Vehicle slow all outward journey, especially up hills; three stops, 5 m. for burners, and two stops for steering gear. |
| Do.                                   | 2nd (Wed.)  | 7 h. 16 m.     | Everything satisfactory.   |
| Motor Mfg. Co. (Iveagh phaeton).      | 1st (Mon.)  | 6 h. 59 m.     | No stop, no incident.  |
| Do.                                   | 2nd (Tues.) | 7 h. 9 m.      | Stopped three times—10 m. steering gear, 2 m. carburettor, and 4 m. ignition tubes.                                    |
| Do.                                   | 3rd (Wed.)  | 7 h. 0 m.      | Everything satisfactory.   |
| Daimler Motor Co. (Knighly Victoria). | 1st (Mon.)  | 6 h. 52 m.     | No incident.   |
| Do.                                   | 2nd (Tues.) | 7 h. 3 m.      | Do.  |
| Do.                                   | 3rd (Wed.)  | 6 h. 55 m.     | Do.  |

In Class 8—"pleasure carriages actuated by electricity designed to carry not less than two persons,"—only one vehicle started up to Wednesday, but several cars were fixed to start in this class on Thursday. The course was to Bell Bar and back, a distance of 31½ miles. Maximum time allowed 3½ hours, minimum 3 hours, including half-hour compulsory stop. Results are appended:—

### CLASS 8.

| Name of Entry.  | Day.       | Time Occupied. | Observer's Report.       |
|---|------------|----------------|--------------------------|
| Mackenzie Carriage Works, London, S.E. (2-seated electric car). | 1st (Wed.) | 3 h. 43 m.     | Everything satisfactory. |

Class 10—"Motor-vehicles of any design, such as a light omnibus, wagonette, carrying a minimum of eight persons including driver." Three vehicles have competed. The

course was to a point  $1\frac{1}{2}$  mile beyond Welwyn and back, a distance of 50 miles:—

## CLASS 10.

| Name of Entry.                            | Day.        | Time Occupied. | Observer's Report.   |
|---|-------------|----------------|--|
| Motor Mfg. Co.<br>(8-seated wagonette)    | 1st (Mon.)  | 5 h. 52 m.     | No incident.   |
|   | 2nd (Tues.) | 5 h. 55 m.     | Everything satisfactory.   |
|   | 3rd (Wed.)  | 6 h. 16 m.     | Do.  |
| Daimler Motor Co.<br>(8-seated wagonette) | 1st (Mon.)  | 7 h. 24 m.     | Car went to Baldock instead of to near Welwyn—72 miles instead of 50 miles.<br>(See Observer's notes.) |
| Do.                                       | 2nd (Tues.) | 6 h. 3 m.      | No incident.   |
| Do.                                       | 3rd (Wed.)  | 6 h. 4 m.      | Do.  |
| Motor Mfg. Co.<br>(chairs-a-banc)         | 1st (Wed.)  | 8 h. 50 m.     | Tire came off 5 minutes after start. Ran short of oil on homeward journey.                             |

As already mentioned, the trials are attracting considerable attention both on the part of motor-car builders and of those interested in automobilism generally, and should do much to prove that motor-cars are not only possible but are practical and efficient vehicles. Full particulars of the remaining tests, as also of the awards, will be given in our next issue. The competing vehicles have, of course, been despatched with a full complement of passengers. No small difficulty was experienced in the early part of the week in obtaining the requisite number of persons to undertake these long trips at practically a moment's notice, but each and every one have come back delighted with their run and anxious to participate in the subsequent days' trials.

## MIDLAND MOTOR NOTES.

By "VERAX."

## The Motor-Car and the School Board Election.

THE car referred to in your last issue was a Benz dog-cart, and was the property of Mr. A. Valintine, of Leamington. He kindly lent it, and drove it for the purpose of bringing voters in from an outlying parish, and who would certainly not have come by other means. The car was lent in the interests of the Church Party, and more especially to canvass for a new vicar, who had only been installed a few weeks previous to the election. The result of motoring so many voters brought the new vicar out at "the head of the poll." Between the hours of 6 p.m. and 8 p.m. the motor made eight visits to the polling booth, the distance to and from the picking-up point being very close on three miles. A horse conveyance was also used, but this only made two journeys in the same time. The voters carried on the motor numbered during that two hours 24, by the horse conveyance for the same time 5! The remarks of some of the astounded voters as they "journeyed to the poll" were very funny. One in particular, who was sitting next to Mr. Valintine, after being asked repeatedly what he thought of motors, at last plucked up his courage and replied, "*Them be a-all right if them be sa-afe.*" However, this gentleman safely recorded his vote, and also returned safely home, much to his gratification. The moral is obvious. If you have a number of people to be conveyed from place to place in a limited time, use a well appointed motor-car.

## Special Motors for Special Districts.

THERE is no doubt that motor-cars would gain public confidence very much quicker if the people who handle them would only consider the elementary laws of nature and mechanics. And this is especially the case when a "motor-car service" is proposed. A car of a certain gear which will run very satisfactorily in fairly flat country will not run at all successfully in a hilly country, and if put to do so will certainly do anything but gain the public

confidence. Now, this is not the fault of the motor at all, but simply of the man responsible for giving it impossible tasks. Let us consider for a moment our locomotives, which undoubtedly are the finest in the world, and what do we find? Firstly, the "fast express" engine with its large driving wheel, or, in other words, "high gear." This class of engine runs at a high speed, and can maintain it when once going as long as the road is fairly easy, but a "stiff bank" of 1 in 30 about four miles long would stop her (of course, there is, metaphorically speaking, only one gear on a locomotive), and once stopped in such a bank she could never start again without the use of a "bank" engine; and it is for this reason that so many various types of locomotives are to be seen, each and all adapted for their various duties. In fact, the "road" has to be carefully considered, and an engine designed to satisfactorily negotiate that "road," whether for express, heavy passenger, or goods traffic. In the same way with a motor-car, the district in which it is to run should first be carefully surveyed, all gradients measured, and the builders of the car should then have these data laid before them, and they can supply for that particular district the car most suited as to gear and power to negotiate it. We have on our railways a locomotive type known as the "mixed locomotive," that is an engine capable of dealing with all classes of traffic, but it cannot be said to be either an express or a heavy goods, and cannot do the work of either of these thoroughly efficiently. And so with the motor: it is impossible to make one to "do everything," so to speak. What is really wanted is a standard type of motor with various gears (petrol motors) interchangeable, so that a car could be supplied with "*gear according to district*," so to speak. The engine supplied with the car should, of course, also be standardized for two to eighteen people—that is, the passenger capacity should be the guide to the engine power, the nature of district the guide to the gears to be used. This is, of course, at the moment an "idealism," and it will be a long time before such a perfect state of things will exist. However, it seems to me that these are the main points engineers should make for, but, of course, the expense of carrying them out in the first instance would be very great, and will, no doubt, be the chief deterrent to progress in this direction. Though at first sight this may seem to some an impracticable scheme, yet a little careful consideration will show that it is not, if carried out right.

## An Amusing Complaint.

THE following extract from a letter of a Midland owner of a Benz car, who of course must be nameless, strikes me as being a decidedly novel way of describing one's experiences in connection with motoring. The gentleman mentioned is an elderly gentleman, and a keen horseman and sportsman generally, and he certainly has a novel way of describing the vagaries of his motor-car. He says, in the course of the letter: "The only conclusion I could arrive at, as regards the car on Monday, was that the devil entered into it, and the devil at about his worst. However, I have since discovered that it was ill-health and not temper. It started *sulky* in the morning, inclined to jib, and not stepping out free at all. I got it along to Welincote, but it went slow and was evidently not fit. Did not go as far up Bishopstree Hill as usual on the high speed. However, it went there. Coming back it laboured in its stride and seemed tired. I tried various expedients, altering the mixture, drawing benzolene, and so on, but by the time I got to the gas works it stopped, evidently clean beat. At last I shoved it to the gas works yard and wired for you. As you did not come I went up to see it in the evening, and found it rested, and managed to get it home. Then I went out with it again; on the way home it stopped again, too tired to go on. Luckily I had my boy with me. We spent a long time investigating its complaints, and finally decided to change the batteries. Then it was quite dead. Then I cussed it as a car generally, and all its component parts

together with the water, benzolene, and grease. I moved the wires carefully to the same point, but it was too dark to see that the fresh cells were put in *l'other way round*. So we shoved the dead corpse home, amidst jeering boys. This morning I did not have it out—then I had an urgent message in the afternoon. Put wires back to the cells, found it worked, and started off again. It did eight miles all right. Then I wired you again, thinking the *brat* had recovered. Then was wired to go immediately to Kineton. Started off again. Again to my intense annoyance it stopped dead beat four miles out. At last I resolved to change the wires again, and off it went in good style, and brought me home well, and now appears to have recovered its health and spirits. In hot weather I do my work in half the time, with half the fatigue." I have in my time seen some curious references to the sometime unreliability, as it is called, of motors, but I think the above absolutely caps every one of them. It is clear that all the trouble was caused by one set of batteries being run down, and the other set not connected up correctly, hence the term "dead corpse," but I think in fairness to the motor that there was clearly nothing very faulty about that. However, as the public knowledge advances in things "motoral," we shall find no mistakes of this class occurring, and by that time the crowds of jeering boys will have their attention diverted from motors, probably to some horse owner who has been fined for overloading his wagon or *chars-a-banc* to compete with that ever-increasing source of annoyance to him in his trade, the motor-car.

#### Motor-Bicycles.

I HAVE seen one or two of these lately simply flying along the Kenilworth Road. They were, I think, of Humber manufacture, and looked very well finished and did not make too much noise, but they seem, except when they are flying full speed, very unwieldy machines, and in damp weather or when the roads are wet I should imagine from what I have seen and heard of their performances that they would be decidedly dangerous, owing to their great tendency to sideslip. In my opinion they are only suitable for "track" work, or road racing if there is no traffic about. At any rate, they are not likely to become popular.

#### MOTOR CYCLING TOURNAMENT AT NEW BRIGHTON.

ON Saturday last an international motor-cycling tournament, under the rules of the London Motor-Car Club, took place at the Tower Athletic Grounds, New Brighton, attracting 3,000 spectators. The races proved most interesting, and very fine performances were done, Beconnais covering five miles with a flying start in the wonderful time of 7 minutes 37 seconds. The proceedings opened with a preliminary promenade of competitors, the following well-known riders taking part:—M.M. Beconnais, De Meestre, and Ricard, all on Phébus-Aster motor-tricycles; M. Geo. Griet riding a Perfecta-Gaillardet; Mr. S. F. Edge on an Ariel; and Messrs. C. Jarrott and N. Brece riding De Dion tricycles.

In the one mile scratch race, open to the world, the first six of the above competed. In the first heat Jarrott was drawn against Beconnais, the latter winning after a capital race. Edge beat De Meestre and Griete beat Ricard. In the final Beconnais finished first and Edge second.

An attack on the one hour British record of 34 miles 700 yards, held by S. F. Edge, was made by Beconnais and Edge. The former covered 37 miles 485 yards, thus doing 2 miles 1,545 yards better than Edge's previous best, the latter doing 35 miles 470 yards.

In the five miles scratch race, Beconnais just managed to beat Jarrott for first place, although Jarrott, during the race, beat the standing mile record, doing the mile in 1 min. 44 secs.

In the attempt on the five miles, Jarrott, after doing one-third of the mile in 31 seconds, unfortunately had a puncture and had to retire. Beconnais afterwards went out and covered five miles with a flying start in 7 min. 37 seconds.

LA SOCIÉTÉ DES AUTOMOBILES (H. de Riancey) is the name of a company which has just been formed in Paris (3 Place Daumesil), with a capital of £1,200, to acquire and exploit the De Riancey & Gevin *avant-train* patents.

## CORRESPONDENCE.

### LADIES AND MOTOR-CARS.

TO THE EDITOR OF *The Motor-Car Journal*.

SIR,—I suppose now the motor-car is well on the market the manufacturers are anticipating a boom in the trade. Will you allow me, Mrs. Suburban Villa, to give the manufacturers a few hints. I have made several visits to the excellent Exhibition at Islington, and, of course, have been converted to the belief that motor-cars will be the vehicles of the future for London suburban residents in particular.

I certainly should have been pleased to have seen more ladies at the show: for I believe the boom in the trade will commence when the ladies take to motor-caring. I fancy I hear some of the men saying, "O, the ladies cannot manage these things"; but don't let the men be mistaken. We manage *them*, and some of them are more difficult to manage than motor-cars. In fact, we intend to take our place in everything, and as motor-car drivers we are most likely to succeed, if our carefulness as drivers of horses is any guide.

What we want to see are good sound mechanics as agents in the suburbs, not tailors, drapers, and fancy shopkeepers, disposing of motor-cars. We do not want the expense of sending to head-quarters for every little nut or bolt or small adjustment that may be required at times. The trade, too, will do well to place as many machines as possible in the suburbs for hire, for the hiring trade gave a fillip to the cycle boom, and that experience should be repeated with regard to motor-cars.

I am now going for a trip on a motor-car, and will give you my opinion next week as to a woman's capabilities of managing the vehicle.

Yours very truly,

MRS. SUBURBAN VILLA.

July 12th, 1899.

### THE PENNINGTON CAR.

TO THE EDITOR OF *The Motor-Car Journal*.

SIR,—I was very pleased to see the communication from Mr. Edge *re* the Pennington car which was published in your last issue. Being in want of a car, and desirous, if possible, of procuring one built on the best system for ordinary and everyday requirements, and at the same time not too expensive, I visited the interesting Exhibition at the Agricultural Hall in order to try and find out which car was the most suitable for my purpose, and I may say that I ultimately decided to have one of the two-cylinder Penningtons, as these appeared to me to possess many practical advantages which I did not discover in any other system.

I am not a novice in motor-car matters myself, as I had the honour of taking the first motor-car from Bournemouth to Southampton, *via* Lyndhurst, through the New Forest, in August, 1896, which, as you know, was before it was legal to do so.

15 Somerset Place,

Boscombe, Bournemouth,

July 12th, 1899.

I am, yours faithfully,

JAMES SHEPHERD.

MORE MOTOR-CARS AT THE SEASIDE.—Licences for three motor-cars to ply at Lowestoft have been granted to Mr. H. C. Adams by the Town Council; and at Worthing a motor-wagonette has been similarly licensed, despite the opposing petition of the local cab-drivers.

DR. COLOHAN, who made a bet that he would drive his motor-car from Blackrock to Galway and back in twelve hours, has accomplished his task. By mutual consent the course was altered from Blackrock to Kilbeggan and back, a distance of about 130 miles. This was covered on a Benz Ideal motor-car with the third speed, and so the worthy doctor won his £200—considerably more than the cost of the car.

## THE DAIMLER CO.'S EMPLOYEES' ANNUAL OUTING.

THE Daimler Motor Company held their third annual wayzgoose on Saturday last, the destination being Stratford-on-Avon. The men started from the works in brakes about eight o'clock in the morning, the staff following later in cars. The ride was much enjoyed and the whole party, including Mr. John Ware, the secretary of the Company, and Mr. A. J. Drake, assistant works manager, reached Stratford well before the time appointed for dinner. A well-served dinner was provided at the "Swan's Nest" Hotel at 1.30, Mr. Ware presiding in the enforced absence of Mr. Critchley. Dinner over, the toasts were led off by Mr. Needham with "The Managers." He expressed on behalf of the employees their regret at the absence of Mr. Critchley, and stated that it accorded them all great pleasure to have Mr. Ware and Mr. Drake amongst them, and hoped that this would be the forerunner of many more pleasant holidays together.

Mr. Drake responded, saying that he thanked the men very much for their kind remarks and wishes towards himself. He, too, was sorry that Mr. Critchley himself was not present and he was sure that Mr. Critchley regretted not being with them. He had, as they all knew, gone over to Paris to see the new things of their foreign friends, and his absence, of course, could not be avoided.

Mr. Goldthorpe, in proposing the toast "Success to the Daimler Company," said it had been his lot to take part in a good many enjoyable days of this kind, and if there were any that deserved to thoroughly enjoy it was a lot of fellows who had worked together all the year round and had come out for their annual outing. The outing had been up to that point a success and he hoped that the whole day's proceedings would go on without a hitch. With regard to foreign competition, the speaker said there was no doubt that others had the advantage in point of time. Foreign firms had started early and therefore they had to a certain extent an advantage, but he had yet to learn that the foreigners could beat us in any industry and he would not believe it until it was perfectly demonstrated; and if the members present would give a long pull, a strong pull and a pull altogether they would make the Company what it had not been up to now—a financial success.

Mr. Ware was glad to see the enthusiasm with which the success to the Daimler Company had been drunk. He informed those present that the desire and the policy of the directors was to gather round them good and true men, and attach them to the Daimler Company by mutual interest. None of those present knew him, but he had had a long experience in business and had made up his mind that there was a splendid future before them if they liked to take it. If they did not, of course they would not get it. What they wanted was unity of policy. The Daimler Company had the lead and they meant to keep it. They had to be first and not be beaten by any of their opponents, and if they were going to get to that point everybody must work. Mr. Ware assured those present that if he could be of any help he would spare no time or effort, and he was sure that Mr. Critchley was the same.

The party had a good run home in the evening and reached Coventry about 10.30 p.m., having spent a most enjoyable day.

## A FURIOUS DRIVING CASE.

EDGAR PASSMORE LONG, of Seamount Road, Westbourne, was summoned for furiously driving a motor-car at Winton, on June 21st. P.S. Gill stated that at 6.30 o'clock on the evening of the day in question he was on duty in plain clothes in the Wimborne Road, Winton, when he saw the defendant driving a motor-car at the rate of seventeen or eighteen miles an hour. He turned suddenly into Alma Road, nearly running down a lady cyclist. When he was about to turn from the Alma Road into the Waterloo Road he narrowly escaped colliding with two male cyclists. Witness and P.C. Sumner, both of whom were in private clothes, went after defendant as quickly as they could and overtook him when he stopped to do some repairs to his machine. He gave his name and address as Edgar Long, of the "Triangle" Hotel. The address turned out to be incorrect, and he also refused to state what his occupation was. The defendant, in defence, said the car was only a 1½-h.p. machine, and it would be impossible to travel at the rate stated. It was only an old-fashioned car, and he neither saw nor heard any lady cyclist. The car made so much noise that it quite drowned the "hooter." The Chairman said the Bench considered it a very serious case, inasmuch as a terrible accident might have happened and the defendant might have been there charged with manslaughter. He had rendered himself liable to a fine of £5, and they felt they must make an example of him. He would be fined £2 and 4s. costs, but if any other cases came before them they would inflict the full penalty.

It is reported that the Paris firemen are so delighted with their new motor-fire-engine that they "take it out on the least provocation."

THE Consolidated Traction Company, Pittsburg, U.S.A., is about to add to its equipment in Pittsburg an automobile emergency wagon for use on its lines. It has been built by the Pope Manufacturing Company.

## MOTOR-CARS ON THE CONTINENT.

## Motor-Car Construction in Sweden.

FROM Stockholm we learn that works are about to be established at Augustendal, near that city, for the construction of motor-vehicles. The works are expected to be in operation early next year.

## The Moscow-St. Petersburg Motor-Tricycle Race.

THE winner of this race, which was referred to in our last issue, was M. Louis Masi, who made the journey in 26 h. 58 m.

## A French Electrical Fire Wagon.

A SUCCESSFUL trial has been made in Paris during the past week with the electric fire wagon constructed in accordance with the designs of Captain Cordier, captain-engineer of the *sapeurs-pompiers*. The vehicle is arranged to carry six firemen, together with the usual fire-extinguishing accessories. It is expected that the new car will be able to reach the scene of a fire in much less time than the horse-drawn vehicles.

## A Record Long-Distance Electrical Run in France.

THE recent run by an electrical vehicle of the Electrical Undertakings, Ltd., from London to Brighton has apparently excited the envy of the French electro-automobilists, for on Sunday, the 2nd inst., Le Compte de Chasseloup-Laubat, on a Jeantaud vehicle, succeeded in making the journey from Paris to Rouen on one charge of the batteries. The distance is 136 kilometres (84 miles), and the time occupied was 7 h. 15 m. Rouen was reached at 11 a.m., and the vehicle immediately taken to a charging station to recharge the batteries. This was done, and the return journey was started at about 8 p.m., Paris being reached 7½ hours later. *La Locomotion Automobile* states that the battery of accumulators carried weighed 900 kilos. (1,980 lb.) Following on this record comes the news that M. Krieger means to endeavour to drive his vehicle from Paris to Dieppe, a distance of 109 miles, on one charge of the accumulators.

## TO CORRESPONDENTS.

All communications intended for insertion in this Journal or relating to Editorial matters should be addressed to THE EDITORIAL DEPARTMENT, MOTOR-CAR JOURNAL, 39 and 40 Shoe Lane, London, E.C. Letters must in all cases be accompanied by the name and address of the writer, as no notice will be taken of anonymous communications.

The Editors cannot undertake to return MSS. or drawings, although every effort will be made to do so in the case of rejected communications. Where such are regarded as of value, correspondents are requested to retain copies.

The Editors do not hold themselves responsible for the opinions expressed by their correspondents, or for statements and facts which do not appear in the editorial columns.

The Editors and Publishers beg also to state that they will accept no responsibility for unsolicited contributions, even if used, unless payment for same is directly specified in forwarding, and the terms arranged before publication.

To insure insertion communications and contributions must be in the Editor's hands by Wednesday forenoon of the week in which the same are intended to appear. Disappointment may be caused by non-compliance with this rule, and to avoid this earlier receipt, if possible, is necessary.

## COMMENTS

### The Close of the Exhibition.

THE Exhibition at the Agricultural Hall, Islington, duly ran its course and closed its doors on Saturday night last. The attendance, which had not been great during the first week, vastly improved during the second, and we believe that if the Exhibition had remained open a fortnight longer really crowded gates would have been the result. The business done during the Show, however, was tremendous, and exhibitors one and all expressed their great gratification, many practically showing their appreciation by booking their spaces for the second Exhibition, which will be held in the same building in April of next year. We may mention that several engineering firms new to the industry have also already booked spaces.

### The "Commercial Efficiency" Trials.

THE "Commercial Efficiency" trials held during the past week have not, alas, turned out as successful as we could have wished, but the result has been to us a saving in the number of gold medals anticipated to be given! When particulars of the trials were first announced we were assured they were too easy, but our answer was that the trials were commercial efficiency ones, and that any vehicle completing the tests was not only commercially possible but extremely satisfactory. Of the cars competing, we were pleased to welcome the advent of the "Princess" (Iden carriage); the "Star" car, which, although failing to obtain a gold medal, did well; the "Hurtu" car (Marshall & Co., Belsize Works, Manchester); and the "Endurance" car, which in five consecutive days did over 400 miles of travelling—surely a test of its efficiency.

### An Unfortunate Accident.

ALTHOUGH the trials were not without their little incidents, nothing of a serious character happened until Friday, when the "Princess" car of the Motor Manufacturing Co. was delayed over two hours owing to an unfortunate occurrence, which, however, it must be stated, was not in any way the fault of the driver of the motor-vehicle. It appears that in driving down-hill near Whetstone the driver of the "Princess" car had to pass a four-horse coach. Just as he was steering to his own side of the road he and the "observer" accompanying him caught sight of an approaching horse-drawn dog-cart, in which were seated a lady and gentleman. When fully 300 yards away from the motor-car the horse suddenly shied, overturning the dog-cart and pinning the unfortunate passengers to the fence. The motor-car was brought to a standstill as quickly as possible, and even then the driver and "observer" of the latter had fully 150 yards to run to get to the prancing horse. After considerable trouble, the horse was got out of the shafts—this being necessary ere the lady and gentleman could be released from their terrible position. A

passing lady placed her carriage at disposal, and the injured persons were conveyed to a neighbouring farm, and afterwards, on the advice of the doctor, to the local hospital. Although the accident is a most regrettable one, from information we have obtained, no blame whatever attaches to the driver of the motor-car, the police, we understand, being satisfied that the speed of the motor-car at the time was not excessive.

### An Incident and Accident.

THE electric-vehicles went through their trials, and several have obtained gold medals. The last of the tests was started on Wednesday with Mr. Cordingley as "observer," the vehicle being an American-built "Riker" with "H. and H." batteries, and owned by Mr. Frost-Smith. The outward journey of fifteen miles was done in 1 h. 24 m., and the return journey seemed likely to be also without incident, until going down the hill by Highgate Station a cyclist suddenly appeared in front of us, wobbled, uncertain whether to go to right or left, and then tried to pass in between our car and another vehicle which we were passing. An accident was inevitable: our brake was jammed hard, the vehicle swerved, caught the kerb, travelled on two wheels for a yard or two, and then the driver and writer were both sent flying over the front of the machine. Quickly picking ourselves up and finding no bones broken, we gazed around, saw the car had turned on its side, one wheel buckled, spokes bent and broken in another; the acid was pouring out in gallons, and the wheels were revolving at great speed. The cyclist was being picked up, having sustained a severe scalp wound, and the sole of one of his shoes was completely stripped off. The accident happened opposite the Winchester Arms, and the landlord did all that a man could do to assist, and performed nobly the work of a "good Samaritan."

### Narrow Wheel Gauge.

WE may mention that before the vehicle started we remarked upon the narrowness of the build of the car, and we also referred in the same way to another American electric car that was on view at the Agricultural Hall. We believe had the car been wider in build it would not have turned over. The injured cyclist was a Mr. Wood, electrician, of Gray's Inn Road, London, W.C.

### Our Trial Track.

THE arena at the Hall was largely taken advantage of, and many machines were purchased as the result of rides round its even and smooth course. The electric vehicles, as usual, shone to perfection, and, according to reports, a number of these "town perfection" cars were sold. The absence of smell and noise in the building was frequently noted, and although the weather was hot outside the magnificent system of ventilation in vogue rendered the Agricultural Hall both sweet and cool day and night.

### The Death of the Czarevitch.

A CONTEMPORARY remarks that it is some relief to find that the death of Czarevitch was not due to a cycle accident, although the excitement of fast riding may have had something to do with it. According to the *Official Messenger*, his Royal Highness, on the morning of his death, went unattended for a ride on a benzine motor-velocipede. Starting from Abbas-Tuman, his Imperial Highness went very fast for two versts, and then turned back. A peasant woman who was passing that way noticed that as the Prince turned the machine round he slackened his pace, and was spitting blood. He then stopped the velocipede altogether and alighted from it, swaying as he did so. The woman ran forward and supported the Czarevitch, asking him, "What is the matter?" His Imperial Highness replied, "Nothing." When the woman offered him some water the Prince made an affirmative gesture, and she bathed his temples and mouth. Death then supervened peacefully and without pain. The remains will be taken to St. Petersburg, reaching the capital on the 25th inst. The funeral will take place on the following day.

### The Parliamentary Motor-Car Record.

At Sir W. D. Pearson's garden party at Paddockhurst last Saturday, M.P.s. were able to indulge in the pleasures of motoring, and probably some Members of the House who then motored for the first time may become enthusiastic devotees of the now fashionable means of locomotion. Meanwhile the Hon. John Scott Montagu holds the Parliamentary record, and his performance on Tuesday should incite Sir Samuel Montagu, Mr. J. H. Dalziel, and other legislator-motorists to greater things than they have hitherto. On Tuesday, Mr. Scott Montagu left his father's, Lord Montagu's place, at Beaulieu, on the skirts of the New Forest, at 5.40 a.m., and reached Clapham at 10.33 a.m., doing the distance of 105 miles in less than five hours, the average pace being twenty-one miles an hour. Legislators may yet be able to live away from town and still attend to their duties at Westminster.

### Motor-Cars and Fashionable Functions.

SIR WEETMAN AND LADY PEARSON on Saturday last entertained a very large gathering of Members of Parliament and other political friends at their beautiful country home at Paddockhurst, Three Bridges, Sussex. The guests were invited to meet the Earl of Kimberley and the Right Hon. Sir Henry Campbell-Bannerman, and nearly 800 ladies and gentlemen accepted the invitation. The guests were conveyed from London by three special trains from Victoria. On their arrival at Three Bridges the party was met by conveyances, in which the four-mile journey to Paddockhurst was made. The vehicles comprised from twenty to thirty four-horse brakes and omnibuses and no less than twelve motor-cars, the latter comprising six coupés and one 'bus from the British Motor Coupé Co., two Daimler wagonettes, two motor-omnibuses of the London Steam Omnibus Co., and the well-known "Lifu" steam wagonette. It is worthy of remark that while the horse-drawn vehicles were taken down by road to Three Bridges on the Friday—necessitating not only a change of horses but also accommodation for two nights for both drivers and horses—the motor-vehicles did not leave London until the morning of Saturday, and returned to town without hitch of any kind the same evening.

### "Dolce far Niente."

LAST year at the close of the Exhibition we arranged a little garden party to Whitton Park, but this year, owing to extreme pressure of work, we were unable to do so, and after being confined within the precincts of the Agricultural Hall for nearly three weeks we were

extremely gratified when Mr. Butler proposed we should visit him on his charming house-boat, "Dolce far Niente," at Bolney Court, near Henley, on the Sunday following the closing day. Mr. Frank Butler, for the moment, is no longer the owner of a motor-car, but we understand he has a Panhard on order, and that it will not be long before delivery is made. Mr. Butler's invitation was conveyed to ourselves and a few friends on the Saturday afternoon about five o'clock, just before he started off on Mr. Whitney's American steam car to Henley. On the Sunday he informed us that he had had an extremely pleasant run down at a good speed and without incident. Mr. House, who was one of the invited, kindly offered his ever-willing "Lifu" wagonette, and personally drove the party, which included Mr. and Mrs. Longhurst, Mr. Hewetson, Mrs. Bazalgette, Mr. and Mrs. Cordingley, and Miss Pursehouse. The meeting was at our

abode in Bloomsbury, and the start was made about half-past eleven. Excepting a stop for water for the vehicle and perhaps lubricants for passengers at Slough, coming and going, there was little or no incident beyond the fact that as we were proceeding through the narrow streets of Maidenhead at a very slow pace, we were twice stopped by policemen putting up their hands. They not saying anything, we proceeded, somewhat disgusted at the unnecessary stoppage. The day was a glorious one, and Mr. Frank Butler exercised that hospitality for which he is so well known, and all his guests had a most pleasant time. We may mention that in the morning Mr. Gretton, of the Motor Manufacturing Company, had been on the house-boat, and in the afternoon Sir Somers Vine, Mr. and Mrs. Roger Wallace, Q.C., and family, and other friends were present.

### An American Consul's View.

IN the course of a report recently sent to Washington by Mr. Rufus Fleming, the U.S. Consul at Edinburgh, he states: "That the motor-cars have a promising future in Scotland, there seems little room for doubt. They can be run into the rural districts in every direction, both for passenger and goods traffic. There are almost as few country roads as city streets on which these vehicles can not safely and easily go. The expansion of the motor-making industry, the changes and improvements in the vehicles, and the development of the street transit motor-lines are now matters of frequent comment. It is announced that the directors of the Glasgow Exposition of 1901 are making extensive provision for an exhibit of these vehicles in the locomotive and transportation department, with facilities for the practical demonstration of their merits."

**The Canterbury-Herne Bay Motor-Vehicle Service.**

WE mentioned in our issue of May 5th last that Messrs. Livet & Underwood, electrical engineers, of Canterbury, had inaugurated a motor-vehicle service between that town and Herne Bay.

So far the service has been successfully carried on by one car—a Daimler—but in consequence of the increase of traffic the organizers are, we learn, this week putting a large new “Lifu” steam wagonette, built by the Liquid Fuel and Engineering Co. of East Cowes, on the service.

**British Motor-Cars at the Paris 1900 Exhibition.**

WE learn that the Committee of the Royal Commission for the Paris Exhibition of 1900 have nominated the Automobile Club as the consulting body to act in co-operation with the Royal Commission in reference to the automobile section of the Paris Exhibition of 1900. The Exhibition is to open on April 15th and to close on November 5th. Automobile vehicles will come under Class 30, Group 6, and will be exhibited at Vincennes. This section of the Exhibition promises to be one of considerable interest, as facilities are to be afforded for showing automobile vehicles in motion. In order to secure that adequate space shall be reserved for the display of the automobiles of British firms, those concerns who are not at present in a position to apply to the Royal Commission for space, for which there will be no charge, should inform the Secretary of the Automobile Club about what square area they are likely to require for their exhibits.

**An Australian Steam-Driven Vehicle.**

DURING the progress of a recent cycle race meeting at Melbourne, Mr. Thomson, of Armadale, exhibited his steam-driven motor-car. The steam is generated by oil-burners, and the car, which takes the form of a “phaeton,” is of striking design, and, judging from the easy manner in which Mr. Thomson put his vehicle through a number of evolutions, he has, states an Australian contemporary, something good in automobilism. The weight of the vehicle is about 1,200 lb., and its ordinary speed is about fifteen miles per hour.

**A Long “Non-Stop” Race.**

ON Thursday last week the Hon. C. S. Rolls, on his Panhard-Levassor two-seated car, left the Exhibition at the Agricultural Hall, Islington, at 11.17 a.m., and after some delay owing to the water-circulation pump, left the foot of Barnet Hill at 12.56 p.m., reaching Baldock (36 miles from Hall) at 2.4 p.m. Returning—without stopping—the Agricultural Hall was reached at 3.53 p.m.; Baldock again at 5.48 and the Agricultural Hall at 7.38. The total time for the two journeys (144 miles) was thus 8 h. 21 m. The car made a continuous “non-stop” run of 134 miles in 6 h. 42 m. On Friday Mr. Rolls again journeyed to Baldock. Leaving the Agricultural Hall at 4.8 p.m., Baldock was reached without incident at 5.46½ p.m., depart 5.47, time of arrival at Agricultural Hall 7.31. The time occupied for the 72-mile run was thus 3 h. 23 m.

**Visit to the French Automobile Club's Exhibition.**

AFTER the close of the Richmond Show, Mr. Frederick R. Sims, Vice-Chairman of the Automobile Club, organized an expedition of members of the Club to Paris to view the French Automobile Club Exhibition. The party included Captain Schenley, Messrs. Worby Beaumont, Frank Butler, Herbert Capel, Thomas Clarkson, Herbert Hankey, Ernest Estcourt, Henry Pearce, Ernest Owers, George Iden and friend, and Mr. Percy W. Northey and Mrs. Northey. The majority of the above-named, together

with Mr. E. M. C. Instone, accepted Mr. Sims' invitation to the luncheon given by him at the villa of the Automobile Club de France in the Bois de Boulogne, which took place on Sunday, July 2nd. Sir David Salomons and the Hon. C. S. Rolls were also on a visit to the French Exhibition at the same time.

**The Start of the Tour de France Race.**

ON Saturday, the 15th inst., the following members of the Automobile Club of Great Britain—viz., Capt. the Hon. Cecil Duncombe, the Hon. C. S. Rolls, Messrs. T. B. Browne, L. H. Walter, A. C. Poole, and the Secretary (Mr. C. Johnson)—left London for Paris to be present at the start of the Tour de France Race, which took place at Champigny at 8 o'clock the following morning—Sunday, July 16th. These members were present at the sealing of the racing carriages outside the French Club on Saturday afternoon; they dined at the villa of the Automobile Club de France on Saturday evening; rose at 4.30 on the Sunday morning, and caught an early train to Champigny, and, having examined the splendid collection of automobile vehicles entered for the race, they walked some distance along the route in order to see the racing cars and racing tricycles—which were started at half-minute intervals—go by at their top speed. As all the racing carriages were of from 10 to 20 h.p., the speed on a straight level road was terrific, and the members of the English Club who were present were delighted with the sight. Some of the party returned to London on the Sunday night and others during the course of the week.

**A Motor-Car Trip across America.**

MR. AND MRS. JOHN D. DAVIS have started on a journey from New York for San Francisco in a Duryea touring cart of heavier construction than usual to stand the wear and tear of country roads. The journey, which will be the longest ever undertaken by motor-carriage, will cover 3,700 miles. The carriage which will be employed is the latest product of the National Motor-Carriage Co., of New York. Its total weight, passengers and luggage included, will be about 1,200 lb.

**The Electrical Cab Company.**

IT is with great regret we learn that the Electrical Cab Company has been compelled to pay off all its men and close its yard yesterday, in consequence of the difficulty in finding drivers, and the exhaustion of its capital. Recently only about a dozen out of the eighty of the Company's cabs have been at work, the “season” rendering the obtaining of skilled men very difficult. All the directors have resigned, with the exception of Mr. Walter Bersey, the chairman and managing director. The Company, we are informed, will be reconstructed.

**The Cycle Trade and Motor-Cars.**

A SIGNIFICANT feature of the Motor-Car Exhibition at the Agricultural Hall was the large number of cycle trade visitors. Indeed, we heard it stated that except for the exhibits one could almost imagine they were at the Stanley Cycle Show, so many familiar faces in the cycle trade being visible. The exhibitors, too, numbered quite a number of firms intimately connected with the cycle industry, including Messrs. Brampton Bros., Ltd., Messrs. Brown Bros., Ltd., the Allard Cycle Co., Ltd., the Star Cycle Co., Ltd., Messrs. Friswell & Co., and the Dunlop Co. It is an open secret that quite a number of cycle manufacturing concerns in the Midlands are quietly working on experimental motor-vehicles, while in the London district there are many small firms which are preparing to add the sale and repair of motor-cars and cycles to their business.

## LE TOUR DE FRANCE.

## THE START FOR THE GREAT FRENCH CONTEST.

(From Our Own Correspondent.)

PARIS, July 18th.

WHAT racing has done in England for horses and cycles it is now doing for automobiles in France, and all those English autocarists who were fortunate enough to witness at Champigny last Sunday morning the start for "Le Tour de France" must have been filled with regret that racing is not permitted in England, for undoubtedly an occasional *course* would do more

FIGS. 1 AND 2.—TWO VIEWS TAKEN AT STARTING POINT.

than anything else to further the British industry and to render popular the grand sport of automobilism.

In France to this cause must be largely attributed the present excellency of autocars, both as regards design and material and workmanship, for the numerous races are productive of the keenest competition among the many French manufacturers, each firm continuously striving to build cars faster and more durable than those of their rivals, well knowing that in the event of success the number of orders resulting will repay a hundred times over their initial outlay of time and money. "Le Tour de France" has been promoted and organized by *Le Matin*, under the auspices of the Automobile Club de France, and it is by far the severest test to which racing automobiles have yet been put. The race is being run off in seven stages, the distances per day ranging from a minimum of 192 kilometres on the last day to a maximum of 441 kilometres on the second, the total distance being 2,229 kilometres. The stages are as follows:—

|                                     |      |     |
|-------------------------------------|------|-----|
| July 16—Paris to Nancy .. .. .      | Kil. | 290 |
| " 17—Nancy to Aix-les-Bains .. .. . |      | 441 |
| " 19—Aix-les-Bains to Vichy .. .. . |      | 382 |
| " 21—Vichy to Périgueux .. .. .     |      | 299 |

|                                     |      |     |
|-------------------------------------|------|-----|
| July 22—Périgueux to Nantes .. .. . | Kil. | 339 |
| " 23—Nantes to Cabourg .. .. .      |      | 348 |
| " 24—Cabourg to Paris .. .. .       |      | 192 |

The competing automobiles are divided into three classes—carriages, motor-cycles, and voiturettes; and in each category valuable prizes are offered, amounting to a gross aggregate of £900. The entries were 32 carriages, 31 cycles, and 4 voiturettes, and of these 19 carriages, 25 cycles, and all the voiturettes started from Champigny on Sunday morning. They were:—

| CARRIAGES. |                            |                       |  |  |      |

| 67.—         | Gabriel .. ..  | " .. ..     |  |  |  |

The start was made from the hill at Champigny, on the Ozouer road, at 8 o'clock in the morning, but long before that hour an enormous crowd had assembled, while a constant stream of cyclists and automobilists passed through the *contrôle* en route for various points of vantage from which to view the vehicles travelling at full speed. The majority of those on foot, however, preferred to see the race at its initial stage, as the weather was far too hot to permit of much exertion, and accordingly, after an inspection of each car, we took our station at a point some 300 yards from the summit of the hill, and from there witnessed the passing of the competitors as they were despatched from the *contrôle* at intervals of thirty seconds. At this spot the fastest travelling car was undoubtedly the Amédée Bollée of M. Avis, and it was truly astounding to observe the rapidity with which this vehicle in particular got into its stride. This car, in common with the two other high-powered Amédée Bollées which are competing, carries a funnel-shaped sail to conduct a constant current of air directly on to the radiators, which are placed high up on

the back of the car—a truly ingenious arrangement. These three cars have also a distinctive feature in the absence of a front axle, massive springs taking its place. Of the competing Panhard cars little need be said, as voluminous descriptions of the king of motor-vehicles have appeared so frequently

FIGS. 3 AND 4.—TWO SNAP-SHOTS OF VEHICLES EN ROUTE.

during recent months; but it is interesting to note that M. René de Knyff's 12-h.p. racer, of the last Paris-Bordeaux course, is now participating in the tour under the guidance of M. Pinson, while M. de Knyff himself is, of course, driving his new 16-h.p. vehicle. The Mors new racers are beautiful examples of workmanship and finish, and are modelled

FIG. 5.—M. R. DE KNYFF'S PANHARD CAR.

on very similar lines to the Panhard cars; indeed, at a little distance the two makes appear almost identical. These Mors cars have the motor in front in a case similar to that on a Panhard; they have sloping wheel steering and cog wheel transmission gear, while their speed levers are much in the

same position as those on the cars from Ivry. The competing Bolide car holds the kilometre record for petrol vehicles, but it remains to be seen whether it is a "stayer." Certainly, the most extraordinary vehicle in appearance is that belonging to M. Flash (the racing name of a well-known autocarist), which *Le Matin* describes as being like a slipper very high in the instep. And this truly represents the aspect of this car, which is provided with a 16-h.p. four-cylinder Vallée motor, and utilises belts for the transmission of power. After the cars, the cycles and voiturettes passed in quick succession, leaving us at the finish absolutely smothered in dust and overcome with the intense heat, but comforted by the reflection that our route to the station was downhill throughout. And so, among a dense throng of men and motors, we wended our way homewards, well satisfied at having participated at the start of what will doubtless be recorded as a historic race. I send you several photos taken at the starting place, and also at a point where the vehicles had commenced to get up speed.

THE Lowestoft Motor-Car Co., Ltd., has been registered with a capital of £3,000 to manufacture, sell, let on hire, and deal with motor-cars, and to carry on the business of carriers, engineers, etc. The registered office is at 26 Nelson Street, Lowestoft.

Six additional motor-cars arrived in Newcastle last Tuesday afternoon from the south. They attracted a good deal of attention on arrival at the Central Railway Station. The cars have been put on the streets for hire during the week.

MR. A. H. DOWNES, of 28 and 29 St. Swithin's Lane, the liquidator of the Australian Cycle and Motor Company, requests creditors to send particulars of their claims to him by Thursday, the 31st prox. For Australian creditors the date is Saturday, October 21st.

THE Epstein Electric Accumulator Syndicate, Ltd., has been registered with a capital of £10,000 to adopt an agreement with Mr. Roger W. Wallace for the acquisition of certain patents and property; to manufacture and deal in secondary batteries, and to carry on the business of an electric light and power company, etc.

AT the quarterly meeting of the Warwickshire County Council at Warwick the other day a letter was read from Ryton-on-Dunsmore Parish Council complaining of the rate at which motor-cars passed through the village, endangering the lives of the school children. It was referred to the Roads and Bridges Committee, and the Chief Constable's attention was called to the complaint.

THE general passenger agent of the New York Central and Hudson River Railroad has determined to establish an electric cab and carriage service at the Grand Central Station in New York. A charging station and a general repair shop for the electric vehicles will be built in the station. The cabs are to be owned and operated by the railroad company. One hundred will, it is stated, probably be installed as soon as the station is completed.

AT a special meeting of the Maidenhead Town Council on Monday evening, a petition was presented calling attention to the negligence of motor-car drivers passing through the town, and asking the council to take steps to reduce the danger caused by such traffic to a minimum. The Mayor announced, as a remarkable and pathetic coincidence, that the petition was sent to him with a letter by the late Miss Bulkeley, who on the very next day met with a fatal accident through her horse becoming frightened by a motor-car. The council resolved to petition the Local Government Board in favour of the registration of motor-cars and to erect boards cautioning cyclists and motor-car drivers as to speed in passing through the town.

## THE MOTOR-CAR JOURNAL'S "COMMERCIAL EFFICIENCY" TRIALS.

IN our last issue we dealt with the details of these trials up to Wednesday evening. The tests were, however, not brought to a conclusion until late on Saturday evening, so that we now complete our account of the same.

The trials were divided into fifteen different classes, so as to include every type and size of motor-vehicle; and so great has been the interest taken in the trials that entries in nine different classes were received. A start with the tests was made on Monday, the 10th inst., when vehicles in three classes were started, altogether six vehicles leaving the hall; on Tuesday ten vehicles participated; on Wednesday fifteen cars of different types were out on trial; on Thursday no less than twenty-one; on Friday, twelve; and on Saturday, nine. In Class 1—"parcel vans propelled by petroleum-spirit motors and designed to carry a minimum load of 15 cwt. and two persons"—two vehicles competed. The route was to Welwyn and back, fifty miles, the minimum time allowed being 6 hours, the maximum 6½ hours, with a compulsory one hour stop at end of outward journey. The results are as follows:—

| Name of Entry.                  | Day.         | Time occupied between leaving Hall and return. | Observer's Report.  |
|---------------------------------|--------------|--|---|
| Motor Mfg. Co., Ltd., Coventry. | 1st (Tues.)  | 7 h. 1 m.                                      | Slow up hill, even on first speed. Stopped on return journey 5 min. to replenish petrol tank. |
| Do.                             | 2nd (Wed.)   | 6 h. 21 m.                                     | No incident.  |
| Do.                             | 3rd (Thurs.) | 6 h. 33 m.                                     | 12 min. delay owing to steering-gear; otherwise everything satisfactory.                      |
| Daimler Motor Co.               | 1st (Wed.)   | 6 h. 19 m.                                     | No incident.  |
| Do.                             | 2nd (Thurs.) | 6 h.   | do.   |
| Do.                             | 3rd (Fri.)   | 6 h. 1 m.                                      | do.   |

Class 6, which is devoted to "pleasure carriages designed to carry not more than two persons, actuated by steam or petroleum-spirit motors, and carrying a full load during the trials," brought the largest number of entries, no less than eleven vehicles competing. The route in this case was from the Agricultural Hall to Baldock, *via* Hatfield, and back, a total distance of seventy-two miles. A compulsory stop of one hour at Baldock was required, and no car had to take less than 7 hours or more than 7½ hours for the journey. The times of the competing cars in this class are shown below:—

### CLASS 6.

| Name of Entry.                                       | Day.        | Time Occupied.          | Observer's Report.   |
|--|-------------|-------------------------|--|
| Star Cycle Co., Ltd., Wolverhampton (No. 1 car).     | 1st (Mon.)  | 8 h. 48 m.              | Frequent stoppages, both on outward and return journey, owing to motor over-heating.   |
| Do.  | 2nd (Tues.) | 7 h. 48 m.              | Stopped once each outward and return journey for water.  |
| Do.  | 3rd (Wed.)  | 7 h. 25 m.              | Ditto.   |
| Star Cycle Co., Ltd. (No. 2 car).                    | 1st (Mon.)  | (See Observer's Notes.) | Exhaust pipe required attention outward journey, 17 min. delay. Return journey a tire burst at Finchley, where car had to be left.   |
| Do.  | 2nd (Tues.) | 7 h. 48 m.              | Stopped once on journey each way for water.  |
| Do.  | 3rd (Wed.)  | 8 h. 19 m.              | Outward journey no incident. Return journey, accumulators gave out at Finchley.  |
| Daimler Motor Co., Coventry (Critchley 5½-h.p. car). | 1st (Tues.) | 8 h. 33 m.              | 85 min. delay outward journey owing to belt-joint breaking, tire burst, and extinguishing of lamps. Return journey, 25 min. delay owing to belt-joint breaking, and water-pipe leak. |

| Name of Entry.                                       | Day.         | Time Occupied. | Observer's Report.  |
|--|--------------|----------------|---|
| Daimler Motor Co., Coventry (Critchley 5½-h.p. car). | 2nd (Wed.)   | Did not start. |   |
| Do.  | 3rd (Thurs.) | do.            |   |
| Daimler Motor Co. (Critchley 3½-h.p. car).           | 1st (Wed.)   | 7 h. 36 m.     | Several stops owing to trouble with water circulation pump.   |
| Do.  | 2nd (Thurs.) | —              | Tire burst at Potter's Bar outward journey. Car did not complete journey.   |
| Do.  | 3rd (Fri.)   | Did not start. |   |
| Marshall & Co., Manchester (Hurtu car).              | 1st (Tues.)  | 7 h. 14 m.     | No incident.  |
| Do.  | 2nd (Wed.)   | 6 h. 49 m.     | Stopped once on outward journey to oil up and for water. Return journey, one stop for water.  |
| Do.  | 3rd (Thurs.) | 7 h. 8 m.      | No incident outward journey; return journey, switch gave slight trouble, also a lubricator failed to work properly, causing heating of crank. |
| London Autocar Co. (Hurtu car).                      | 1st (Wed.)   | —              | Tire burst outward journey; car left at Baldock.  |
| Do.  | 2nd (Thurs.) | Did not start. |   |
| Do.  | 3rd (Friday) | do.            |   |
| Motor Mfg. Co. (Bollée voiturette).                  | 1st (Thurs.) | 7 h. 2 m.      | Lamp went out once; otherwise no incident.  |
| Do.  | 2nd (Friday) | 6 h. 57 m.     | Everything satisfactory.  |
| Do.  | 3rd (Sat.)   | 7 h. 22 m.     | do.   |
| Motor Mfg. Co. ("Princess" car).                     | 1st (Thurs.) | 7 h. 1 m.      | Every satisfactory.   |
| Do.  | 2nd (Friday) | 8 h. 26 m.     | Owing to accident to a horse-drawn dog-cart through horse shying two hours unavoidable delay occurred.  |
| Do.  | 3rd (Sat.)   | —              | Tire burst near Stevenage; outward journey, car did not complete journey.   |
| Automobile Asso., Ltd. (Lynx car).                   | 1st (Thurs.) | 8 h. 8 m.      | Outward journey, two stops for motor (20 m. delay.) Return journey, inner tube of tire burst; new one inserted. Except for this car ran well. |
| Do.  | 2nd (Friday) | 7 h. 33 m.     | 32 m. delay, owing to belt troubles.  |
| Do.  | 3rd (Sat.)   | 6 h. 38 m.     | Everything satisfactory.  |
| J. Burns, 44 Berners Street, W. (Endurance car).     | 1st (Thurs.) | 7 h. 56 m.     | Outward journey no incident. Return journey belt broke twice and a cable connected with commutator broke, causing total delay of 1 h. 6 m.    |
| Do.  | 2nd (Fri.)   | 6 h. 50 m.     | Water box fell down outward journey (30 m. delay); otherwise everything satisfactory.   |
| Do.  | 3rd (Sat.)   | 6 h. 59 m.     | Everything satisfactory.  |
| Automobile Association (Orient Express car).         | 1st (Thurs.) | 8 h. 34 m.     | do.   |
| Do.  | 2nd (Fri.)   | Did not start. |   |
| Do.  | 3rd (Sat.)   | do.            |   |

In Class 7—"pleasure carriages designed to carry not less than four persons, actuated by steam or spirit-motors, and carrying a full load"—there were six competitors. The route was the same as in Class 6. Appended are the results:—

### CLASS 7.

| Name of Entry.                      | Day.         | Time occupied. | Observer's Report.   |
|-------------------------------------|--------------|----------------|--|
| Motor Mfg. Co. (4-seated dog-cart). | 1st (Tues.)  | 9 h. 38 m.     | Vehicle slow all outward journey, especially up hills; three stops, 5 m. for burners, and two stops for steering gear. |
| Do.                                 | 2nd (Wed.)   | 7 h. 16 m.     | Everything satisfactory.   |
| Do.                                 | 3rd (Thurs.) | 6 h. 50 m.     | Outward journey cap came off axle (2 min. delay); otherwise no incidents.  |

| Name of Entry.   | Day.         | Time Occupied. | Observer's Report.  |
|--|--------------|----------------|---|
| Motor Mfg. Co. (Iveagh phaeton).                           | 1st (Mon.)   | 6 h. 59 m...   | No stop, no incident.   |
| Do.  | 2nd (Tues.)  | 7 h. 9 m...    | Stopped three times—<br>10 m. steering gear,<br>2 m. carburettor, and<br>4 m. ignition tubes.   |
| Do.  | 3rd (Wed.)   | 7 h. 0 m...    | Everything satisfactory.  |
| Daimler Motor Co. (Knightley Victoria).                    | 1st (Mon.)   | 6 h. 52 m...   | No incident.  |
| Do.  | 2nd (Tues.)  | 7 h. 3 m...    | do.   |
| Do.  | 3rd (Wed.)   | 6 h. 55 m...   | do.   |
| The Automobile Association, Nottingham Hill (Cambier car). | 1st (Wed.)   | —              | Car only got as far as Liverpool Road, Holloway, when in turning corner sharply vehicle skidded, dragging off a tire, and slightly damaging a wheel. Car returned to Hall without completing journey. |
| Do.  | 2nd (Thurs.) | Did not start. |   |
| Do.  | 3rd (Fri.)   | do.            |   |
| Automobile Association (Cambier Wagonette).                | 1st (Thurs.) | —              | Several stops owing to tire punctures, breakage of petrol supply pipe, and leak in water-tank. Car did not return to Hall same day.   |
| Do.  | 2nd (Fri.)   | Did not start. |   |
| Do.  | 3rd (Sat.)   | do.            |   |
| Motor Mfg. Co. (Irish Dog Cart).                           | 1st (Thurs.) | 6 h. 58 m...   | Two stops owing to burners going out; otherwise no incident.  |
| Do.  | 2nd (Fri.)   | 7 h. 1 m...    | Everything satisfactory.  |
| Do.  | 3rd (Sat.)   | 7 h. 17 m...   | Six minutes delay owing to steering gear, outward journey; otherwise everything satisfactory.   |

For Class 8—"pleasure carriages propelled by electricity, designed to carry not less than two persons and carrying a full load during the trials,"—the course was to Bell Bar and back, a distance of  $3\frac{1}{2}$  miles. The two-seated trap of the Electrical Undertakings, Ltd., did the journey on three consecutive days in respectively 3 h. 56 m., 3 h. 52 m., and 3 h. 37 m. These times including half-an-hour's compulsory stop at the end of the outward journey. The two-seated car of Mackenzie's Carriage Works, London, S.E., was also very successful over the same route. The vehicle was driven by Mr. Mackenzie, jun., his times for the three days being 3 h. 43 m., 3 h. 43 m., and 3 h. 44 m.

In Class 9, Mr. Frost-Smith entered and drove a Riker four-seated car, fitted with a special set of accumulators known as the "H. and H." In this class the course was to Potter's Bar and back, a distance of twenty-five miles. Mr. Frost-Smith's time for the three runs, including a compulsory stop of half an hour at the end of the outward journey, was 3 h. 3 m., 3 h. 8 m., and 2 h. 59 m.

Class 10—"Motor-vehicles of any design, such as a light omnibus, wagonette, carrying a minimum of eight persons including driver." Three vehicles have competed. The course was to a point  $1\frac{1}{2}$  mile beyond Welwyn and back, a distance of 50 miles:—

#### CLASS 10.

| Name of Entry.                         | Day.        | Time Occupied. | Observer's Report.   |
|--|-------------|----------------|--|
| Motor Mfg. Co. (8-seated wagonette).   | 1st (Mon.)  | 5 h. 52 m...   | No incident.   |
| Do.                                    | 2nd (Tues.) | 5 h. 55 m...   | Everything satisfactory.   |
| Do.                                    | 3rd (Wed.)  | 6 h. 16 m...   | do.  |
| Daimler Motor Co. (8-seated wagonette) | 1st (Mon.)  | 7 h. 24 m...   | Car went to Baldock instead of to near Welwyn—72 miles instead of 50 miles.<br>(See Observer's notes.) |
| Do.                                    | 2nd (Tues.) | 6 h. 3 m...    | No incident.   |
| Do.                                    | 3rd (Wed.)  | 6 h. 4 m...    | do.  |
| Motor Mfg. Co. (chars-a-banc)          | 1st (Wed.)  | 8 h. 50 m...   | Tire came off 5 minutes after start. Ran short of oil on homeward journey.                             |

| Name of Entry.                | Day.         | Time Occupied. | Observer's Report.  |
|-------------------------------|--------------|----------------|---|
| Motor Mfg. Co. (chars-a-banc) | 2nd (Thurs.) | —              | Several stops outward journey, owing to motor steering gear and burners. Car only proceeded as far as Potter's Bar, and returned without making full journey. |
| Do.                           | 3rd (Fri.)   | Did not start. |   |

Class 14—"carrier motor-tricycles or voiturettes, carrying a load of not less than 200 lb. in addition to driver, and having not more than 3-h.p. motor or engine"—only brought forward one competitor. The route was to just beyond Welwyn and back, 50 miles:—

#### CLASS 14.

| Name of Entry.                   | Day.         | Time occupied. | Observer's Report.   |
|----------------------------------|--------------|----------------|--|
| Motor Mfg. Co. (Bollée carrier). | 1st (Thurs.) | —              | Vehicle did not complete journey, being left at Welwyn, owing to trouble with motor. |
| Do.                              | 2nd (Fri.)   | Did not start. |  |
| Do.                              | 3rd (Sat.)   | do.            |  |

As already mentioned, the trials attracted considerable attention both on the part of motor-car builders and of those interested in automobilism generally, and should do much to prove that motor-cars are not only possible but are practical and efficient vehicles.

### THE AWARDS.

The following are the awards:—

#### CLASS 1.

Gold Medal—Van, Daimler Motor Co. (Letzer, Driver.)  
Certificate—Van, Motor Manufacturing Co. (Hawkins, Driver.)

#### CLASS 6.

Gold Medal—"Hurtu" car, Marshall & Co. (Tatton, Driver.)  
Do. Bollée, Motor Manufacturing Co. (Gollidge, Driver.)

Silver Medal—"Lynx" car, Automobile Association.

Do. "Endurance" car, J. Burns. (E. D. Billings, Driver.)

Certificate—"Star" car, Star Cycle Co. (J. Lisle, Driver.)

Do. "Princess" car, Motor Manufacturing Co. (Hallams, Driver.)

#### CLASS 7.

Gold Medal—Irish dog-cart, Motor Manufacturing Co. (Andrews, Driver.)

Do. Iveagh Phaeton, Motor Manufacturing Co. (Andrews, Driver.)

Do. Knightley Victoria, Daimler Motor Co. (O. Mayer, Driver.)

Certificate—4-seated dog-cart, Motor Manufacturing Co. (Glasgow, Driver.)

#### CLASS 8.

Gold Medal—2-seated trap, Electrical Undertakings, Ltd. (Kuettner, Driver.)

Gold Medal—2-seated car, Mackenzie's Carriage Works. (Mr. Mackenzie, jun., Driver.)

#### CLASS 9.

Gold Medal—Riker car, with "H. and H." batteries, Mr. Frost-Smith. (Mr. Frost-Smith, Driver.)

#### CLASS 10.

Gold Medal—8-seated wagonette, Daimler Motor Co. (Gadsden, Driver.)

Gold Medal—8-seated wagonette, Motor Manufacturing Co. (Haxton, Driver.)

## THE "PROGRESS" MOTOR-CAR.

AS will be seen by the illustrations herewith, this is a small car for two people, and should meet with a very popular demand. The engine, which will be seen in Fig. 1, is of  $2\frac{1}{2}$  h.p., and inclined slightly forward. Cooling is effected by means of very large cooling ribs, which are certainly very effective, although it has been argued that the De Dion engine of  $1\frac{1}{2}$  h.p. is the largest engine which will run satisfactorily without water-cooling. It must be taken into consideration, however, that the speed of this engine when giving off its power is only about half the speed of the De Dion engine, and there are consequently only half the number of explosions, and a proportionately greater cooling area. The ignition is electric, there being a switch on the secondary engine shaft for cutting the primary current on and off from the induction coil, which is complete with its own vibrator. This system seems to give even better results in practice than the De Dion system. The weight of the car complete is only  $4\frac{1}{2}$  cwt., so that there is no need to have reversing gear fitted to comply with the regulations regarding motor-cars laid down by Act of Parliament. The transmission gear is of a novel design and principle. Two 1-in. pitch chains are geared direct to the motor, and drive two wheels of different size on the counter-shaft, which, when the car is standing or out of gear, revolve freely around the counter-shaft. These wheels are mounted on ball bearings; in fact, ball bearings are employed throughout the car. In order to bring either of these wheels into gear it is only necessary to move the one starting handle either to the right or left for the low or high speed as may be required. This action causes one of the wheels to revolve with the counter-shaft, and of course at the same speed by means of two levers, which, being moved laterally along the shaft, are pressed further apart by means of a cone on the shaft, causing a band brake to grip around a band drum, part of the gear wheels, and thus to cause the gear wheel to be rigidly connected to the counter-shaft and to revolve with it. The motion of the counter-shaft is again transmitted to the rear road wheels by another 1 in. pitch chain placed centrally, and carried on the usual differential gear. Steering is effected by means of a wheel, which will be seen from Fig. 2 to be slightly inclined to the driver, giving the car a very pretty appearance, and also being very handy and easy of access. In the vehicle illustrated the engine

FIG. 1.—REAR VIEW OF "PROGRESS" MOTOR-CAR.

is not placed centrally, but will be in later types. The carburettor is of the Longuemare type, which is by this time well known to our readers. The seat is well sprung, as will be seen, and is comfortable. Another novel idea in the construction is the use of fibre instead of woodwork for the flooring, etc., of the car. This, although less than a  $\frac{1}{4}$  in.

thick, is very strong and cannot be split or broken, and is also possessed of considerable strength, being, of course, light into the bargain. The only handles used in controlling the car are the speed handle (which by the way will not allow of both gears being put in at once), the steering wheel, and the throttle valve and advance sparking levers, which will all be carried on the steering pillar, and therefore very easy of

FIG. 2.—SIDE VIEW OF "PROGRESS" MOTOR CAR.

access. Another good point is that in applying the gear, which is positive in action, there is no sudden application causing a jolting start of the car and consequent discomfort, but as the speed lever is pushed over the tension on the band-brakes is gradually increased, and the car starts smoothly and noiselessly away. The engine is started by means of a handle at the driver's side, which is put in or out of gear with the starting pinion by revolving the eccentric bearing on which its axle revolves. The wheels, as will be seen, are tangentially spoked, and have large Dunlop pneumatic tires. The framework is entirely of tubular construction, well braced and very strong. The makers, the Progress Cycle Co., Ltd., of Coventry, have certainly struck a happy design, and have turned out a very neat and handy little car which does them every credit.

### Proposed Flying Visit to View Portion of the "Tour de France" Race.

THE Secretary of the Automobile Club points out that British automobilists who desire to see a portion of the remarkable "Tour de France" automobile race may do so by taking a "week-end" return first-class ticket from Waterloo to Havre (24s.), and by leaving Waterloo at 9.45 on Saturday night they should arrive at Havre on Sunday morning in time to proceed by boat at 7.45 for Trouville, and there catch a train at 9.1 for Cabourg, arriving there at 10.5 a.m. As there are no Sunday boats from Havre to Southampton the return by this service would have to be delayed until Monday night. The start of the last day's race from Cabourg to Paris could thus be seen on Monday morning. But since the majority of automobilists will wish to be at the dinner at the "Star and Garter," Richmond, on Monday night, which is to be given in honour of the Baron de Zuylen, the return to London can be made by leaving Cabourg at 4.31 and catching the 6.45 boat at Trouville for Havre, there taking the 8.20 train for Rouen, thus catching the night service *via* Dieppe for London. The "Tour de France" race on Sunday is from Nantes *via* Caen to Cabourg, 348 kilometres (216½ miles). The start from Nantes is at 7 a.m.; the arrival at Cabourg, therefore, should be about 1 o'clock.

## THE BAYLEY STEAM TIP-WAGON.

THE accompanying illustration shows the steam tip-wagon displayed at the recent motor-car exhibition at the Agricultural Hall by Messrs. Bayley's, Limited, of Newington Causeway, London, S.E. This vehicle is a combination of excellent parts, comprising a De Dion water-tube boiler, a Straker motor, and a transmission mechanism very similar to that employed on the Daimler petroleum-spirit cars. The vehicle is stated to weigh, unladen, 58 cwt., and to be designed to carry a load of four tons. The De Dion boiler, which is coke-fired, is located in the fore part of the vehicle. The engine, which is of the vertical compound type, is arranged under the driver's seat; it is stated to indicate 20 h.p., the normal speed being 500 revolutions per

minute. The shaft of the motor extends from the front right to the rear of the car, where the power is transmitted through bevel gearing to an intermediary shaft. The latter carries at its ends small pinions, which gear with internally-toothed rings bolted to the rear road wheels. A variable speed gear is provided, and it is stated that the wagon can attain any desired speed from two to seven miles per hour. The road wheels are strongly built and dished. Ample brake power is provided, there being a shoe brake acting on a drum on the motor shaft, and band brakes on each of the internally-toothed rings connected to the rear road wheels. The result of a twenty-mile test of this wagon was given in our issue of June 30th last.

PROGRESS is being made with the formation of the Automobile Club of America.

CONSIDERABLE interest has been evinced at the several motor-cars exhibited at the Bagshot Fair this week.

THE Mississippi Valley Automobile Transportation Co., of East St. Louis, Illinois, has just been incorporated to manufacture and operate motor-vehicles. The capital is £100,000.

MEMBERS of the Automobile Club are reminded of the dinner of the Club in honour of the President of the French Club, which is to take place at the "Star and Garter" Hotel, Richmond, on Monday next, the 24th instant, at 7.30.

MR. J. HECTOR GRAHAM, of the Graham Equipment Co., 170 Summer Street, Boston, U.S.A., is in Europe investigating the conditions and prospects of the motor-vehicle industry. Doubtless he will be at Liverpool at the end of the present month, as his Company has entered a vehicle in the heavy-traffic motor-vehicle contest to take place there, as announced in these columns last week.

## MIDLAND MOTOR NOTES.

By "VERAX."

### The Humber Motor-Tandem Quadricycle.

I HAD, thanks to the courtesy of Mr. Philipps, the manager of the Humber Co.'s Works at Coventry, the opportunity of inspecting the gigantic works in which the noted bicycles of the Humber Co. are made, and now a large number of small motors. I had a short spin on perhaps the most successful motor they have turned out, which is described in my heading. This quad. far surpasses anything of a similar nature that I have tried before, and the suspension of the front seat is so perfect that there is practically no vibration at all at any speed, and this also applies to the handle-bar. The ignition is electric, the current being provided from dry batteries, which, as is now well known, give no trouble whatsoever, and have a long life compared to the accumulative system of storing. The engine at present fitted is the 1½-h.p. De Dion of latest type, which needs no description. For those who require even more speed I understand a 2½-h.p. De Dion engine is fitted. The gear on the single-gear machines is "medium," and with it the engine is capable of taking two persons up a fairly stiff gradient unassisted; but for very hilly country a two-speed gear is fitted. With this gear the machine is a most serviceable one, and requires very little "human assistance" at all. The steering is differential and is somewhat on the lines of the Marriott & Cooper Olympia tandem. The driver sits on a cycle or "pan" saddle, and a foot-board is provided for his feet, ensuring greater comfort than that afforded by the awkward and uncomfortable position by using the "free" pedals for this purpose. The front seat is supported on cradle springs, giving great elasticity and comfort consequently, and it is situated fairly low down, the cushion top being level with the hindguard which covers the 28-in. wheels. This is done to allow the driver an unobstructed view of the road he is negotiating, which is, of course, very necessary, and does not cause that side-ache which drivers of the old fashioned Bollée have had to put up with owing to the two seats being nearly on a level. All the controlling handles are placed on the top or compression tube of the machine, and are very easy of access. The brake, by a very neat arrangement, may be applied by either foot or hand lever, or both in case of emergency. The current to the motor is controlled by the usual switch on the left handle. An extra oil tank, same shape as the seat, and placed under it is not noticeable to the casual observer, but carries, nevertheless, a supply of oil sufficient for a fifty-mile run. The carburettor, of the usual surface type, not only acts as a vaporiser but also as an oil reservoir, and this carries enough spirit for a fifty-mile journey. A neat tool box is also arranged under the front foot-board. Very efficient mud-guards are fitted, which prevent annoyance from dust and dirt to the passengers. The gearing is quite encased in a metal bath, which, filled with grease and oil, keeps the wheels well lubricated and prevents undue noise. Altogether the machine has a very handsome appearance, and with its 1½-h.p. engine is certainly a stayer. The demand, I understand, is increasing largely for these quads, and the Company at present can turn out five a week. One was going away to Germany the day I was at the works, and was finished in high-class style.

### Other Motors at the "Humber" Co.'s Works.

OF course, this is not the only type of machine made, as the Company have long been experimenting with motors and have produced some certainly curious-looking machines. I noticed the Lawson bicycle and Victoria with the main engine axle running through the hub of the wheel it drives by means of a Crypto gear. This

certainly is a very compact method of working, and ensures at all times sufficient weight on the driver. As this wheel is also the steering wheel in carriages and bicycles, it, of course, renders turning very easy, and the carriage may be turned round in the street in its own length, which is a very important point. There was also the Humber carriage, somewhat similar in general appearance to the Hurtu, but with the engine situated horizontally in front. This car has been the subject of a considerable amount of experiment, but I understand is now a satisfactory conveyance. It is now on its way to a client on the continent. On my return home in the evening on my Benz car I met two of the quads coming along at a good speed, one being driven by Mr. Rucker, the other by Mr. Philipps. As the roads were very dusty it is needless to say that some distance separated the machines, which, being fitted with pneumatic tires, have a nasty habit of raising the dust, which is not conducive to comfort for the passengers in any vehicle following in close proximity.

#### Birmingham Notes.

WHILE visiting Birmingham the other day I noticed Mr Scarborough, who, it will be remembered, was formerly with the Daimler Co., flitting about on a Beeston tricycle with that, to my mind, abhorrence, tube ignition. However, the machine was certainly working well, and I saw it several times before I was fortunate enough to catch the driver's eye. On doing so, however, it suddenly stopped, and I learned a great many interesting things from the aforementioned gentlemen. In the first place he told me of a new steam dray, capable of carrying four or five tons, which has been built by a firm of engineers in Birmingham, and which so far is very satisfactory. In fact, it has brought a load of four tons up the Bull Ring, which is a very steep gradient, at  $3\frac{1}{2}$  miles an hour about. This is certainly a very creditable performance. I am not at liberty yet to mention the name of the firm, but no doubt at no distant date this dray will compete successfully with others. In appearance it is somewhat like the Thornycroft, having a cab in front for the driver, and covering the machinery. Wheel steering is employed, and answers very well, I am told; the wheels are of wood, shod with iron tires, and are very strong.

#### Other Birmingham Items.

THE works lately occupied by the Anglo-French Motor Co. present a very deserted appearance, and are to be let. Mr. Gascoigne, the late manager, is at present with Messrs. Allday's & Onions, who have turned their attention to motors, and have secured his services as manager of that department. Mr. Dünkeley, the perambulator manufacturer, who some time since brought out a gas motor bath chair which bore the peculiar name of the Dunkambulator, has, it appears, dropped the business entirely. Rumour had it that he was founding a large company for the production of his novelties in variety, but like many other things this has fallen through. I have also inspected a new car which is in course of erection, under the designs and superintendence of a Mr. Briggs, at Messrs. Simms' Works, Bradford Road. It struck me as being likely to be a good car when finished, and the engine work was strong and well fitted. Some parts were rather rough, but Mr. Briggs, who by the way was with the Anglo-French Motor Company, is not going to more expense with an experimental car than he is absolutely obliged to do, and, as he acknowledges, he has found out that motors are not so easy to build after all. This car is his third attempt, and, as I say, promises success when completed. The engine has two cylinders, with a  $3\frac{1}{2}$  in. bore and 6 in. stroke, with water-cooling. The motor is in the rear of the vehicle, and fly-wheel aft as in the Benz. The combined fly-wheel and belt wheels run between the cranks, which are

set opposite one another. The engine makes 800 revolutions per minute and gives about 5 h.p. When this car is in a more finished condition I will give further particulars. Two seats are provided, and the car is intended to carry four people. Mr. Lanchester, of Five Ways, is also building one or two new cars.

## THE WHITNEY STEAM MOTOR-CAR.

WE are this week able to publish an illustration of the Whitney steam motor-car which created so much excitement at the Motor-Car Exhibition last week. In our last number we published a few brief particulars of the vehicle, while in our issues of June 2nd and 9th last several illustrations of the details of the Whitney car,

including the boiler, will be found, together with a fairly lengthy description. The gentleman seen in the illustration standing at the side of the car is Mr. Whitney, the builder and designer of the vehicle, and the way he handled it at the Exhibition last week came in for general admiration.

SOME excitement was caused at Bisley on Tuesday by the appearance of a motor-car in the camp. The vehicle was, we learn, a Victoria coupé, driven by Mr. Arthur du Cros.

THE Consolidated Traction Company, Pittsburgh, Pa., is about to add to its equipment an automobile emergency wagon, built by the Pope Manufacturing Company. The new wagon will have a storage battery that will give it a mileage of not less than fifteen miles at an average speed of ten miles per hour on ordinary streets where the average grade does not exceed one per cent. and where the maximum grade does not exceed ten per cent.

W. T. McCULLOUGH, proprietor of the Back Bay Cycle Co., Boston, U.S.A., has opened a branch store, under the name of the Back Bay Cycle and Motor Co., where he is doing a general business in the sale, renting, storing and repair of motor-vehicles. He has eight or ten De Dion tricycles and quadricycles which he rents at 1 dol. an hour, and is making arrangements with parties who have ordered carriages to store and care for them as soon as they are delivered. This is the first store of the kind opened in Boston, and, it is believed, in the United States.

## MOTOR-CARS ON THE CONTINENT.

### The Berlin Motor-Car Exhibition.

ALTHOUGH the part Germany has so far taken in the automobile movement has not been so marked as in France and in this country, yet a good deal of quiet work is being done, an evidence of which is likely to be found at the Exhibition which is to be held in Berlin in September next, under the auspices of the Mid-European Motor-Car Club. This show is likely to be most successful and interesting, as the applications for space have been so numerous as to necessitate a large increase in the space originally provided. The organizing committee have just decided to erect two temporary buildings, in one of which a demonstrating track will be provided.

### A Record Long-Distance Electrical Run in France.

SOME further particulars are available of the electrical vehicle employed by Le Compte de Chasseloup-Laubat in his recent run from Paris to Rouen (84 miles) on one charge of the accumulators. The vehicle, which was constructed by M. Jeantaud, weighed complete 2 tons 140 lb. The wheels were all 41 in. in diameter and fitted with Michelin pneumatic tires. The battery consisted of 80 Fulmen elements (B17 type) and weighed, including the trays and connections, about 16 cwt. 78 lb.

### More Motor-Car Races in France.

ARRANGEMENTS are at present in hand for still another motor-car race in France. It is to be run off about August 15th, the course being from Malo to St. Omer and back *via* Calais, a total distance of about 120 kilometres.

### Electrical Vehicles in Italy.

WE learn from an Italian correspondent that a company has just been formed in Milan with the title La Società Italiana di Vetture Elettriche Turrinelle & Co., to construct electrical vehicles. The Company has already had a car built in Paris in accordance with its designs; it is convertible from a coupé to Victoria and *vice versa*. Two electro-motors are provided, one to each of the rear road wheels, and are stated to have a capacity of 4 h.p. The battery consists of 44 accumulators of the Faure type; its weight is stated to be 453 kilog.; and its capacity, a run of about 62 miles. The vehicle complete weighs about 1 ton 3½ cwt.

### The Gobron-Brillié "Silent" Motor-Car in Belgium.

It is announced that Messrs. Gobron and Brillié of Paris have ceded the Belgian rights in the "Silent" motor-car to M. Nagant of Liège, who is arranging for the manufacture of the same in Belgium. A brief description of this vehicle, it may be remembered, was given in our report of the exhibits at the recent Richmond Automobile Show.

### A Serious Accident in Paris.

PARTICULARS of the death in a motor-car accident of M. Duchemin, the well-known journalist, are to hand. Unfortunately, one of the two engineers who went with him was also killed. When the accident took place the car was, according to a telegraphic despatch, making its trial trip on the road from Vailly to Jars. The vehicle was going at the high speed of forty-five kilometres per hour, and at a sharp turn in the road it ran against a rock at the far side. M. Duchemin was thrown out and his spine broken, death being instantaneous.

### The Sphinx Petroleum-Spirit Motor.

LA SOCIÉTÉ DES MOTEURS LE SPHINX is the style of a new concern which has just been registered at Levallois-Perret, France, with a capital of £9,000, to manufacture the "Sphinx" petroleum-spirit motor, recently described in this journal.

## SCOTTISH NOTES.

### Not a Motor Accident.

AN accident of a somewhat serious character took place three miles from Lanark on Saturday last. A horse-drawn *chars-a-banc*, with a party of the Busby Football Club, numbering twenty-five to thirty persons, was upset through the failure of one of the wheels, and the whole of the party were precipitated to the ground, with the result that while all were more or less injured some half a dozen were seriously so. This accident, which occurred in a locality which is a favourite resort of Scotch motor-cars, was reported in the general press in the form of an obscure paragraph of some six or eight lines. Had this been an accident to a motor-car, caused either in the same or any other way, the paragraph would have received the most prominent position, with headings in leaded type. The attitude of the general press is, no doubt, being modified to reflect the up-to-date public feeling with regard to the motor-car movement, but much still remains to be desired. Considering the large number of motor-cars now in use and the comparative inexperience of many of the owners the infrequency of accidents is a striking testimony to the safety of the new vehicles.

### The Holiday Carnival.

GLASGOW and the big industrial populations of the West of Scotland are this week holding high holiday. The public works are closed for eight to ten days, and the favourite country and seaside resorts are full to overflowing with the holiday-makers, and from the various places privileged to have public motor-car services reports of highly satisfactory traffic receipts have reached me. At Ayr especially is this the case, the number of visitors to the land o' Burns being apparently greater than ever. This district, which is one of the most popular in Scotland, is served by the Glasgow and West of Scotland Motor-Car Co., Ltd.

### The 1900 Boom.

A STRIKING evidence in support of the belief expressed in last week's *Motor-Car Journal* that the year 1900 would witness a general boom in motors in this country reaches me this week. From a source which I have usually found reliable I understand that Stirling's Motor-Carriages, Ltd., of Hamilton, have orders now on their books for something approaching £125,000.

### Management of Motor-Cars.

I HAD the pleasure of meeting Mr. James Burns, town clerk, Motherwell, on his Daimler wagonette last week. Mr. Burns informed me that he had covered something like 1,500 miles in the course of the short time which he had been using his car, and during that period he has been able to manage the vehicle entirely without assistance; and as I believe this car is in daily use it is a very convincing proof of the simplicity in the management of a well-made motor-carriage, and also a testimony to its reliability. Mr. Burns informed me that he was starting on Wednesday for a few days' tour in the Highlands.

"BROWN HEATHER."

## THE NEW JEANTAUD FORE-CARRIAGE SUSPENSION.

**M.** CH. JEANTAUD, of 51 Rue de Ponthieu, Paris, the well-known French builder of electrical motor-vehicles, has lately devised a new method of supporting the fore-carriage of motor-cars, which, it is claimed, while not reducing the degree of "lock" permitted to the wheels, ensures a perfect connection between the vehicle and the fore-carriage. Fig. 1 is a transverse section, Fig. 2 a front view, and Fig. 3 a plan of the new arrangement. As will be seen from Fig. 3, it comprises two springs arranged parallel to, and one on each side of, the front axle *b*,

FIGS. 1, 2 AND 3.

and supported on arms *c* in such a way as to form a parallelogram. The "body" of the vehicle *e* rests on the centre of the springs by the intermediary of two supports *f f*, around the axes of which it is free to oscillate. The links *d* which connect the springs to the arms *c* are so arranged that, while allowing the springs all their elasticity, any lateral displacement of the same is prevented, although no guides are employed. M. Jeantaud claims for the new arrangement that it permits the wheels to be locked to go degrees, and to be turned without slip, at the same time reducing the chance of accident to the fore-carriage.

### Motor-Car Fright at Maidenhead.

THE unfortunate accident at Maidenhead, by which Miss Bulkeley lost her life, seems, from correspondence we have received, to have thrown the people of the locality into something approaching panic, and the violent tirade of Dr. Gordon Stables has doubtless contributed to the unnecessary feeling of alarm. Motor-car drivers recognise their responsibilities, and are not likely to go beyond legal limits. We have not heard of any dangers from such causes having yet been experienced at Maidenhead, and in the late accident the temper of the horse, which has, we since learn, been destroyed, was to blame. A warning to drivers of motor-cars and cycles to proceed leisurely through the narrow streets of the town has been issued by the Mayor, and the residents should be re-assured by the fact that stringent police regulations are to be enforced. At the coroner's inquest concerning the death of Miss Bulkeley, Dr. Charpentier, the driver of the car, was exonerated from all blame. Commenting on the sad affair, Dr. Gordon Stables, whose wanderings in his caravan has attracted much attention, makes a furious attack on "motor-car madmen," and talks of the "murder of poor Miss Bulkeley" in a most impassioned and prejudiced vein. Seeing that Dr. Charpentier rendered help to the injured lady, and that he was exonerated by the jury, it does not do credit to Dr. Gordon Stables that he should have let his pen fly in such a highfalutin' manner.

## SCENES AT AGRICULTURAL HALL.

VIEW OF ELECTRICAL UNDERTAKINGS', LTD., STAND.

VIEW OF MESSRS. NOÉ BOYER & Co.'s STAND.

VIEW OF MESSRS. DE DION-BOUTON'S STAND.

## MOTOR-CAR SHOW AT DOVER.

SIR W. H. CRUNDALL, J.P., Mayor of Dover, having suggested an exhibition of automobiles to be held simultaneously with the meeting of the British Association at Dover in September, this has now been arranged, and will be held on the Athletic Grounds. As the British Association's meeting will be held in conjunction with that of the French Society taking place at Boulogne an interchange of visits will be made, which should add to the value of the proposed exhibition, of which Mr. Frank E. Beeton, Park Street, Dover, is the secretary.

On Tuesday, September 19th, the Mayor will hold a reception on the ground and declare the show open, and a parade will be organized round the track for those machines which are suitable for the purpose. The parade may be extended through the town in the evening. On the Wednesday and Thursday it is proposed to have competitions and judging for prizes.

The conditions of competitions have not yet been decided, but a thoroughly representative judging committee will be chosen, and prizes or certificates awarded for (1) Excellence of driving mechanism; (2) Novelty of purpose or design; (3) Elegance of design and workmanship; (4) Utility of vans and other automotors; (5) Practical running and general control of automobiles; (6) Economy of fuel; (7) Speed in actual racing.

The object of the show being primarily to provide an interesting display and to benefit the motor-car industry, it is proposed to make only a small charge for space to cover cost of erecting tents and other expenses, and the fund will be added to by town subscriptions for the provision of prizes.

## CORRESPONDENCE.

TO THE EDITOR OF *The Motor-Car Journal*.

SIR,—As promised in my letter of last week I now give you my experience and opinion of motor-caring. On Wednesday last I was invited to try my nerves on a Daimler motor dog-cart. The run was in connection with *The Motor-Car Journal's* "efficiency trials," and was from the Agricultural Hall to Baldock and back, seventy-two miles, with no stoppages except at Baldock. The time test was severe when you take into consideration the traffic to steer through and the hills to climb, such as Highgate, Barnet, and several others, both long and steep. Whoever laid out the route meant to give the public some idea of the capabilities of motor-cars. Imagine coasting down hill with the sixteen miles per hour gear on, and then allowing the car to increase its momentum until arriving at the bottom, where several sharp turns had to be negotiated, with heavy traffic coming in the opposite direction. This would try the nerves of any one not acquainted with the fact that the brake is so powerful that the car can be slowed down to a crawl, and then to a dead stop in twice the car's length. To a passenger riding on a car for the first time it means holding your breath and saying your prayers. I am informed by a friend from Paris that the mishaps to motor-cars compare favourably with mishaps to horses; and as the business of motor-car manufacturing increases, and with our high-class engineering, we shall have them as near perfection as possible.

If the manufacturers want to hasten the boom for motor-vehicles they should send down a few cars on Sundays to Epping Forest, route through Whitechapel, Mile End, Bow, Stratford, Leyton, Leytonstone, and on to the Forest Hotel, where they would have plenty of metal to compete with, as there are hundreds of trotters and A1 turns-out on the road all day long.

Next week I propose to give you the opinions of some of my lady friends on motor-caring. Yours truly,  
July 18th. Mrs. SUBURBAN VILLA.

## ADVENTURE WITH A MOTOR-CAR.

EDGAR HARRIS, an engineer, in the employ of Mr. Frank Morris cycle dealer, King's Lynn, was charged at the Southwell Petty Sessions with driving a motor-car more than twelve miles an hour in the parish of Upton on July 3rd. He had not arrived when the case was called on, and service of the summons was proved by affidavit. When the second witness was giving her evidence he arrived, and what had been said previously was read over to him. He pleaded not guilty.

Mrs. Elizabeth Flint, of Ley Fields, whose husband is employed by Mr. Waddington, said: On Monday, July 3rd, I was driving a pony and trap from Averham Flash. It was in the morning. My sister was with me, and we heard something coming along the road before we could see it. The mare began to play up, and we pulled her into a gateway as far as we could get out of the road. We were going from Averham to Upton. The car was going at the rate of between twenty and twenty-two miles an hour. The man could not pull up. It would be going down-hill for some distance. The motor was going towards Newark, and it had got over the bridge just coming down the hill. The man kept coming on with the car, though he could see the mare dancing about. She turned round and fell down on one side and broke both knees. She also broke the shaft and hurt my sister. The defendant waited some time before he came to my assistance; he did not come until I invited him to come and help me. My sister was in the trap and fainted, and did not speak a word until half an hour afterwards. It gave me a shock. We did not fall out of the cart, but my sister fell down in the cart and I fell on the top of her. I can't remember how we got up nor anything about that, it frightened us so. When the mare fell down the car got past but not before she was down.

General Warrant: Was he trying to stop?—He had plenty of time to stop, because he could see the mare dancing about.

Cross-examined by defendant: How do you know the car was going twenty miles an hour?—I thought so because you could not pull up or you would have done.

How do you know what pace it was going?—To my thinking it was.

You mean to say you guessed at it?—If you had been a man—

We are not talking about whether I was a man or a woman.

General Warrant: Wait a minute, how do you know that it was going twenty miles an hour—you say it was to the best of your judgment?—Yes.

Defendant: You didn't hold up your hand to stop?—We were frightened. If you had been a man you would have seen the mare.

Never mind about being a man, I want to know what you were doing. When you saw the car you pulled the horse back on its haunches and broke the shaft?—You drove the thing near us.

I was on the right side of the road. I knew nothing about the summons till I got to Lynn.

General Warrant: His question is, Did you pull the horse up and make it tumble over, breaking the shaft?—No.

Mrs. Hannah Elizabeth Flint, sister-in-law, said: On Monday, July 3rd, I was in company with the last witness. I live at Park Leys, and am the wife of a labourer. We met the defendant driving the motor-car. I should think he would be going about twenty miles an hour; he was going at a great speed. He was going down the bit of a hill against Upton. The fright of the motor-car caused the pony to fall down, and it broke both its knees; it also hurt its side, breaking the shaft. I could not tell anybody what was the matter with me. I was miserable for some time.

By defendant: Which side of the road was I on?—On the left side, but you did not stop while the mare was down.

General Warrant: Was he on his proper side of the road?—Yes.

Defendant: Did you make any motion or hold up your hand for me to stop?—No, it took me all my time to hold the mare I was driving.

It did not take both of you to hold the mare. One could have held a hand up if you had wanted me to stop.—It was in your place to stop when you saw the mare.

It was not my duty to look after your horse; I have to look after my car. You said you fainted. How did you manage to get the horse up? You held the horse's head and danced round it.

General Warrant: Was the horse dancing about so that he could see it?—Yes; he could see it before it fell.

William Stimson, County Council roadman, said: I live at Upton. On Monday, July 3rd, I was at work on the road leading from Upton to Averham Flash. On the Upton side of the bridge I saw the defendant driving a motor-car. It was half-past ten or a quarter to eleven. I could not say what speed he was going, but he was going a tremendous pace down that hill.

Superintendent Hopkinson asked the witness if he could tell what pace the car was going.

General Warrant: He is quite fair. He says he can't tell; but he was going a tremendous pace down the hill.

In reply to further questions, witness said he did not see the accident, and was 150 yards away.

Defendant, in addressing the magistrates, said a telegram had been sent to the Daimler Car Company at Coventry asking whether it could travel more than twelve miles an hour. He produced a telegram to his employer in answer, which stated that it was geared to travel twelve miles an hour, and could not go faster. These Daimler cars were geared to go a certain number of miles an hour. This one was a wagonette to carry eleven. He brought this car from Lancaster, starting on Saturday morning, and got to Lynn on Monday night, 192 miles, or an average of seven miles an hour.

General Warrant: It is well known that these cars are geared to go four, eight, or twelve miles an hour; but surely when going down hill you can exceed that?—Defendant: It all depends on the hill.

Mr. Wright: Do you shut the motor off?—Yes, when going down hill. If it over-runs the motor, the brakes are applied.

General Warrant said defendant had made a statement, and he could give it on oath if he liked.—He then went into the witness-box, and deposed to many of the facts already stated. He said: I think the car was not going more than twelve miles an hour.

General Warrant: But it is not a matter of thinking; you are on your oath now. Do you say positively it was not going more than twelve miles an hour?—It would not go that unless it was a steep hill.

But it was a steep hill, wasn't it?—I don't think it was. They did not hold up their hands for me to stop, and the horse was not restive. It was not dancing about at all. The driver pulled the horse back on its haunches, and it fell on its side. I stopped the car and got down and assisted this woman to extricate the horse, which was not hurt as far as I could see. One of these witnesses was reviling me the whole of the time.

General Warrant: We need not go into that—that has nothing to do with it. What we have to do with now is your case, whether you were going more than twelve miles an hour.

Mr. Wright: Can you tell why the horse fell?—Because it was pulled back on to the grass.

Supt. Hopkinson: Did you notice if its knees were broken?—No.

Did you see the woman faint?—No, neither of them did, because one had a lot to say, and the other tried to assist the pony on. I got there immediately the accident happened. I did not sit in the car. The motor was disconnected from the car; it was not driving the car.

Would it increase the speed?—No.

Did you run past them before you stopped?—I stopped a distance of six or ten yards from them.

Will you swear the car will not travel more than twelve miles an hour down-hill?—It would depend on the steepness of the hill. That's not the case.

Supt. Hopkinson: Yes, it is.—Defendant: It is not justice to me. A bicycle will do the same if the brake is not put on when it is going down hill.

General Warrant: Had you a brake?—Yes, certainly.

Did you use it?—Yes, or the car would have got away.

Mr. Wright: What weight is it?—About a ton.

General Warrant: You say that as soon as the horse got on the grass it tumbled over. Was it a bad place on the grass?—If the horse was pulled back it was bound to fall.

The roadman was recalled, and in reply to questions from the Bench said the place where the pony was pulled to was not even ground; it was going in a gateway.

General Warrant said the magistrates were of opinion that defendant was driving over twelve miles an hour. They knew the hill, and it was a narrow, steep hill, and there was no doubt whatever that he was going a considerable pace. It appeared that he had been cautioned at Hunstanton Petty Sessions for fast driving a light locomotive, and the present was not his first offence. He would have to pay £2 and costs.

Superintendent Hopkinson asked the Bench to allow 2s. each to the three witnesses, and this the magistrates agreed to.

The fine and costs amounted altogether to £2 19s., which defendant immediately paid.

### ANOTHER FURIOUS DRIVING CASE.

CHARLES HIGGS, of Upper Gloucester Place, Regent's Park, was summoned last week for furiously driving a motor-car to the danger of the public. Police-Constable 237 D said that the car was being driven along the Park Road at quite fourteen miles per hour. The defendant stopped at a public house, and his name and address were taken. The defence was that the speed was not so great as that stated. The defendant was fined 10s., with 2s. costs, or seven days imprisonment.

### A REGRETTABLE ACCIDENT.

ON Monday morning, between 11 and 12, as Mr. Leonard Bentall, J.P., was driving himself in his dog-cart through Langford to Maldon, a motor-car and two motor-tricycles came rapidly down the railway bridge. Mr. Bentall, hearing the warning signal, pulled aside, and the car passed by, but one of the motor-tricycles seems to have frightened the horse, which swerved sharply, and ran up the bank, turning the cart on its side, and precipitating its occupant heavily on to the road, flinging him some yards. The animal then turned round, and the cart catching against the stump of a tree pulled it out of the ground, finally colliding with an elm tree. The vehicle was smashed to pieces, and, the harness breaking, the horse became free. The second motor-tricyclist, seeing that the road was blocked by the horse and cart, and Mr. Bentall lying in the way, turned into the hedge, was thrown off his machine, but was not injured. Meanwhile, Mr. Bentall was taken into the Langford Post Office, opposite to which the mishap occurred, and Dr. W. E. Facey was summoned. The sufferer was in an unconscious state, and would appear to have sustained concussion of the brain. About two o'clock Mrs. Bentall was informed of the occurrence, and was shortly afterwards driven

over to her husband's bedside. Drs. Facey and H. Reynolds Brown visited the patient, who up to a late hour in the afternoon had not recovered consciousness, and it is feared the base of the skull may be fractured.

### A MOTOR SMASH.

AN exciting scene occurred in High Street, Sittingbourne (Kent), on Tuesday morning. A team of horses attached to a farm wagon was proceeding through the street when the horses took fright at a motor-car, and two of them broke loose. One dashed clean into a draper's shop window, shattering the glass and literally wrecking the window. The animal died from its injuries.

Later information shows that the motor contained Mr. and Mrs. Hugh Campbell, of 63 Belsize Park, Hampstead, and Mr. and Mrs. Arthur Hordern, also of Belsize Park. They were travelling back from Margate to London. The car was under the charge of Mr. George Bence, engineer, of Watford.

The wagon attached to three horses collided with the motor-car, throwing the occupants out, and damaging the car; after which the three horses tore down the street at a terrific rate. The two leaders broke away from the third animal in the shafts, and the poor beast, with a couple of tons weight behind it, headed straight for the large thick plate-glass window of the draper's shop. It went clean through this, and then dropped down dead in the middle of the shop.

A servant girl who was sweeping the shop at the time had a miraculous escape.

The occupants of the motor-car were bruised and shaken, the ladies naturally being very frightened. The party are now staying at the Shakespeare Hotel, Sittingbourne.

### MOTOR-CAR ACCIDENT.

MISS THERESE RODNEY, a lady residing at 3 Vyvyan Villas, Bayswater, was driving her own electric motor-car along Shenlake road, W., on Saturday morning last, when a little girl ran suddenly into the road and would have been knocked down and run over by Miss Rodney's motor-car but for that lady's promptitude in steering her vehicle on one side. By doing that, however, she brought her car into the way of a brewer's dray, and the shock of the collision sent the motor on its side, and threw Miss Rodney out on the road. When picked up she was found to be severely injured, and was at once put into a cab and taken to the hospital.

## TO CORRESPONDENTS.

All communications intended for insertion in this Journal or relating to Editorial matters should be addressed to THE EDITORIAL DEPARTMENT, MOTOR-CAR JOURNAL, 39 and 40 Shoe Lane, London, E.C. Letters must in all cases be accompanied by the name and address of the writer, as no notice will be taken of anonymous communications.

The Editors cannot undertake to return MSS. or drawings, although every effort will be made to do so in the case of rejected communications. Where such are regarded as of value, correspondents are requested to retain copies.

The Editors do not hold themselves responsible for the opinions expressed by their correspondents, or for statements and facts which do not appear in the editorial columns.

The Editors and Publishers beg also to state that they will accept no responsibility for unsolicited contributions, even if used, unless payment for same is directly specified in forwarding, and the terms arranged before publication.

To insure insertion communications and contributions must be in the Editor's hands by Wednesday forenoon of the week in which the same are intended to appear. Disappointment may be caused by non-compliance with this rule, and to avoid this earlier receipt, if possible, is necessary.

## COMMENTS.

### The Liverpool Trials and the Automobile Club's Policy.

AT the Richmond dinner on Monday, Sir David Salomons, in referring to the Liverpool Self-propelled Traffic Association's forthcoming trials, stated that it was not his intention to subscribe to or have anything to do with any movement in the automobile world that was not originated by the Automobile Club, but that if the Club started a fund he would subscribe towards it. This statement coming from Sir David Salomons is an important one, and as such should be reflected upon by the vast numbers of riders and others interested in automobilism who are not yet members of the Club. Monopolies are objectionable to English people, and cannot be tolerated. It is well known we have been staunch supporters of the Club from the first, and, notwithstanding our little friction of last year, we have continued to give the best of our support. But we are afraid we cannot follow the latest move and ignore all motor-car movements outside of the Club. If the Club is to exist for the good of the industry every effort to popularise motor-cars should be supported in an official way if possible; and, where not, the members should be allowed freedom to act as discretion dictates. The Liverpool Self-propelled Traffic Association, which is an affiliated branch of the Club, is suffering this year from a lack of financial support—noticeable, unfortunately, in the case of many of those who, last year, were its staunchest supporters. We consider that the trials which take place next week are the most important yet held, and should be supported by the entire industry of the kingdom. Certainly we hope our readers will recognise this by attending in numbers to support Mr. Shrapnell-Smith, the Honorary Secretary, at Liverpool on Monday and the following days.

### The 1900 Exhibition.

THE date fixed for next year's Motor-Car Exhibition, to be held as usual at the Agricultural Hall, Islington, is from Saturday, April 14th, to Saturday, April 21st, and to ensure a large attendance of interested people we have, to the sacrifice of the gate money, decided to give every exhibitor twenty tickets of admission for every pound paid for space taken. There is no doubt each exhibitor will distribute them in such channels as he thinks will bring most customers, and so the value of the Exhibition as a means of business will be enhanced—even when compared with the recent Agricultural Hall success in that direction.

### The Richmond Automobile Show.

A SPECIAL meeting of guarantors of the Richmond Show, manufacturers, and others was held at the Automobile Club House, Whitehall, on Tuesday last. There were about twenty members, guarantors, and manufacturers present, and it was decided to hold an exhibition next year,

commencing March 24th, and closing on Saturday, April 7th. The announcement was made that the deficit on last year's exhibition was so much—a very heavy amount; but the chairman, Mr. Beaumont, stated that the information was private. To this we take exception, as the guarantors, we consider, were in the position of shareholders at a company meeting, and as such in a position to use the information as they like. The loss was a very heavy one, and altogether out of proportion to the results achieved. Upon this matter we can speak with authority, and trust that a full balance-sheet, showing receipts and disbursements, will be forthcoming to those who guaranteed the Club against loss, and who have incurred the financial liability.

### Raising the Speed Limit.

GENERAL CAREY's speech at Richmond was a welcome one, and we are glad to see that the Automobile Club have not lost any time in making a move in the matter, as will be seen by a letter in another portion of the present issue. The light passenger vehicles, we consider, can well look after themselves; but it is the vehicle of 30 cwt. and upwards to which the law should give greater freedom. Many and various are the modifications that are required, and then an enormous development will take place. France for some time, no doubt, will hold its lead for light vehicles; but at present, with the unreasonable restrictions, the possibility of Great Britain having any record in heavy vehicles is remote indeed.

### Motor-Car v. Tram-Car.

LYNESIDE seems the first district to realise the possibilities of the motor-car and its growing development into the "popular omnibus." Frequently have we referred to the additions made from time to time to the motor-car services of Newcastle-on-Tyne, and the coming vehicle of city transit is now so common an object in that city that "nobody turns his head to look as it passes." Having reached that stage its popular favour must be regarded as fully established. There are now three companies engaged in the business at Newcastle. Six new cars have just been put on the roads, and fifty others have been ordered. These facts, coupled with the comfortable, rapid and manageable character of the motor-cars already on the streets, has led the *Newcastle Daily Chronicle* to call for the extension of the motor-car service and the disuse of the powers for tramway construction recently granted by Parliament. "Tramways," says our enlightened contemporary, "are not wanted. They do not and cannot meet the requirements of the community. The tramcar is frequently in the way, and other vehicles are often obstacles to the tramcar. And we maintain that to use the powers obtained for the construction of electric tramways at a cost to the ratepayers of half a million of money would be to abuse them greatly."

### Where the Motor-Car Wins.

Not content with its destructive criticism of tramways, Mr. Cowen's powerful organ proclaims the advantages of the motor-car in the clearest possible way:—"In addition to furnishing comfortable riding it gets over the ground quickly—in about one-third of the time occupied by the tramcar. The motor-car has no horses to fall down, and no need to slacken speed because a brewer's dray or a railway trolley is on the track. Short, light, and manageable, the motor-car worms its way amongst the traffic, going where it listeth with the utmost facility. It can always outflank a lumbering wagon; and, within limits, all roads lead to its destination." Such statements are well calculated to inspire the public with confidence, and we are glad to see that the duty of the Corporation is equally plainly set forth: "It ought to substitute good roads for those which at present are the worst in Europe outside Russia, and leave the rest to private enterprise and the motor-car."

### Cost of Horse Keep.

THE utilisation of the motor-car at Sir Weetman Pearson's garden party, as recorded in our columns last week, proved its advantages over horse-drawn vehicles in a very noteworthy way. A few figures relating to the keep of horses will be of interest to those about to adopt the motor-car, and the chairman of the London Improved Cab Company, Ltd., has just given the exact information required. During the year ended May 31st the prices of corn and other feeding stuffs were favourable to owners of horses. Hay and mixtures were of exceptionally fine quality and remarkably cheap, so that no under-estimating need be feared in the following figures: The cost of feeding each horse, 7s. 3½d.; litter cost, 3.72d. per horse; and shoeing averaged 1s. 4d. per week in each case. This was in a year when the health of the animals was extremely satisfactory, and seeing that the stock of the concern numbers 439 vehicles, the average may be regarded as a very fair estimate of the cost of keeping horses on a large scale, although, of course, it will amount to considerably more in the ordinary way.

### A Growl from the Stable.

WE wish the Editor of the *Stable and Kennel* had been present at the dinner of the Automobile Club on Monday, for he would have learned that there is no prejudice against horses among those who appreciate the motor-car. As Mr. Harmsworth reminded the company, the guest of the evening, Baron de Zuylen, has perhaps the finest stables in Europe and several of the gentlemen present love the horse as strongly as they like the motor-car. In fact, both in France and in England, the best patrons of the industry are to be found among horse owners. That being so, we are surprised that, like a certain financial daily, the *Stable and Kennel* should so frequently snort and bark against the inevitable—for such the motor-vehicle can be regarded. "For Heaven's sake," cries our alarmed contemporary, "let us pause and soberly consider the price we may be called upon to pay for adopting the present fatuous horseless-carriage craze, without proper safeguards for the security of life and limb." If the Editor's nervous state is as bad as that he had better stay in his stable—or kennel.

### Backward America.

WE have become so accustomed to regard the United States as being such an up-to-date country that the slow progress of the automobile movement on the other side of the Atlantic is a matter of surprise. Even in America it is recognised that that country is taking a place very low down on the list in the new movement. The *Horseless Age* of New York, for instance, in referring to the

recent motor-car exhibitions in England, remarks that "they afford a fair idea of the many different types of vehicles now on the market in Great Britain, and a realization of our own inexcusable backwardness in putting the new vehicle on a manufacturing basis in the United States. It was not until November, 1896, that the Red Flag Law was abolished in England and it became lawful to use motor-vehicles upon the public highways, yet in less than three years a very noticeable progress has been made." Our contemporary adds:—"If we search for a reason for our own deficiencies in the motor industry we shall not need to look further than the inventors and promoters whose absurd claims and wild-cat schemes have travestied the industry and kept capital and sound business ability aloof from it. Happily the influence of the boomers is on the wane, and sober sense and legitimate enterprise are beginning to prevail. We shall not long be at the end of the procession."

### Motor-Tricycles at the Crystal Palace.

JUDGING from the information we have been furnished, those interested in motor-tricycle races will find a good afternoon's sport offered them at the Crystal Palace on the coming August Bank Holiday. The programme, which will be taken in hand at 1 p.m., comprises a two miles handicap, a five miles handicap, and a ten miles scratch. We learn from Mr. F. W. Baily, the hon. superintendent of the Crystal Palace cycle track, that he has received the promises of nearly all the most prominent motor-cycle riders, and with the experience gained in handicapping motor-cycle races it is expected that the finishes will be much closer than they have been in the past. In addition to the above events, Mr. C. Jarrott having challenged the holder of the Crystal Palace Brassard (Mr. S. F. Edge), the second race for this trophy will be held on the same day. The race will be for one hour, and will no doubt prove very exciting. Mr. Baily also asks us to point out that he is open to receive formal challenges (with, of course, the requisite entry fee) from any motor-tricyclist who would like to endeavour to possess the Brassard at present held by Mr. Edge.

### A Leighton-Buzzard Resolution.

THE Leighton-Buzzard Board of Guardians, at its last meeting, adopted a resolution to the effect that the attention of the Legislature be called to the danger to vehicular traffic by the dangerous speed at which motor-cars are run. The discussion which led up to the adoption of the resolution was of an amusing character. For example, one member stated that "when meeting a motor-car the animal one was driving had to crouch in the hedge, unless it was a donkey or some donkey that could not move. The motor-cars smelt of the infernal regions." Another member doubted "whether the danger from motor-cars arose from their speed, but thought it arose rather from their emitting steam, and their construction." While we do not uphold in any way with motor-car drivers exceeding the legal limit of speed permitted to automobile vehicles, we do suggest that before any public bodies pass resolutions of the kind above referred to its members should make themselves better acquainted with the subject than, judging from their remarks, are the members of the L.B.B.G.

### A Service for Northamptonshire.

A SCHEME is being proposed in Northamptonshire to establish a motor-car service between Bozeat, Wollaston, and Wellingborough, and the promoters have been accorded hearty support in the localities which would be benefited by such provision. At present the communication between these places is very primitive, and not only is it thought that the projected service would prove popular with passenger traffic, but hopes are even entertained of a good revenue from the conveyance of merchandise.

**Carriage Builders' Meeting.**

ON September 12th the Institute of British Carriage Manufacturers will hold its twelfth annual autumnal meeting at York, under the presidency of Mr. S. G. Turner, of Bristol, and the strong local reception committee that has been formed is evidently determined to make the assembly an agreeable and pleasant function. The papers will be by Mr. G. K. Hooper, on the "Suspension of Carriages"; and by Mr. P. W. Northey, on "The possibilities and uses of aluminium as applied to carriage building." Both should be of interest to all engaged in providing for vehicular traffic—whether horse or other motive power; and, seeing the close association between the motor-car and carriage-building trades, some of the enterprising makers of the former may find it useful and profitable to be in York during the meeting of the Institute.

**Suggested Taxation.**

AT Ipsden House, Reading, lives a gentleman named Mr. Henry Hutt, who does not like motor-cars any more than did the Rev. Robert Spalding appreciate London after his quest of a bath bun and an acidulated tablet. And so a local paper has been favoured with a letter, from which we learn that Mr. Hutt once met a motor-car with a broken oil-can that burst and made "such a dreadful smell that the horses I was driving refused to come within twenty yards of it." That cannot be urged against the car, for the sensitive creatures thus avoided all danger by keeping away from a novelty to which they have probably got used by this time. But Mr. Hutt has a suggestion as well as a denunciation to make, and hopes to see motor-cars taxed—we suppose that is an alternative to their drivers being imprisoned. Taxation might restrict the use of these "dangerous machines." In conclusion he asks: "Is it unreasonable for gentlemen or tradespeople who are heavy taxpayers to expect protection" from these things? Unfortunately for his case gentlemen and tradespeople are the two sections of society with whom automobiles are most popular and to whom they are most serviceable.

**Motor-Cars in Manxland.**

THE hilly district of the Isle of Man will provide splendid tests for the abilities of motor-vehicles, and now that they have been legalised in the island a service will be promptly established. The Act has been promulgated with all the ancient ceremony from Tyndwall Hill, and the Manx Company that has undertaken the new venture has already a car on the way. It is of the *chars-a-banc* type, and should prove as popular a service and as good an investment in Manxland as elsewhere.

**Motor-Cars in Chicago.**

CONSIDERABLE excitement has lately prevailed in motor-car circles in America by the issuing of a regulation by the local authorities in Chicago excluding automobile vehicles from the parks and boulevards in that city. It is satisfactory to find that the new movement has already sufficient adherents to take care that no illegal block is put in its way, for, as a result of the test case which was brought before the courts by the American Electrical Vehicle Co., the order has been made void. Judge Gibbons, who heard the case, after remarking that while the Park Board can and should limit the rate of speed it has no more right to prohibit the automobile than the bicycle or the dog-cart, gave the following decision: "The order in question is void in singling out automobiles by name and placing them under the ban of outlawry, when, as a matter of common observation and scientific knowledge, there is less danger in propelling an automobile than there is in driving a horse and buggy."

**An Example for Agriculturalists.**

IT should be of interest to owners of large farms all over the country to learn that the Daimler Motor Co., Ltd., of Coventry, has just contracted to supply no less than three 12-b.h.p. motor-vans to Mr. W. F. Locke-King, of Weybridge. These vehicles are intended for the transport of milk, poultry, and other farm products from his farms in the neighbourhood of Weybridge to the London market. At present the deliveries are made daily all the year round by rail, but it has been estimated that, even after allowing a considerable percentage for depreciation and repairs, there will be a large margin in favour of the transport by motor-van, while furthermore a saving of at least four hours per day in point of time will be effected, which, spread over a year, will be no mean item in itself. Mr. Locke-King is to be congratulated on being one of the first to recognise the advantages of motor-vehicles from a commercial point of view, and the example is one which no doubt will commend itself as worthy of being followed by many other proprietors of large farms in the United Kingdom. In addition to the three vans, we understand that Mr. Locke-King is also having built a 12-b.h.p. Daimler wagonette, which he intends to use for the purpose of paying visits of inspection to his various properties.

**The "Oxford" Motor-Car.**

THE three-wheel two-seated car known as the "Oxford," which was shown to the public for the first time at the recent exhibition at the Agricultural Hall by Messrs. F. Jackson and Co., Ltd., of 77 Oxford Street, London, W., was, we learn, subjected to a long-distance trial on Thursday of last week through which it emerged successfully. Starting from the address given above at 10.45 a.m. the vehicle conveyed its passengers to Colchester and back, reaching home the same evening at 10.30, equal to 11 h. 45 m. for the 106 miles, including stops for refreshment and also a long stay at Colchester. The makers inform us that the vehicle ran without the slightest hitch from start to finish with the exception that when it reached Tottenham Court Road on the return journey one of the belt fastenings broke. A brief description of the "Oxford" car was given in the report of the Exhibition in our issue of July 7th last. The two-speed gear employed is exceedingly ingenious and simple, and when the makers have reduced the somewhat excessive noise made by the motor the vehicle, in view of its relatively low price, should become a popular one.

**Royalty and Motor-Cars.**

AS we briefly mentioned in our last issue, considerable interest was displayed at the motor-carriages which figured at the Bagshot Fair last week. We understand that these consisted of a couple of Messrs. Hewetson's Benz Ideal cars, and from what we can gather Mr. Hewetson and Mr. Cole appear to have had a very busy time in driving the large number of "society" visitors around the royal grounds, the proceeds thereof helping to swell in no small measure the fund of which the Fair was the object. We learn with interest, too, that on Monday evening, the 17th inst., the Duke of Connaught himself was taken for a drive by Mr. Hewetson. We do not know if this was the Duke's first trip on an automobile vehicle, but in any case we understand that he was extremely pleased with his ride. Mr. Hewetson's subsequent passengers also included several other members of the Royal Family, among whom were the Princess Margaret of Connaught, Princess Victoria Patricia of Connaught, and Prince Arthur. Since writing the above, Mr. Hewetson has shown us a letter he has received from Surgeon-Major C. R. Kilkelly, of the Grenadier Guards, in which that gentleman states: "The Duke and Duchess of Connaught desire me to thank you very much for your great kindness in bringing down the motors."

### A Suggested Mutual Protection Society.

IN the course of a long letter to us this week in regard to the case reported in our issue in which Edgar Harris was fined at the Southwell Petty Sessions for driving a motor-car more than twelve miles per hour, Mr. Frank Morriss, of Kings Lynn, the owner of the vehicle in question—a Daimler-Rougemont wagonette—expresses some very strong opinions as to the way in which the evidence of inexperienced persons regarding the speed of motor-vehicles is received by the magistrates. In this case the wife of a labourer stated that the car was travelling at about twenty miles per hour, and although evidence was put in on behalf of the defendant that the car could not travel beyond twelve miles per hour a fine was imposed. Mr. Morriss concludes his letter by suggesting the formation of an Automobilsts' Mutual Protection Society, which should retain the services of a good advocate to deal with further cases of this kind. Mr. Morriss considers that by acting in consort in this way automobilists would receive better consideration at the hands of magistrates, who, he argues, are at present biased in favour of police and outside evidence. We should be glad to receive the opinions of our readers as to Mr. Morriss' suggestion.

### An Owner Wanted.

DURING the course of the Exhibition at the Agricultural Hall there was consigned to us from France a trailer for a motor-tricycle. The vehicle was apparently intended to be placed on exhibition; but, strangely enough, the consignor not only omitted to advise us, but no indication of the sender's name and address was to be found on the crate. In the meantime, we are storing the trailer, and if this note should happen to catch the eye of the sender we should be glad if he would communicate with us.

### Truth.

ECHOES of the recent Exhibition at the Agricultural Hall continue to reach us, and the newspaper publicity thus obtained for automobilism must contribute to the process of establishing it in public favour. *Truth* is on the side of the motor-car, and in a reference to the Motor-Car Exhibition says "it is only a matter of time for motor-traffic to take its place on the road and to be generally adopted." We welcome the conversion of our contemporary, and would suggest to Mr. Labouchere that he should become a motorist and join the Parliamentary Automobile Party, which at present consists of Sir Samuel Montagu, the Hon. J. Scott Montagu, and Messrs. Carlile and Dalziel—two on each side of the Speaker.

### Matabele Chief on a Motor-Car.

PRINCE LOBENGUELA of Matabeleland will have something to tell his dark-skinned countrymen when he returns from the grounds at Earl's Court, where he is now appearing as a warrior in Savage South Africa. Since his stay in this country he has had many surprises, the most startling being a ride through the West End on a Victoria, placed at his disposal by the British Motor Coupé Company. When the vehicle arrived to take him on the trip he wonderingly inquired after the horses, and was at first inclined to regard it as a "devil machine" calculated to carry him forth to regions unknown. At length he mounted, and enjoyed an experience that gradually restored his confidence in British institutions generally and the motor-car in particular. At the end of the outing he proudly patted the automobile as though it were a horse, and probably longed for the day when he may be able to mount a motor-car and return in glory to his old encampment.

## A NEW LIGHT FRENCH MOTOR-CARRIAGE.

THE accompanying illustration shows a neat type of light petroleum-spirit motor-carriage which has lately been put on the market by Messrs. Audibert and Lavirotte of 12 Chemin des Quatres-Maisons, Lyons. The motor is of the single-cylinder horizontal type, capable of working up to 4 h.p., with water-jacket and electrical ignition. It is located in the centre of the rear part of the frame, the power being transmitted by belts from the motor-shaft to the counter-shaft, and from the latter to the rear-wheel axle by the usual sprocket wheels and chains. Three forward speeds are provided, while a reverse motion is obtained by means of a cable which normally runs slack, but which can be tightened

by means of a jockey-pulley controlled by a foot lever. All the speed-control levers are mounted on the steering standard. The road wheels have wood spokes and pneumatic tires. Petrol storage accommodation sufficient for a run of from 200 to 250 kilometres is provided. The makers state that the car can attain a maximum speed of from 35 to 40 kilometres per hour and that it will mount gradients of 1 in 10 at 10 kilometres per hour. The above is only one type of Audibert-Lavirotte car, but the firm are making a number of others, including a four-seated duc, a six-seated Victoria, a four-seated mail cart, a family omnibus, a four-seated Berlin, as also light vans and lorries, fitted with motors varying in capacity from 6 to 12 h.p.

SOME of the cabmen of Herne Bay are raising an outcry against the motor-cars that have lately been placed upon the streets of that rising seaside resort, and in a letter to the local press one plaintively asks: "Can nothing be done to prevent it?"—to which the growing popularity of the local motor-car service seems a negative answer.

A MOTOR-CAR has been landed at Durban, South Africa, for a gentleman in Greytown, who intends using it for traction purposes. The vehicle, which we understand is the production of the firm of Jesse Ellis, of Maidstone, is capable of carrying from ten to twelve tons, and is constructed to carry either passengers or goods.

THE meetings of the creditors and shareholders of the Chitty Dynamo and Motor Company were held on Monday at Serle Street, Lincoln's Inn. The Company was formed in November, 1897, with a nominal capital of £200,000, to acquire the patent rights for the construction of dynamo machines known as Chitty's patent. The Company went into liquidation in June last, the accounts filed showing unsecured debts £32,542, and assets £20,912. The contributories' deficiency is £44,459. The purchase price was £56,000, of which £11,000 was in cash and the balance in shares. The Company went to allotment in December on a subscription of £5,540. Premises were taken at Willesden Junction the same month, but no work was commenced until June following, the gross receipts from which were only £19 15s. 9d. The case was left with the Official Receiver.

## BARON DE ZUYLEN IN LONDON.

### DINNER OF THE AUTOMOBILE CLUB.

IN the historic Star and Garter Hotel at Richmond, the Automobile Club of Great Britain did honour on Monday to the President of the Automobile Club of France, the Baron de Zuylen. Many of those present arrived at Richmond on their motor-cars, and the guest of the evening was driven from London by Sir David Salomons (the Chairman of the Foreign Relations Committee) in his Peugeot carriage.

Mr. Roger W. Wallace, Q.C. (the Chairman of the Club), occupied the chair, and amongst those present were Baron de Zuylen, Sir David Salomons, the Hon. J. Scott Montagu, M.P., the Hon. C. S. Rolls, Major-General Phipps Carey, R.E. (Chief Engineer to the Local Government Board), Professor Vernon Boys, F.R.S., Messrs. Alfred Harmsworth, Frank H. Butler, Sidney Atkins, T. B. Browne, Chas. Cordingley, J. S. Critchley, Staplee Firth, H. Hankey, Geo. Hopkins, W. Hopkins, Alfred Ledger, E. Shrapnell-Smith, W. Worby Beaumont, J. Mann, Mark Mayhew, Stanley Spooner, Lyons Sampson, Percy Northey, Dr. Lehweiss, Carl Oppermann, R. E. Phillips, Owers, Fletcher, and C. Johnson (Secretary).

Letters expressing regret at inability to attend were received from the Duke of Westminster, the Duke of Marlborough, Lord Loch, Lord Battersea, Sir Francis Jeune, the

Hon. Evelyn Ellis (Vice-Chairman of the Club), Captain the Hon. Cecil Duncombe, and others.

After the usual loyal toasts, the Chairman proposed the toast of "The Automobile Club de France," coupled with the name of the president, Baron de Zuylen de Nyevelt. Mr. Wallace said that he was certain he was expressing the feelings of all members of the Club when he told Baron de Zuylen that they were delighted to have the honour of entertaining him. It was in accordance with the wish of Baron de Zuylen that the dinner was taking the form of a family dinner rather than an official banquet; and they welcomed Baron de Zuylen as being one of the founders of the Automobile Club de France, which had done so much to foster the automobile industry in France. In England, constructors were now following in the wake of the magnificent industry established abroad; and although English inventors were, naturally, engaged in original invention, yet all Englishmen recognised the debt of gratitude which they owed to France for having set on foot the road locomotion movement. It was hoped that when Baron de Zuylen came to London next year he would find far more automobile vehicles on the streets and far more people taking an interest in automobiles than at present. No one could say that good work was not being done in this country who had driven on the British-made carriage owned by the Honourable John Scott Montagu, and other British-made carriages of various systems which had accompanied the Club tours; and it could not be denied that amongst the

English automobilists there were excellent and enthusiastic "chauffeurs"—such as Mr. Montagu and Mr. Rolls. The efforts of their guest of the evening had done much to place France at the head of the automobile movement, and that was a very good thing for the French people. Mechanical knowledge was being diffused in a remarkable way in France, and they might look for improvements in other directions than automobilism as a consequence. In the automobile industry of France 5,000 people were actually employed apart from the incidental work which their adoption had entailed and the labour required in driving the vehicles, so that that estimate might be multiplied by two or three. We were developing the industry in this country, and a great deal depended on the driver. The driver had as much to do with the conduct of the vehicle as the manufacturer. Mr. Wallace concluded by thanking Baron de Zuylen for the ready sympathy he had always extended to the Club and to the movement generally in this country, and then gave the toast of the evening, "The Automobile Club de France," coupled with the name of Baron de Zuylen. The toast was most enthusiastically received and the Baron greeted with musical honours.

Baron de Zuylen, in response, thanked the members for the kind way in which they had received the toast, and said it was a great pleasure to him to visit the English Automobile Club. He had always appreciated the difficulties from which the automobile industry had suffered in this country, seeing that the law which prohibited the running of such vehicles on the road had only been recently removed. The French constructors had been studying motor-vehicles for years, and he was sure that England would in the long run turn out excellent motor-carriages. What was wanted particularly was cheaper cars. The demand in France so far exceeded the supply that exorbitant prices were at present paid for the favourite carriages; but when the supply was able to meet the demand cheaper carriages would be produced, and their use would become more general. These remarks applied especially, he thought, to this country. After paying a tribute to the work of Sir David Salomons, Baron de Zuylen gave the toast, "Success to the Automobile Club of Great Britain," and coupled with it the name of its chairman, Mr. Wallace, who replied.

Sir David Salomons gave "The Health of the Visitors." He said there was a time when the majority of the population, including officialism, was against the automobile, but that was fast passing away. Among the company was Major-General Carey, and he (the speaker) trusted he would be inclined towards the new movement as his predecessor (Major Tulloch,) had been, and with the toast his name was coupled.

General Carey, in reply, stated that the Government had at the outset, perhaps rightly, insisted upon certain restrictions in the use of motor-vehicles on the road, as at that time they had no opportunity of testing their capabilities, and they thought it right first to safeguard the general public. The Local Government Board had recently requested the Automobile Club to carry out certain experiments for them with a view to ascertaining whether, as regards certain classes of vehicles, the speeds permitted might be increased. He could assure automobilists that the Local Government Board was fully alive to the importance of the automobile movement and were always willing to consider representations of automobilists, and he had no doubt, would in the long run make such concessions to their views as might in the opinion of the Board be compatible with the safety of the public.

The Hon. J. Scott Montagu, M.P., gave the health of the Secretary of the Club, Mr. C. Johnson, in a eulogistic speech. In his experience of public affairs he had never known a more efficient secretary. The members recognised him as an integral part of their organisation. Referring to automobilists in the House of Commons, Mr. Montagu said there were now four—Sir Samuel Montague, Mr. J. H. Dalziel, Mr. Carlile, and himself—the nucleus, he hoped, of an ever-

increasing party in the legislature of this country in favour of motor-cars. He was glad to have heard the speech of General Carey, and to learn that there was a chance of the regulations being relaxed and a higher speed being permitted. The motor-vehicles were more easily controlled and more easily stopped—(laughter, as the speaker glanced at the representative of the Local Government Board)—than horse-drawn carriages.

Mr. Johnson briefly responded, heartily thanking the company for their remembrance. After all, his work, he said, was to carry out the instructions of a number of gentlemen who gave up their time for the benefit of the Club.

Mr. Roger W. Wallace proposed the toast of "The Press." He stated that as the dinner was of an informal nature members of the Press had not been invited to be present, but he was glad to recognise at the table members of the Club who were also proprietors of important technical journals. He had already had an opportunity at a recent meeting of the show committee of thanking the technical press for the ready assistance they had given the Club in its endeavours to promote the automobile industry; but on this occasion, seeing that Mr. Alfred Harmsworth was present, he wished more particularly to refer to the general press, and to couple with this toast the name of Mr. Harmsworth. Mr. Harmsworth had stepped out from amongst the proprietors of other London morning papers, and had declared boldly in favour of automobilism. It required no small amount of courage for a newspaper proprietor to stand up for a new movement which was receiving so cold a recognition in so many quarters. He (the chairman) felt certain that it would give members of the Club a special delight to show Mr. Harmsworth how thoroughly they appreciated his action in this matter.

Mr. Alfred Harmsworth, in replying, stated that apart from the support to automobilism which had been rendered by the newspapers with which he was connected, he was himself an enthusiastic automobilist, and he believed most thoroughly that the movement had an enormous future in this country. He thought that the inhabitants of the United Kingdom could not over-rate the great stimulus which the French people had given to mechanics, and he hoped that thanks would always be given to the French constructors for this veritable mechanical triumph. With reference to the unnecessary fear in some quarters that the motor-car would supersede the horse, the same assertion was made on the introduction of the bicycle. Horse owners were the best friends of the motor-car. English people were particularly fond of horses, and Baron de Zuylen had the finest stables in Europe. In France it was among the horse-owning people that the automobile first became popular. A day or two before he had seen Lord Shrewsbury driving a fine team of horses, and later in the day a motor-car with equal dexterity.

The Chairman read the telegram announcing the result of the Tour de France race, which had kindly been sent to the Club by the Editor of *Le Matin*. The following reply was read, unanimously adopted, and despatched to the Editor of *Le Matin*:—"Members of the British Automobile Club, at the dinner at which Baron de Zuylen honours them with his presence, beg to thank you for telegraphing the results of your interesting race. They beg to congratulate you on its splendid success, and ask you to convey their hearty congratulations to the successful competitors. Baron de Zuylen joins in these congratulations. Please accept my compliments. Roger W. Wallace, Chairman of the Automobile Club of Great Britain, London."

The Chairman then gave the toast of "The Judges," and coupled with it the names of Professor Vernon Boys, F.R.S., and Mr. W. Worby Beaumont. Mr. Beaumont responded.

Sir David Salomons, with reference to the forthcoming trials of the Liverpool Branch of the Automobile Club (viz. the Liverpool Self-propelled Traffic Association), stated that in his opinion subscriptions towards these trials by members of the Club should, if made at all, be made through the

central body and not directly to the branch, and that if a fund were started at the London club-house towards assisting in defraying the cost of the Liverpool trials he would be glad to subscribe twenty guineas.

The Chairman stated he thought such a fund should be started at the London club-house, and that he would be pleased to add twenty guineas. Mr. Frederick R. Sims, the vice-chairman, also stated that he would be glad to subscribe five guineas, and Mr. Ernest Owers likewise offered a similar amount. The Chairman expressed a hope that other members would subscribe to this fund.

Mr. Shrapnell-Smith, the honorary secretary of the Liverpool branch, spoke as to the forthcoming trials, and concerning the Liverpool branch, and said that the Council of the Liverpool branch had expressed the hope that members of the central body would make a point of being present at the trials which were to commence on Monday next, the 31st instant.

Baron de Zuylen then announced to the Club that Mr. Gordon Bennett had recently informed the Automobile Club de France that he intended to lodge in their hands a magnificent gold cup as an International Automobile Cup, that challenges for this cup might be sent through the recognised automobile club of any country, and that any nation which could win an International race against France would become the holders of the cup. He (Baron de Zuylen) would be looking forward to receive at no distant date a challenge from the British Automobile Club for a race for this cup.

The return journey from Richmond was made by many of the party on automobile vehicles, and this concluded a pleasant and memorable evening.

AN ordinance requiring fenders on all motor-vehicles is to be introduced in the Chicago Board of Aldermen, and a loud protest has been raised by the local manufacturers on the ground that the fenders would prove a disfigurement.

MR. C. JACKSON, of Avenue House, Bakewell, in a communication this week, states that he is thinking of purchasing a motor-tricycle, but before doing so wishes to have an opportunity of giving one a good trial by having a machine on hire. We think he should have no difficulty in doing this, and would recommend him to communicate with the makers or importers of motor-tricycles, among whom are the Motor Manufacturing Co., Ltd., the Beeston Motor Co., Ltd., the London Autocar Co., and Messrs. Brown Bros., Ltd.

A GLOUCESTER correspondent, signing himself "H.D.G.," asks if motor-tricycles are injurious to ride for touring, "as they appear to me to be full of vibration." Given a comfortable saddle, our correspondent need, we think, have nothing to fear on this score. As to his second query, "Is there much or any trouble with the electric ignition," we can only reply that occasionally a little trouble arises, but nothing of a serious character. To repeat an opinion already expressed in these columns, this type of ignition device is the best and only one suitable for motor-tricycles.

MR. JOHN C. HENRY, a well-known electrical engineer, of Denver, Col., is building an electric vehicle to exemplify some important improvements he is said to have made in regenerative controllers, by means of which a vehicle will be accelerated and controlled with one lever. The same handle that turns on or off the current operates the brakes. In short, the motor is converted into a dynamo, and when the current is shut off the momentum regenerates electricity, storing it in the battery, and checks the vehicle at the same time. In going down grade the power that would ordinarily be pressed against the mechanical brakes is transferred to the battery, so that it is replenished, and the vehicle is at the same time held in check, and runs with a regularity as on level ground. The steering will also be electrical. In place of the present system the motors will be so arranged that by a simple turn, it is said, the machine can be steered around a corner or zigzag with more accuracy and rapidity than mechanical steering would permit.

## SCENES AT BOLNEY COURT. (Mr. Frank Butler's Houseboat.)

## MIDLAND MOTOR NOTES.

By "VERAX."

## The Endurance Motor Co.

IN course of conversation with one of the directors of this Company this week I learned that they are very busy indeed fulfilling orders, at the present moment having contracts for about twenty-six motor-frames and motors, deliverable at so many per week. The directors have been so encouraged by the success of the Endurance car at the late Show, and by the number of orders obtained from it, that they have increased their capital, and will enlarge their works considerably to cope with the orders they have obtained, which, judging by their past success, will doubtless be the means of keeping them very busy in time to come. The Company have been working now for some time in a quiet way, and have, after much experience with various types of engine, at last succeeded in making a fairly good motor, which embodies parts of several well-known makes. The horizontal engine, as placed in their car, is in some respects similar to the Benz, but the driving gear, which comprises belts running on fast and loose pulleys, is controlled by one handle, so that it is impossible to put both gears on at once—which does not in this type of car improve the belts or the gearing. All the parts, too, which are liable to damage, such as the ignition plug, etc., are of large size and amply strong. The performance of the Company's car at the recent Show, which is only the second car they have built throughout, at any rate proves that they can build not only a car which is respectable in appearance and workmanship, but one which at the same time is capable of a very good performance on the road, both as regards distance travelled and time taken in transit. At all events this Company is doing good work, and it is deserving of every success to which it may attain.

## Other Coventry Firms.

THE Motor Manufacturing Co. are very busy indeed, and are very much pressed with work just now. To them is entrusted the manufacture of the wagonettes and *chairs-a-bancs* which are now being delivered to our northern towns, viz., Newcastle, Sunderland, and Edinburgh. When I was at the works I saw one of these wagonettes, resplendent in its dark blue coat and deep red lining, leaving the factory for a final "canter" before going north. By the way, these cars are doing very well indeed, and the "Geordies" certainly take to them with a vengeance. In fact, if we only had a few more Newcastles and Sunderlands we should very soon be far ahead of all the rest of the world in the production of cars, but unfortunately we English are a little too conservative, and hence we do not patronise a new movement sufficiently well to ensure its success in a comparatively short space of time, as other nations do; in fact, rather than help a new industry we do the other thing—which is not what may be termed a progressive policy. But there is one thing that may fairly be said, and that is that where we find we cannot *crush* a new industry it is then that we go for it hammer and tongs; and it is, I think, with the motor business just on the verge of the latter. At any rate, everyone is convinced that they must be in a position to make motors, and the public already are so greedy for them that the existing factories cannot supply in anything like reasonable time. The Daimler Co. were very busy too, and were despatching numerous cars from their works at the time of my call. One thing is certain, and that is that motors are not only well built in England nowadays, but they also have to undergo a very fair test before being handed over to their owners. The Progress Co., too, are very busy on motor-cars, and their new type of car has been running very well lately. The Raglan Co. are at work on motor-cars, and have, I understand, several motors on the point of being finished.

## What Is It?

THERE is at Coventry Station at the present time the most curious contrivance I have as yet seen, and which, the railway authorities have been instructed, is a motor-car. It resembles a sort of farm wagon on wheels with pneumatic tires, and wheels not much stronger than motor-tricycle wheels. Its engine is very rough, with a single cylinder and two fly-wheels, small in diameter but fairly heavy. On each side of the car is a system of fast and loose pulleys and belts, which give the two changes of speed, and the counter-shaft over the rear axle drives the latter by means of a single chain, the differential gear being placed on the rear driving axle. There is a handle for steering, and the oil and water tanks are placed in front of the car. There has been no attempt at painting or finishing, and no one seems to know anything about it, to whom it belongs, or who made it. In its present position it is neither an advertisement for the makers or the autocar industry generally, and no doubt some dark evening it will disappear.

## The Proposed Columbia Factory.

I LEARNT while in Coventry, on very good authority, that this scheme had fallen through. It will be remembered that some time ago it was reported the Columbia Manufacturing Co., an American firm, were opening a large works in Coventry, which were to cost close on £10,000, and at the time there was much talk about it; but it appears that, like a good many other American schemes, this has fallen to the ground, whether for want of a good motor to place on the market or for sufficient capital I cannot at the moment say.

## A Doctor's Car.

I some time since referred to Dr. Lupton's car at Stratford. This gentleman still finds his car a great saving, and it is now doing the work of three horses. He has been a car-owner now for some four months, and was overheard to say to another local doctor that had he known motor-cars were half so useful and enjoyable as he has found them, he would have been an owner the day the Act was passed, instead of wasting time and money in horseflesh when they (motors) were to be obtained. It does not want much practical testimony like this, surely, to convince a doubting public.

THE brothers Messrs. Sharpe, of Deptford, were met at Lowestoft the other day on their motor-tricycles, having ridden from town making only one stoppage on the way. They were on a fortnight's tour through the Eastern Counties, and intended the first day continuing their journey sixteen miles inland to Beccles.

SAYS *The Morning Advertiser*: "About nine o'clock Wednesday morning Mr. Stuart M'Iver, of Malcolm House, Rollo Street, W., was being driven in his own private motor-cab along the Costel Road, W., when another motor-cab, owned by Mr. Frank Batson, of 22 Florence Road, N.W., came at a high speed out of a side thoroughfare and crashed into Mr. M'Iver's vehicle upon the near side, knocking it completely over, the recoil sending Mr. Batson's cab back several yards and upsetting a coster's barrow laden with fruit. With the assistance of several passers-by Mr. M'Iver's cab was replaced upon its wheels, when that gentleman was found to be seriously cut about the face and arms by the broken glass. His coachman or driver, Henry Gander, of 2 Smythe Place, W., was also considerably hurt, but pluckily stuck to his post and drove his master to the nearest surgery, where both of them were attended to, Gander afterwards driving the vehicle, which was little damaged besides the broken windows, home, Mr. M'Iver preferring to ride in a hansom of the ordinary type."

## LE TOUR DE FRANCE.

### RESULT OF THE GREAT FRENCH CONTEST.

LAST week we gave some account of the start for the great French contest, and also an illustration of M. R. de Knyff's Panhard car on which, as will be seen from the results tabulated above, he won the race. M. de Knyff not only achieved the distinction, but his sportsmanlike conduct in picking up Williams, a motor-cyclist, who had fallen and was rendered insensible, received high eulogy from the President of the Automobile Club at Monday's dinner at Richmond. Of the nineteen starters in the car class only eight finished the seventh stage from the seaside resort of Cabourg to St. Germain. By the courtesy of the Committee and Secretary of the Automobile Club of Great Britain we are enabled to give a complete record of the distances covered each day and the times occupied by the competitors.

THE proposed contest of motor-carriages from New York to Irvington on the Hudson and return has been postponed until early in October.

THE Lander Transportation Co., Lander, Mont., are planning to introduce motor-omnibuses to carry passengers from Casper to Walton, Lander, Thermopolis, Meeteetsee, and the Yellowstone Park, U.S.A.

MR. ALEXANDER WINTON, of the Winton Motor-Carriage Co., Cleveland, O., has entered a protest against the proposed ordinance limiting the speed of motor-vehicles in that town to ten miles per hour.

M. HOSPITALIER, the well-known electrician, who was a visitor to the Motor-Car Exhibition at the Agricultural Hall, has suggested the use of the term "accumobile" for electrical automobiles, and this new word seems likely to become popular.

ASKED about a rumour that the General Electric Co. would engage soon in the manufacture of automobile vehicles at the works in Lynn, Mass., U.S.A., Professor Elihu Thomson is reported to have admitted that the Company was experimenting, but stated that it had not begun to manufacture, and that it was yet too early to make predictions.

THE *Electrical Review* thinks too much space has been wasted in considering as to what a car shall be called. Our contemporary thinks "electromobile" may be all right for some vehicles, but that "immobile" would be a more accurate definition for others; and when a motor car has come to a sudden standstill an even shorter word has been used.

## THE RAISING OF SPEED LIMIT.

THE following letter has been forwarded to motor-car manufacturers by the Secretary of the Automobile Club:—

DEAR SIRS,—Requests having been made to the Local Government Board that they would raise the limit of speed of automobile vehicles weighing unladen over 1½ tons, the Local Government Board has now requested the Automobile Club to undertake experiments for the information of the Inspectors of the Board as to the stopping-power of the vehicles in question on the flat and on hills.

The Committee feel sure that all firms engaged in the manufacture and sale of vehicles weighing over 1½ tons unladen will be anxious to assist the Club in its endeavours to place vehicles before the Local Government Board officials for these tests.

The Committee therefore express the hope that you may find it possible to send such vehicles as you may possess weighing unladen over 1½ tons, with drivers, and having on board the maximum load which they are designed to carry, to be present at these trials, which are to take place on Friday, August 11th.

It is hoped that you will kindly arrange for your vehicles to be at the top of the Petersham Hill, "Star and Garter" Hotel, Richmond, by 10.30 a.m. on that day.

May I ask that you will kindly let me have your reply at the earliest possible convenience, as, if you can send vehicles, I will transmit further particulars to you?

EFFORTS are being made at Moscow, Russia, to organize an automobile club in that city.

ON the occasion of the meeting of the French Association for the Advancement of Science in September next, it is proposed to organise a motor-car race between Paris and Boulogne-sur-Mer. The race will probably be run off on September 7th, the distance being 250 kilometres.

ALUMINIUM as a light metal for use on motor-cars is fast beginning to be recognised in the motor-car world, and there is no doubt that for steering pillar purposes, gear cases, etc., it has no equal. It is light and strong, and can be easily worked. Therefore, as lightness in motor-vehicles is a *sine qua non*, its use is to be commended.

As in this country, increasing attention is just now being devoted to electrical vehicles in France. To stimulate the movement the *Velo* has organised a race for electrical cars, and this is to be run off to-morrow (Saturday) in the neighbourhood of Paris, the distance to be covered being 52 kilometres (32½ miles). The race is divided into three categories: (1) vehicles weighing less than 800 kilogrammes, (2) vehicles weighing between 800 and 1,200 kilogrammes, and (3) vehicles weighing over 1,200 kilogrammes; one of the conditions being that no vehicle will be eligible for a prize unless the journey is made on one charge of the accumulators.

## MOTOR-CARS ON THE CONTINENT.

### The Accident to M. Serpollet.

ON Saturday evening last in the rue Bolivar, Paris, M. Léon Serpollet, accompanied by two friends, MM. L'Huillier and Doillet, met with a curious accident, as the automobile on which they were riding suddenly collapsed without the slightest warning. Happily neither of the three occupants of the vehicle received any very serious injuries, M. Doillet being the most unfortunate, as his leg was fractured. M. L'Huillier escaped with nothing worse than a black eye, while M. Serpollet himself expects to be on his feet again in a day or two. From the following account of an interview with M. Serpollet published by the *Velo* it would appear that there is more in the accident than would at first appear. M. Serpollet is reported to have said: "I told you yesterday that the automobile upset without the slightest warning. That was all I knew at the time. We were upset without knowing why. Nevertheless, the incomprehensible fashion in which the accident occurred kept

TWO VIEWS AT STARTING POINT ("LE TOUR DE FRANCE.")

worrying me, and I immediately suspected foul play. The matter was so serious that I did not dare to speak of it yesterday. I waited until the automobile had been examined. The car was inspected this morning, and it was discovered that the pins of the steering gear were missing. Had they been forgotten? Had they been taken out? I must tell you that the day before we had trouble with our workmen, and a certain number of them had been dismissed. I cannot affirm anything. In any case it is at least a curious coincidence. I now understand what happened. Going down the rue Bolivar one of the wheels must have turned sideways, causing the automobile to tip over." This is, we believe, the first accident which has happened to M. Serpollet, although his connection with automobiles has extended over some years.

### Race at Lyons.

ON Sunday, the 23rd instant, an automobile race took place at Lyons, over a distance of 100 kilometres. This course was organised by the Automobile Club, and resulted as follows: 1st, Schneider (carriage), time 1 h. 55 m.; 2nd, Deydier (carriage), time 2 h. 13 m.; 3rd, Marcel (carriage). The first of the motor-cyclists to finish was Miguot, who completed the distance in 2 h. 15 m. and figured fourth in the general category.

### Speed Estimates Again.

LET M. Jenatzy and his famous racing car "La Jamais Contente" look to their laurels, for a car—or rather it is only a small and apparently puny voiturette—has this week been discovered travelling along the boulevards of Paris at a speed exceeding 100 kilometres per hour! And this astounding discovery has been made by that most veracious of mortals, a policeman—so who dare doubt its accuracy? Subsequent proceedings may reveal the name of the maker, the horse-power of the motor, and other particulars pertaining to this remarkable vehicle, which was doubtless only kept out of "Le Tour de France" by its owner's kind consideration for the other cars. Truly England's intelligent guardians of the peace, even those of rural districts, will have some difficulty in beating this estimate of speed.

### Paris and St. Malo.

THIS automobile race has already received 77 entries, of which no less than 52 figure in the motor-cycle class. Among the competitors to date in the carriage category are such well-known racing men as Lemaitre, Girardot, Charron, Heath, Antony, Levegh, Broc, and Jenatzy. Doubtless many other names will be received before the

SNAPSHOT OF MOTOR-TRICYCLE EN ROUTE ("LE TOUR DE FRANCE.")

lists are finally closed, so that the race, in point of numbers at any rate, is an assured success. It will be observed that the four last names given above are those of competitors in "Le Tour de France" who drove Mors cars.

### The Exhaust Box on Motor-Cycles.

ENGLISH visitors to Paris cannot but be struck by the lack of consideration shown by motor-cyclists in opening the compression cock of their motors when driving in crowded streets. Frequently one sees, and hears, a motor-cycle travelling gaily along the boulevards, in the midst of dense traffic, and giving vent to a series of reports like a Maxim gun when in action. And this simply because the rider, with an absolute disregard of the sensibilities and the safety of the general public, has opened wide the compression cock of his engine, which loudly proclaims the fact. Another practice is also largely in vogue, and one which

the journal *La France Automobile* is seeking to suppress. It is the stupid custom among a certain section of motor-cyclists to so pierce their exhaust boxes that to all intents and purposes there is no box left, and the exhaust from the motor is discharged practically direct into the open air. Of course, the idea is that with the decreased back pressure thus obtained in the cylinder the motor runs better, but the greatly enhanced possibility of frightening horses, coupled with the increased prejudice excited in the public mind by the noise created by the motor should surely outweigh any slight increase of engine power which may be obtained by this objectionable method. In England the noise would not be tolerated, and it is to be hoped that the appeal of so powerful a journal as *La France Automobile* will do much to abate the nuisance in Paris.

#### Terrible Accident in Belgium.

THE many English friends of the well-known sportsman, M. Charles Craninckx, of Brussels, will learn with great regret of his very serious accident while competing in a motor-cycle race between Namur and Hastière on

Sunday, the 23rd inst. It appears that on the Waulsort Road M. Craninckx ran into a little girl, severely injuring her leg, and that in a violent effort to stop his machine he lost his balance and was thrown a considerable distance. A fractured skull was the result, and M. Craninckx, having been carried in an almost dying condition to Nagburcte Villa, underwent the dangerous operation of trepanning on Monday evening last. The operation was successfully performed by four doctors, and there is a faint hope that the unfortunate gentleman will ultimately recover.

#### An Incident at the Finish of Le Tour de France.

As M. René de Knyff, the winner of the big race, descended from his 16-h.p. Panhard at the Grille d'Hennemont, on Monday afternoon, he was immediately surrounded by numerous friends eager to congratulate him on his splendid victory. Foremost among these was M. A. de Lucenski, director of the *Journal des Sports*, who presented him with a handsome scarf pin in a case, bearing the following inscription: "To my friend René de Knyff, for his generous act of the 19th July, in the Tour de France.—A. de Lucenski." It will be remembered that when the motor-cyclist, Williams, came to grief on the Saint-Etienne Road, M. de Knyff stopped to rescue him—a truly generous and sportsmanlike act, and one which would enhance the popularity he already enjoys, were that possible.

#### Average Speeds.

IN "Le Tour de France" the average speed of M. de Knyff's car was 51 kilometres 233 m. per hour, while the tricycle ridden by Teste maintained an average rate of 41 kilometres 471 m. per hour; the total distance traversed being 2,291 kilometres.

#### The Renault Motor-Tricycle.

A good deal of attention is just now being centred in French automobile circles in a new motor-tricycle known as the Renault, particularly in view of the fast travelling that has been accomplished on it. The other evening the machine was subjected to a trial at the Parc des Princes track in Paris by M. Renault, when he succeeded in riding a distance of no less than 61 kilometres 797 metres (equal to 38.6 miles) within the hour, eclipsing all previous records, including Beconnais' wonderful ride. M. Renault's times were as follow:—

| Kilo.      | min. | sec.             | Kilo.        | min. | sec.             |
|------------|------|------------------|--------------|------|------------------|
| 1 .. .. .  | 1    | 10 $\frac{1}{2}$ | 40 .. .. .   | 38   | 31 $\frac{1}{2}$ |
| 5 .. .. .  | 4    | 57 $\frac{1}{2}$ | 50 .. .. .   | 48   | 24 $\frac{1}{2}$ |
| 10 .. .. . | 9    | 35 $\frac{1}{2}$ | 60 .. .. .   | 58   | 14 $\frac{1}{2}$ |
| 20 .. .. . | 19   | 7 $\frac{1}{2}$  | 61.797 .. .. | 60   |                  |
| 30 .. .. . | 28   | 45 $\frac{1}{2}$ |              |      |                  |

We hope to publish an illustrated description in an early issue of the Renault tricycle, which is fitted with a motor of no less than 3 $\frac{1}{2}$  h.p. We understand that negotiations are already in hand for the manufacture of the new machine in this country.

## CORRESPONDENCE.

### THE RECENT MOTOR-VEHICLE TRIALS.

TO THE EDITOR OF *The Motor-Car Journal*.

SIR,—Referring to the trials of heavy vehicles recently held at Uxbridge under the auspices of the Automobile Club, the figures appeal to all engineers and others interested in heavy traction, and I cannot abstain from commenting on the extraordinary economical results obtained with the Straker system lorry. According to the figures of the Automobile Club certificates attached to these vehicles, the cost of fuel on the Thornycroft lorry comes out at 0.29 pence per ton mile, while the cost on the Straker system lorry is 0.0914 pence per ton mile. This is a very great difference in the cost of working, as, for example, taking the average day's work of such a vehicle at 50 miles, or 15,000 miles per year, and assuming a load carried of 3 $\frac{1}{2}$  tons, the Straker lorry would cost for fuel £19 19s. 10d. for the year, as against £63 8s. 9d. for the Thornycroft lorry: showing a saving on the year's fuel bill of £43 8s. 11d. in favour of the Straker system.

This is an item which would strongly appeal to anybody using a heavy vehicle, and the results should call for high commendation from the judges of the Automobile Club, especially as the second trial ordered by them came out even better than the first.

I trust that you will consider these comments of sufficient interest for insertion in your next issue.

Thanking you in anticipation,  
435 Holloway Road, London, N.,  
July 24th, 1899.

Yours truly,  
ERNEST CLARE.

### A POPULAR WANT.

TO THE EDITOR OF *The Motor-Car Journal*.

SIR,—As a strong believer in the great future of motors, I think your Journal is supplying a public need. So far, however, I have been unable to ascertain from the mass of information it contains whether it is yet possible to buy a satisfactory conveyance at moderate figures. In an appreciative article on "Automobilism" in this month's *C.T.C. Gazette*, the writer rightly says "the public demand is for a light four-wheeled carriage to carry two persons on the one seat, with perhaps room for another elsewhere on occasion," or, I would add, in place of the occasional third, room for a few parcels. The public are too nervous to use petroleum spirit, and object to the smell of petroleum itself. Is it impracticable for the motor carriage to generate its own motive power in the shape of electricity? In the country districts it is impossible to travel when it is necessary to recharge accumulators.

The nearest approach to these general requirements that I have come across is an offer from an independent maker of a small petroleum car, suitable for two passengers and luggage for business or pleasure, mounted on four strong wheels, for £85 cash, with delivery in four to six weeks (?)

Axminster,

July 21st, 1899.

Yours truly,

A WOULD-BE MOTORIST.

### "HORSE OR COLT POWER."

TO THE EDITOR OF *The Motor-Car Journal*.

SIR,—The new De Dion motor so-called 2 $\frac{1}{2}$  h.p. has 70 mm. diameter cylinder, with 75 mm. stroke, and, like the Aster, which we believe was the first motor of its type described by its makers as 2 $\frac{1}{2}$  h.p., will not develop anything like that power. We write from actual tests made by ourselves, and not from hearsay. That being the case, it is just

as well that the public and those in the trade (who buy motors to make up into finished vehicles) should know that the majority of these so-called horse-powers are nominal, and, as far as our experience goes, invariably complimentary. We beg to advise you that the Dion-Dunlop motors manufactured by us, and fitted to complete tricycles by such firms as the Swift Cycle Co., the Ariel Cycle Co., and others, are of exactly the same dimension of cylinder and stroke, and *at least equal power*, as the very latest De Dions and Asters, and are of English workmanship and quality throughout. In future we shall designate our motors, to prevent confusion among the uninitiated, as  $2\frac{1}{4}$  h.p., though, as explained above, this does not accurately represent the brake horse-power it is possible to develop with such a size of air-cooled motor.

Yours faithfully

(For the Cycle Components Mfg. Co., Ltd.),  
Birmingham, CHAS. SANGSTER,  
July 21st, 1899. General Manager.

### THE NEW VOCABULARY.

TO THE EDITOR OF *The Motor-Car Journal*.

SIR,—It is evident that a new series of words is rendered absolutely necessary to convey meanings in connection with the new mode of progression by automatic power. May I be permitted to make a suggestion?

The absurd result of trying to coin a verb out of the words *auto-car* and *motor-car* is seen when *auto-caring* and *motor-caring* are written. The word *caring*, being the adjective of *care*, cannot properly be used as above; and it is the use of the above words which attracted my attention to the subject. The only way either word could possibly be used would be by placing the hyphen, instead of between the second and third syllables, between the two last, thus—*autocar-ing*, *motorcar-ing*. But what long words for use in this age of rapidity in everything! It is better to discard the word *car* altogether, as it is now connected with trams and railways.

The new words must be short, easy to use in a hurry, and capable of at once differentiating from words expressive of other modes of propulsion, such as horse conveyances, tram-cars, trains, etc.

Now, the three words we have as roots from which to coin our new vocabulary are the Greek *mao*, and the Latin *moveo* and *motune*—*autos* simply meaning *self*. The verb *automote* is at once suggested, but this is too long a word ever to come into general use; by dropping the *auto*, however, we have words at once short, concise and sufficiently differentiating for all practical purposes—to *mote*, *moting*, a *motor*, the *motist* or driver, and the *motor-engineer*.

I would suggest that, in order to fall in with the new vocabulary, the word *car* be omitted from the name of your excellent journal, and become "The Motor Journal."

East Moulsey, I am, yours truly,  
July 22nd, 1899. W. HARDWICHE, M.D.

[We are very much obliged to Dr. Hardwiche for his suggestion, but at present we may say that we do not propose to make any alteration in the title of our Journal.—ED.]

### INCREASED H.P. ON TRICYCLES.

TO THE EDITOR OF *The Motor-Car Journal*.

SIR,—With reference to the increased h.p. which all manufacturers of motor-cycles are giving their machines now, we should like to point out to you that long before the De Dions, Asters, etc., etc., who only now see the mistake of supplying a  $1\frac{1}{4}$ -h.p. machine, L. Barrière & Co. from the beginning never turned out any other but the 2-h.p. type. We must say that we find this absolutely sufficient, although it is only natural that firms have the desire to do better. With our 2-h.p. Barrière Sociable, to which we fitted a trailer, we have been able to mount a hill of 1 in 16 without pedalling, although the machine was loaded with

five men. On the other hand, we need only refer to the officially timed ascent of Petersham Hill, at the rate of fourteen miles an hour, to show that if a tricycle is really well built 2 h.p. is just the size required, and has the great advantage of being quite safe as regards heating. We should feel obliged if you could draw attention to these two points in the next issue of your valuable paper, and thanking you in anticipation,

We are, yours faithfully,

THE AUTOMOBILE ASSOCIATION, LTD.

Prince's Road, Holland Park Avenue,  
London, W., July 22nd, 1899.

### A CORRECTION.

TO THE EDITOR OF *The Motor-Car Journal*.

SIR,—We regret that through an error the address of "44, Berners Street, W." was printed at the foot of our advertisement in the catalogue of the Motor-Car Exhibition at the Agricultural Hall, which might lead to the assumption that we are proprietors of the business carried on there. We beg to say that Mr. J. Burns is sole proprietor of the motor-car business carried on at 44, Berners Street, W., and we have no other connection with the business other than that we have given Mr. Burns control of the sale of our motors in London and district.

Yours faithfully,

PENNINGTON & BAINES.

### MOTOR-CAR SERVICE FOR THE SUBURBS.

TO THE EDITOR OF *The Motor-Car Journal*.

SIR,—Suburban people are generally a decade behind provincials, and while all the towns of the country are getting their motor-car services I can hear of none in the London suburbs.

There should be a splendid profit for anyone running a service between Forest Gate and Snaresbrook, Forest Gate and East Ham, and Manor Park and Ilford. The roads are good, the 'bus connections antiquated, and the people are waiting for improvements.

Yours truly,  
Woodgrange Road, Forest Gate,  
July 24th, 1899.

A.B.C.

### TUBING v. ANGLE STEEL FOR MOTOR-VEHICLES.\*

THE fact that a firm, which has done much pioneer work in the development of high grade tubing, does not use tubing exclusively for all its motor-vehicle frame work, provokes some inquiry as to the relative advantages of the tube and rolled steel of other varieties of cross section. It is not so much a question of material, because steel of a grade suitable for tubing is as readily rolled into other shapes, and the several heatings required for the drawbench operations of the one process are probably no more injurious to the quality than the rigor of the rolling treatment. Nor is it likely, for several reasons, a matter of economy as regards the lengths of tubing or angle steel. About the same quantity of both would be used for a frame of like dimensions and the cheapness of the one would be offset by the decreased weight of the tubing.

To my view the all-important difference between the two lies in the ease with which the flat surfaces of the rolled sections lend themselves to shop manipulation and design. For example, one need but consider how unhandy a tube really is when an attempt is made to construct a fastening with another piece, which is to be removed occasionally. The tube may be reinforced internally or externally by another tube or a wooden core, and the piece to be attached by a suitable clip and a distance piece fitting the adjacent surfaces. This connection will be satisfactory under circumstances in which

\* By Robert I. Clegg, in *The Horseless Age*.

rotation around the tube is otherwise provided against. An example of the opposite character is to be seen in the lower ends of the front forks of a bicycle where the difficulty is met by flattening the tube to get the required surface against which to bolt the spindle. This inconvenience in using the bolts, screws and rivets of modern shop practice would be of little moment where the several parts are as few in number as the bicycle demands, but the case is altogether different in the motor-vehicles.

Improvements are being made in brazed joints. The original heavy forgings which were slowly and expensively machined inside and out to the requisite lightness gave way to stampings cut and drawn up out of sheet steel. One maker, if not more, has adopted cast steel for this purpose, and granting due skill in the art of brazing, the tubular frame is as strong and serviceable as it is agreeable to the eye. Unfortunately, the strength of a tube deteriorates rapidly with but a slight injury to the wall. A dent or cut with the corner of a file when the excess borax or spelter is being removed will greatly impair the original resistance. The sand blast is preferable to the file for this very reason, but the readiness of the other accounts for its more common adoption. The injuries alluded to are easily concealed by the enamel and are not readily detected prior to an accident. Where enough of this class of brazing is done, as in a bicycle factory, system and oversight will avoid weakness in this detail, but those who have little of this work to do must therefore exercise the greater vigilance.

Angle steel is readily bent and bolted and affords a good foundation for brackets and bearings. Where a number of bends of equal dimensions are required, a steel, or even an iron, die may be cast of the desired curvature. On bending the angle steel around the die—the steel being heated, of course—the two webs will diverge from the former right angle. This can be hammered with a flat swage down to the surface of the die whilst the one web is clamped firmly in place. If the strength of a section of angle iron or steel is calculated from a rectangular form it should not be overlooked that the first has from 2,200 to 4,500 pounds less tensile strength than the latter.

So far as a comparison of the tube and the solid rod is of importance, the following is taken from a table published by the manufacturers of Pioneer tubing; a tube having an external diameter of one inch and having a thickness of wall—or gauge—of one-tenth of an inch is equal in transverse strength to a solid rod .837 in. in diameter. There is a common belief that steel for frames should be of a very mild, soft nature. During the last few years a better knowledge of the endurance of metals has been obtained from the experiments to determine more accurately the condition to which the term fatigue is applied, and harder and stronger steel is now substituted.

Steel of this type will stand a long-continued series of slight bends prior to failure. For example, a 24-in. length of tube is said to have been subjected to  $\frac{1}{4}$ -in. vibrations at the rate of 300 a minute night and day for a month, at the end of which time the tube was reported as showing no signs of crystallization or fracture. A tube of  $1\frac{1}{8}$  by No. 22 gauge broke under a tensile strain of 10,175 lb., and a tube of the same quality and size has stood a strain of 6,000 lb. under endwise compression. These figures are decidedly better than, I fear, much of the common makes of tubing would sustain, and are only here given as an indication of the high grade this branch of engineering has attained.

We learn that the Leicester Motor-Car Co., Ltd., has, through H. A. Clarke & Co. of 31 Rutland Street, Leicester, just started running a fourth Daimler car. The "body" of this vehicle, which is a panelled wagonette, has been built by a local coach-builder, and is handsomely upholstered. This car will, we understand, be kept exclusively for private parties.

THE Norddeutsche Automobilwerke is the style of a new concern which has just been formed at Papenburg, Germany, to construct motor-vehicles.

THE New Haven Carriage Co., New Haven, Conn., recently shipped five electrical carriages to the Paris branch of the Cleveland Machine Screw Co.

THE Baldwin Cycle Chain Co., Worcester, Mass., are now prepared to furnish motor-car chains of  $1\frac{1}{8}$  in. pitch, and having space for tooth  $\frac{3}{8}$  by  $\frac{1}{2}$  of an inch.

FOR the first time in the United States a motor-wagon is now being used in collecting the mails. The place where the trial is being made is Buffalo, New York.

MESSRS. FRISWELL, LTD., write us they have opened a dépôt at 6 The Pavement, Chiswick, where a supply of petrol, lubricating grease, etc., can be obtained.

WE learn that Mr. R. W. Robinson, of York Road, West Hartlepool, is filling a want in his district by arranging to hold a stock of petrol and other motor-vehicle accessories.

THE United States Post Office Department at Washington is reported to be considering a proposition to equip the mail-collection wagons in use in that city with electricity.

IN connection with our enjoyable trip to Henley, an unfortunate printers' error occurred. We alluded to Mr. and Mrs. Longhurst. It should have been Mr. and Miss Songhurst, the former being the genial secretary of the Liquid Fuel Engineering Company.

IN referring to the McLachlan heavy-oil motor-car on July 14th we stated that the weight of the vehicle shown at the Agricultural Hall Exhibition was  $7\frac{1}{2}$  cwt. Mr. MacLachlan, however, writes to say that the weight of the little car is only  $3\frac{1}{2}$  cwt.

THE Comet Cycle Co., of High Street, Wandsworth, S.W., is, we learn, now providing for the wants of automobilists by carrying a stock of petrol and other motor-car accessories. The Company, having its own engine and dynamo, can also undertake the recharging of small batteries.

AN accident took place at Newcastle-on-Tyne on Sunday night. A motor-car left Gosforth soon after seven o'clock for Newcastle, and on reaching the Blue House one of the wheels broke and the car was pitched on its side. There were eight persons in the car at the time, and Mr. Patrick Fox, of 15 Lord Street, was rather seriously injured. His wrist was hurt, his right leg and other parts of his body were bruised. He was attended by Dr. Dixon, of Ellison Place, and also afterwards at the infirmary. The conductor of the motor-car was also slightly injured.

AT the Liverpool Police-Court, Maurice Gildard was summoned for recklessly driving a motor-car on three informations in such a manner as to endanger the safety of pedestrians. Mr. Cripps prosecuted. The evidence given in the cases showed that the defendant, between 15 and 16 years of age, in the employ of a motor-car company, recklessly and furiously drove one of their vehicles in Aigburth Vale and Lark Lane on recent dates. It was stated that he had been previously fined for a similar offence, and he was now ordered to pay a penalty of 20s. and costs on each of the three informations.

AT the West London Police Court, Albert Brickwell has been fined 3s. and 2s. costs for an obstruction which he was alleged to have caused in the High Street, Kensington, with a motor-car of which he was in charge. The case was heard on Saturday. It appeared that on June 24th he was driving the car, and stopped outside a chemist's shop in the High Street to get some paraffin. While engaged in the search, two of the passengers obtained some from a neighbouring hotel, to the front of which he drove. While they were in the hotel having refreshment a police-constable came along, declared that the vehicle created an obstruction, and summoned the driver, with the result just stated.

## POLICE PERSECUTION OF AUTOMOBILISTS.

It would appear from a case heard at Slough on Wednesday last that the police are laying traps to secure conviction of automobilists for contravention of regulations made by the Local Government Board before that Board had any experience of automobiles, and which, it has become apparent, cannot in many cases be followed without damage to all concerned.

The local police at Slough appear to have discovered a regulation which requires an automobilist to stop his vehicle if a police-constable, or a person in charge of a restive horse, holds up his hand.

They summoned Mr. Lyons Sampson, a well-known engineer and a member of the Automobile Club, for having failed to stop his vehicle in Colnbrook; and the case was heard before a full bench of magistrates, including Captain Higgins, Mr. Hartrop-Nash, General Little, Sir Charles Piggott, Mr. Freeman, Q.C., and others.

Mr. Staplee Firth—a solicitor and a member of the Automobile Club—defended Mr. Sampson, who was kept standing for upwards of two hours in a crowded court-house during the hearing of the case.

The case was watched on behalf of the Automobile Club by the Secretary, as the regulation is one which, if upheld for trivial causes, might permit of every tradesman's boy in charge of a horse stopping every automobile he might meet.

Mr. Lyons Sampson's evidence was to the effect that when running through Colnbrook at five to six miles an hour—a speed which was admitted by the police—a man leading a quiet horse which was being driven by a man in a trap held up his hand when Mr. Sampson's car was within fifteen yards of him. Mr. Sampson slowed down and took steps to stop his car within the shortest possible distance without causing noise. By this time the cart had passed, and Mr. Sampson, seeing that the horse was quiet, kept going ahead, but was stopped fifty-six yards further on by a police-sergeant, who asked him why he had not stopped, and took his name and address.

Mr. Staplee Firth, who carried out the defence in the most spirited manner, at the outset upset the case by drawing an admission from the driver of the carriage that he had not held up his hand. The driver was specifically asked this question, and emphatically stated that he had not. But since, from the wording of the summons, this admission would have put an end to the case, the magistrates, who showed unmistakable prejudice, recalled the driver. The driver, on being re-questioned, said he did not remember having lifted his hand, and that he had both hands on the horse's reins. Mr. Firth then claimed that the charge should be dismissed; but the Bench, to the surprise of everyone, ruled that the driver had held up his hand.

Mr. Firth then elicited that the man who was at the horse's head was a constable in plain clothes, who had been conversing with the driver of the cart for three-quarters of an hour, during which time the cart had been stationary.

Mr. Firth, to the evident horror of the Bench, then asked questions to prove that this plain-clothes constable (P.C. Young) and the sergeant (Gascoigne) had been instructed to set a "trap" for the first automobilist who might come along.

Mr. Firth: Why were you in plain clothes?

The Police-Constable refused to answer. The Superintendent of Police pleaded privilege, and the Bench upheld the plea.

Mr. Firth: Why were you waiting with the driver of the cart for three-quarters of an hour?

The P.C. would not answer. The Superintendent protested; and the Bench held again that no answer need be given.

Mr. Firth: I put it to you that you were there for the purpose of leading the horse and stopping the first motor-car that came along.

Police-Constable: I refer you to my Superintendent. I refuse to answer you. I was there by the orders of my Superintendent.

The Bench ruled that it was unnecessary for the witness to give a further answer to this question.

Mr. Firth (to Sergt. Gascoigne): Had you special instructions to look out for motor-cars?

Sergt. Gascoigne: I decline to answer.

Mr. Firth: Is not this a trumped-up charge got up by the police?

The Chairman: You need not answer that question.

Mr. Firth protested against the chairman answering for the witness, as it was for the witness to make the objection.

Mr. Firth: Where were you on duty?

Sergt. G.: In the High Street.

Mr. Firth: Where?

Sergt. G.: For about twenty minutes before Mr. Sampson came I was in a butcher's shop.

Mr. Firth: Had you any instructions in connection with Police-Constable Young?

Sergt. G.: I refuse to answer.

The Bench upheld his refusal.

Mr. Firth: Were you not waiting for a motor-car?

The Sergeant refused to answer.

Mr. Firth: Did you give a written report on the matter to your Superintendent?

Sergt. G.: Yes.

Mr. Firth: I call for it.

Superintendent of Police: I decline to produce it.

The Bench upheld the Superintendent.

Mr. Firth: In what way do you receive instructions concerning motor-cars?

Sergeant: Sometimes in writing and sometimes verbally.

Mr. Firth: How did you receive your instructions on this occasion?

The witness refused to answer.

Mr. Firth: Were you not put there to trap motor-cars?

The Superintendent objected to this question, and the Sergeant answered that he was there to "trap all breakers of the law."

During the course of a speech for the defence, Mr. Firth argued that if the constable in plain clothes was the only person who held up his hand he was not a police-constable within the meaning of the Local Government Board Regulations.

Mr. Freeman, Q.C., one of the Bench, asked whether Mr. Firth could quote any precedent for this opinion.

Mr. Firth commenced to quote the parallel case of a man in plain clothes in London attempting to control the traffic; but the Bench at this point said the case was immaterial—and in spite of evidence to the contrary they ruled that the driver had held up his hand.

One amusing incident in the case was when Mr. Firth in his argument asked the Bench whether the regulations would cover the case of a policeman in plain clothes who might simulate drunkenness and stand in front of a vehicle with his hand up, and if in such case an automobilist might be prosecuted for failing to stop his car. The Superintendent of Police, who was conducting the case, exclaimed: "Most certainly a motor-car is bound to give way to everything"; but on being challenged by Mr. Firth as to his statement he carried it further by saying: "If you will let me know when you are coming on your car I will put the drunken policeman there and if you do not stop your car I will prosecute!" On Mr. Firth challenging the accuracy of his interpretation of the law that "a motor-car must give way to everything," the Superintendent proceeded to refer to a copy of the law, but apparently found in it no regulation to the effect stated by him, and subsided into silence!

After a powerful speech for the defence by Mr. Firth, Mr. Lyons Sampson was called and examined; and after his cross-examination had ended Mr. Firth called upon Mr. C. Johnson (the secretary of the Automobile Club) to speak as to certain points which had arisen in the case, and also to the fact that Mr. Sampson was a well-known, and a cautious, driver, and a gentleman who preferred to uphold the law rather than infringe it in the least degree.

At this juncture there was a hurried discussion amongst the Bench, who apparently realised that if their decision resulted in the conviction of Mr. Lyons Sampson the matter would be taken to a higher court, where the arguments would be thoroughly threshed out.

Addressing Mr. Firth, they then announced that they dismissed the case.

Mr. Firth thereupon applied for the costs, which should have been granted in the ordinary course, but they were refused.

Mr. Sampson has thus been put to considerable expense and loss of time, and has had the indignity thrust upon him of having to stand (although a request was made that he might be seated) in a police-court during a protracted hearing, owing to an apparently systematic attempt by the local police to entrap him.

As it appears to be the intention of a great many prejudiced people in authority to use the law as an engine of persecution against automobilists, the Committee of the Automobile Club should consider as to taking vigorous steps to protect lovers of the sport.

## TO CORRESPONDENTS.

All communications intended for insertion in this Journal or relating to Editorial matters should be addressed to THE EDITORIAL DEPARTMENT, MOTOR-CAR JOURNAL, 39 and 40 Shoe Lane, London, E.C. Letters must in all cases be accompanied by the name and address of the writer, as no notice will be taken of anonymous communications.

The Editors cannot undertake to return MSS. or drawings, although every effort will be made to do so in the case of rejected communications. Where such are regarded as of value, correspondents are requested to retain copies.

The Editors do not hold themselves responsible for the opinions expressed by their correspondents, or for statements and facts which do not appear in the editorial columns.

The Editors and Publishers beg also to state that they will accept no responsibility for unsolicited contributions, even if used, unless payment for same is directly specified in forwarding, and the terms arranged before publication.

To insure insertion communications and contributions must be in the Editor's hands by Wednesday forenoon of the week in which the same are intended to appear. Disappointment may be caused by non-compliance with this rule, and to avoid this earlier receipt, if possible, is necessary.

# THE Motor-Car Journal.

Vol. I.]

LONDON, FRIDAY, AUGUST 4th, 1899.

[No. 22.]

Published Weekly by CORDINGLEY & CO., 39 & 40 Shoe Lane, London, E.C.

## COMMENTS.

### More Motor Etymology.

ETYMOLOGISTS in various parts of the world are still puzzling their heads as to suitable terms for motor-cars of different types. Some weeks ago we published a long letter on the subject from Mr. Arthur Shippey. This has apparently been read with interest, although not with approval, by an automobilist in the United States, for in the columns of one of our American contemporaries he asks: "Why not call the motor-vehicle a 'trol' (pronounce short, like 'hot,' 'pot'), riding in a trol, 'trolling,' the trol driver, 'troler,' and if a gentleman trols for sport he is a 'trolleur' (pronounce French). In order to specify the motive power of a trol, simply use electrol, gasotrol or gastrol, petrol, naphtrol, steamtrol, etc. To describe the shape of the vehicle, trolbuggy, perhaps, abbreviated to troggy, trolomnibus to trolibus, trolbuss, trolsully to trolky. This would generate 'electrolibus' for 'electrically-driven omnibus' or 'petroletor' for a 'motor-phaeton driven by petroleum.' But in average conversation the indication of the motive power would be omitted. Finally, the tricycle could be called—borrowing from the French—'trolley,' which would form petrolette, electrolette, whilst the motor-bicycle would become trolbyke or trolbike." Although we print the suggestions as to the new terms, we do not consider they are likely to meet with adoption, as some of the suggested names—as, for instance, "troggy" (!)—are of anything but an inviting character.

### A Motor Competition.

FOR some time past there has been a growing feeling of suspicion in French automobile circles that certain builders of petroleum-spirit motors have been exaggerating somewhat the horse-power capacity of their engines. Of course there are many mechanical automobilists who are able to check for themselves that their motor actually develops the horse power claimed by the maker, but, on the other hand, there are many others who are not in this fortunate position, and it is suggested that while having a motor-vehicle fitted with a motor rated at, say, 6 h.p. they are not getting out of it more than 4 h.p. Our French contemporary, *La Locomotion Automobile*, is now endeavouring to assist owners of motor-cars by organising what it terms *Le Concours de Moteurs*. The motors entered are to be subjected to a series of brake tests under the inspection of a competent jury. Each motor will be tested three different times under the most favourable conditions of carburation and ignition. The results obtained are to be published, together with the name of the builder, the rated horse power, the diameter of cylinder, the stroke, the type of ignition and carburettor, the number of revolutions, diameter of fly-wheels, weight, etc. The competition is open for both builders of motors and also owners of motor-cars, the latter thus having an opportunity of ascertaining whether the engines in their vehicles are capable of developing the power guaranteed by the makers.

### A Heilmann Motor-Car.

THE name of M. Heilmann is well known in electrical engineering circles as the designer and builder of the novel electrical locomotives in use on the Western Railway of France. M. Heilmann has, it appears, lately been devoting his attention to automobiles, and has just completed a new type of motor *avant-train*. The latter is provided with four wheels, and carries the whole of the motor and transmission gear, so that it may be attached to any type of vehicle. We hope to give a description of the new arrangement in an early issue.

### The Pope and Motor-Cars.

OUR French contemporaries to hand this week all contain a paragraph to the effect that the Pope has placed an order with a French firm for an electrical vehicle. Later accounts, however, show that the statement is not quite correct. It appears that a French motor-car concern has made his Holiness a present of a motor-vehicle, which has been accepted, but is not being used by the Pope himself. As a matter of fact the Pope has discontinued his carriage drives, and now only goes about in his carrying-chair.

### Motor-Car Accidents in France.

So many motor-car accidents have lately been chronicled in France—a few of which have unfortunately been true, while the remainder were largely the imagination of the daily press reporters—that the question was discussed at the last meeting of the Committee of the French Automobile Club. On the proposal of the *Compte de Chasseloup-Laubat*, seconded by M. Forestier, it was resolved that immediately the news of an automobile accident is received an engineer shall be despatched to the scene to enquire into the cause and prepare an official report thereon.

### Another Growl from the Stables.

WE referred last week to the somewhat alarmist position the *Stable and Kennel* has taken up in regard to motor-vehicles. The remarks of the Editor of our contemporary are, however, mild in comparison with those of a correspondent to his journal, who styles himself "Constant Reader." The latter gentleman cannot comprehend "why the legislature sanctioned the present dangerously high rate of speed, and in the second place why motors have been permitted to travel on country roads and lanes at all"! This selfish gentleman, who would appear to think that owners of horses are entitled to a monopoly of the roads, goes on to remark that "a horse of high mettle meeting a motor suddenly on a country road can hardly be persuaded to face the noisy, evil-smelling thing. To whip round in an instant and then bolt is what inevitably has to be faced by riders." Comment on such empty arguments against motor-vehicles is quite unnecessary. We will only suggest to "Constant Reader"

that ere long he will probably change his opinion. When he has become an enthusiastic automobilist he may be tempted to ask "Why hay-motors should be allowed on country roads and lanes at all?" For ourselves we will not go so far as this; unlike the correspondent above alluded to, who wants to monopolise the public roads for his horses, we believe that there is a useful sphere for both hay and auto-motors.

#### Motors for Medical Men.

THIS is the title of several letters which have lately appeared in the *British Medical Journal*. The last communication on the subject is a somewhat contradictory one, for while at the beginning the correspondent remarks, "and I would strongly urge any one having a horse and carriage not to dispose of them and buy a car," he concludes as follows: "It (a motor-car) is much more interesting than a horse-driver would think, and, taking everything into consideration, I think it suits me better than a horse." There can be no doubt of the suitability of motor-vehicles for medical men. Already quite a number of doctors are making their rounds of calls, particularly in country districts, either in motor-cars or on motor-tricycles, and when their advantages become better known we have not the least doubt that the members of the medical profession will become good customers to builders of such vehicles.

#### Motor-Cars at Newcastle.

THE tramway question at Newcastle to which we referred last week is developing, and the *Newcastle Daily Chronicle*, in the course of a long and spirited leading article, says: "We do not want wires of any sort, overhead or underground. What we do want is decent roads, which it is the duty—the scandalously neglected duty—of the Corporation to provide. The rest may safely be left to private enterprise, the motor-car, and competition. According to the municipalisers, they object to a monopoly being worked for private advantage. Very well, then; let the monopoly be abolished. The motor-car is no monopoly. It cannot become one. It is every day growing in popularity by reason of its speed, its comfort, its safety and its humanity. The motor-car is the very vehicle for whom the public have been waiting; and the only regret uttered in its regard is that the cars are not yet running up Westgate Hill. They will be soon, for the acclivity presents no obstacle, and the cars have been ordered. There can be no doubt whatever in the mind of any reasonable person, willing to accept the result of experiment, that the automobile, needing neither wires nor rails, free to choose its own track and to travel in any direction, able to cover the ground quickly, and offering no impediment to the general traffic, is destined to furnish the omnibus of the future. Indeed, it has already furnished us with the ideal omnibus."

#### A New Motor-Car Tire.

IN order to overcome as much as possible the tendency of pneumatic tires to roll on the rim, a new tire for motor-cars has lately been designed by Mr. J. Jelley, of Tires, Limited, Coventry. A feature of the new tire is the width of the base, giving, with the depth of the side flanges, great stability where the tire is attached to the rim. The attachment is by means of zig-zag wires embedded in flat flaps on the cover edges, and which overlap each other in the bed of the rim in the same manner as in the "Vitesse" cycle tire. The action of pumping up the tire causes these flaps to be firmly pressed together in the rim, holding the cover on to the rim. The corrugated wires, of which the flat flaps are composed, render them elastic, and the pressure of the air on the canvas between the corrugations causes their circumference to be reduced, thus firmly gripping the rim. The

tire is, in addition, held on with bolts, which pass through the flaps, and are secured by nuts on the outside of the rim. For a 30-in. tire four of these bolts are used. Even without them there is, it is claimed, no chance of the tire coming off the rim, they being fitted merely as a help to the tire on the driving wheels. The tire has a thick rubber tread of from 3-16 in. to 1/4 in., exclusive of the strong canvas and insertion. The tube being entirely enveloped by the cover and its edges, the tire can be taken off the wheel without removing the inner tube from it, and a new tire sprung bodily on to the rim, the old one being repaired away from the wheel.

#### Motor-Cars at Dover.

IN connection with the motor-car show which is to be held at Dover next month, applications were made on Tuesday to the local council to license some motor-victorias, omnibuses and *chars-a-bancs* to ply for hire during the week of the exhibition. We regret to learn that the applications were refused, the reason advanced for the refusal being that the vehicles would compete with local conveyances. Dover has lately been so much to the front in motor matters—the coming exhibition being largely due to the Mayor of the town—that it is to be regretted the local council in its wisdom should have marred the progress of the automobile in the district by refusing the application for licences above referred to.

#### Tests for British Makers.

EVERYWHERE it is acknowledged that the displays of the reliability of the automobile to which the people of the Continent have become accustomed have had much to do with the popularity of the motor-car in Europe. While not favourable to wild and reckless racing, it is becoming recognised by English automobilists that trials of efficiency will have to be more frequent in this country in the interests of the industry, and we understand a proposal is now before the Automobile Club of Great Britain for a contest on the western route to Edinburgh from London. The vehicles would have to arrive at their destination within time limits previously imposed, and the idea is that the times taken in ascending certain hills would be added together, and on those speeds the awards would be made. It is to be hoped that English manufacturers will respond to any appeal that may be made for entries, and the presence of a few foreign cars would give a zest to the proceedings.

#### Forthcoming Contests.

MEANWHILE several important contests have been arranged, and a race *via* Dunkirk will take place between Paris and Ostend on September 1st. There will also be a touring class starting on the 31st prox., to reach Ostend about the same time as the racing cars and travelling 90 miles each day. This is a contest in which English automobilists should enter, and Mr. C. Johnson, the Secretary of the Automobile Club, will be glad to hear from intending competitors. The race from Paris to Boulogne, which is expected to finish on September 17th, is arousing considerable interest, and two electric charging stations will be provided on the route, so that entries of electrical vehicles are anticipated. In connection with this the Automobile Club of Great Britain will probably organize a club tour to Dover, and subsequently a trip to Boulogne; whilst an exchange visit from French confreres is anticipated.

#### The Richmond Show.

WITH reference to our comment on the Richmond Show in last week's issue of *The Motor-Car Journal*, we are informed that a complete balance-sheet will be published for the information of guarantors as soon as possible.

### Sir David Salomons and the Auto- mobile Club's Policy.

We are glad to have an assurance from Sir David Salomons that our interpretation of his remarks at the Automobile Club's Richmond dinner was rather beyond his meaning. He recognises that local enterprises are justifiable and desirable, but unfortunately is of opinion that members of the Automobile Club should not be invited to contribute to the finances of such efforts unless they happen to reside in the districts where they take place. That is exactly where our difference with the views of Sir David exists. In the present state of the industry every effort to secure attention to the utility and reliability of automobiles is to be encouraged, and whether it be made by the Automobile Club in London or its active affiliated branch in Liverpool is a matter of little concern, so long as it results in general benefit to the industry. The country is so large and the work to be done is so great that there is plenty of room for energetic associations in each district, and while they are affiliated with the Automobile Club we see no fear of rival organizations being called into existence. Everybody recognises the heartiness with which Sir David Salomons has thrown in his lot with the institution in Whitehall Court, but we hope he will not discontinue his assistance to all local efforts to popularise the motor-car. For, as we have said, there is plenty of work yet to be done in making known the commercial efficiency of the new method of locomotion.

### The Liverpool Trials.

DURING the last few days Liverpool has again been the scene of important trials in connection with motor-vehicles, and those who were present last year as well as on the present occasion could not fail to have been struck with the great improvement in the vehicles taking part in the extremely arduous tests the Liverpool Self-Propelled Traffic Association subjected them to. The judges and observers started work last Friday measuring and weighing the six vehicles which had put in an appearance. On Monday, the hill-climbing tests were held, and, as will be seen by the diagrams published in another part of the present issue, these were of a most severe nature. Tuesday and Wednesday were devoted to runs respectively to Widnes and Rainford and back—distances of about 35 miles. All the vehicles did splendidly and are of commercial efficiency, and fit to be put on the market. The latest Thornycroft, that with the trailer, did remarkably well, and the pattern, we understand, is to be their standard of the future. Its pace uphill was certainly very notable. The Coulthard did not start in the third day's trials, owing to a slight mishap, but the Clarkson-Capel, with a lightened load, went through very well, the observers on that and other cars strictly keeping the drivers within the five-mile limit.

## THE KÜHLSTEIN-VOLLMER MOTOR-TRACTOR.

IN a recent issue we gave an illustration together with a few brief particulars of the Kühlstein-Vollmer motor-tractor as applied to a cab, which is made by the Kühlstein Wagenbau Gesellschaft of Charlottenburg, Berlin, and which is being introduced into this country by the Automobile Association, of Prince's Road, Holland Park Avenue, London, W. We are now able to publish several illustrations of the details of this type of vehicle. The motor and the whole of the driving gear is arranged in a rectangular box *K* (Figs. 1 and 2) situated above the middle of the front axle, the top plate of the box *K* being suspended from the pivot plate *P*, by means of bolts. The top plate *P*, which forms a rigid whole with the engine box *K*, carries a toothed crown *Z*, provided with internal teeth, which are connected with the hollow pivot *S*, also arranged thereon. This pivot is rotatably mounted on the hub *N* of the pivot plate *P* above which is screwed upon it the nut *m*.

Under the plate *P*, is rigidly fixed the steering rod *L* with its hand wheel *R*, the rod terminating in toothed gearing meshing with the toothed crown *Z* of the engine box cover *P*. For the purpose of diminishing friction, rollers *r* moving upon the bearing parts of the plate *P* are arranged on the circumference of the toothed crown.

The differential gear *D*, which is mounted directly upon the axle *a* and at one end of the same to economise space, is situated directly between the two lengths *a* and *b* of the axle; in order that the latter may form a rigid whole, the shorter length *a* is inserted within the longer *b*. By this means the axle bearing *C* is, it is claimed, relieved from cross strain, whilst the provision of an intermediate bearing for the lengths of axle *a* and *b* is rendered unnecessary. In order that both the springs *F* may support an equal load upon the two bearings *C*, driving is effected by means of the chain wheels *k*<sup>1</sup>, *k*<sup>2</sup>, and in such a manner that both of them act simul-

FIG. 1.

taneously upon the bevel pinions of the differential gear, this being effected by means of a sleeve *c*, through which is passed the length of axle *b*. The axle bearings *C* are made in two parts, thus enabling the lengths of axle to be inserted. The upper halves of the bearings *C*, which form a strap or staple, are directly connected with two springs *F*, by which the entire engine box and fore part of the vehicle are carried. The lower halves of the bearings are connected by means of a bent shaft *E*, which imparts to them the necessary stability and maintains the distance between them constant in the transverse direction. Lubrication is ensured by means of the annular lubricators *o*.

The motor is of the horizontal, double-cylinder, petroleum-spirit type, capable of working up to 6 h.p. It is arranged on the left part of the space *R* (Fig. 2). The ignition is electrical. Two speeds are provided, the transmission being by means of belts, which normally run slack, but tightened as desired by jockey pulleys, carried, together with the operating levers *H*, *H*<sub>1</sub>, upon the top plate *P* of the engine box.

Through this plate  $P$ , at the point where it is pivoted, passes the hollow pivot or pin  $S$ , which extends into the pivot plate  $P_1$  at its centre, in such a way that during turning of the fore-carriage it is capable of angular displacement with respect to the plate  $P$ . Within the pin or pivot  $S$  are arranged the upright tubes  $e^1 e^2$  serving to regulate the motive power. The object of this arrangement is that when the top plate  $P$  rotates the vertical tubes may rotate with it. By this means the transmission of the regulating action upon the under frame, which is itself turning, is rendered possible in a simple manner, whilst the position of the fore-carriage with respect to the vehicle is indicated to the driver.

The vertical tube  $e^1$  is rigidly connected with the operating lever  $H_1$ , and the outer tube  $e^2$  with the lever  $H_2$ , both these tubes being encased in the outer tube or sleeve  $e$ , which latter is rigidly fixed in the pivot  $S$  of the top plate  $P$

FIG. 2.

of the engine-box and at its upper portion carries the locking discs of the operating levers. The lower extremities of the tubes  $e^1 e^2$  are connected with the bevel pinions  $r^1 r^2$ , thereby enabling the shafts  $v^1$  and  $v^2$  journaled in the top plate  $P$  to be rotated by turning one of the operating levers  $H_1 H_2$  in a right or left-handed direction. The object of this arrangement is that a pair of tension pulleys  $S_1 S_2$  may be so operated that one of them only ( $S_1$  for example) tightens the belt, giving the desired transmission ratio, whilst the other tension pulley  $S_2$  remains motionless. The operation and arrangement of the tension pulley gear is illustrated in Figs. 3, 4, 5, and 6, in which a pair of tension pulleys  $S_1 S_2$  arranged upon the shaft  $v_1$ , are shown in various positions. In Figs. 3 and 4 the two tension pulleys  $S_1 S_2$  which are arranged upon levers pivoted upon opposite points  $n^1 n^2$  upon the top plate  $P$  are shown disengaged—that is to say, in both cases the toothed pinions  $z^1 z^2$  mounted upon the shaft  $v_1$  are out of engagement with the toothed segments  $u$  of the tension pulley levers. In addition to this lever the lower teeth  $i$  of the toothed segments  $u$  are raised a certain distance above

the points of the teeth of the segments  $z^1 z^2$ , because the noses  $x$  upon the tension pulley levers rest upon the concentric portion of the cam-shaped hubs  $y$  of the toothed pinions  $z^1 z^2$ .

If the shaft  $v^1$  is caused to rotate in a left-hand direction (for example) by means of the hand lever  $H_1$  (Figs. 1

FIGS. 3 AND 4.

and 2) the nose  $x$  of the tension pulley  $S_2$  falls along the reduced cam-shaped portion of the toothed wheel hub  $y$  and the tooth  $i$  gears with  $z^2$ , thereby displacing the tension pulley. During this time the pulley  $S_1$  remains fixed, because the nose  $x$  continues to slide upon the concentric portion of the hub  $y$  and thus experiences no displacement. Only when the operating lever  $H_1$  is drawn back does the tension pulley resume its initial position (Fig. 3), and upon

FIG. 5.

FIG. 6.

continuing to rotate the lever the tension pulley  $S_1$  becomes operative whilst  $S_2$  remains fixed. The pair of tension pulleys of the hand lever  $H_2$  act in a similar manner. It will be noticed that the construction of the turntable permits a full lock to be obtained. The Kühlstein-Vollmer tractor can be fitted to any type of vehicle; it was for some time used on mail-carts in Berlin by the German postal authorities, and has also been applied to a delivery van, which has carried a load of one ton at a fair speed over ordinary roads. At the recent exhibition at the Agricultural Hall we had an opportunity of riding in the vehicle around the demonstrating arena, and although the test cannot be called a practical one the cab appeared to run very quietly and without undue vibration.

## THE HEAVY MOTOR-VEHICLE TRIALS AT LIVERPOOL.

THE interest of the automobile world has this week been centred on the heavy motor-vehicle trials carried out at Liverpool under the auspices of the Liverpool Self-Propelled Traffic Association in conjunction with the Royal Lancashire Agricultural Society. The chief object of the trials is to encourage the development of types of heavy motor-wagons suitable for trade and agricultural requirements in the neighbourhood of Liverpool, which shall be capable of economically taking the place of horse haulage and of competing with the existing railway rates in the transport of heavy loads of goods over distances of up to forty miles. In connection with the trials the Royal Lancashire Agricultural Society offer one gold and one silver medal in each of the four classes mentioned below, the medals being accompanied by the diplomas of both bodies.

The general regulations required that (1) The vehicle shall be self-propelled; (2) the vehicle shall be capable of going anywhere that a horse-drawn vehicle carrying the same load is ordinarily required to go, and of being placed in the same positions and withdrawn therefrom without external assistance; (3) the vehicle shall be capable of working into and out of an embayment of one-and-a-half times its own length; (4) the vehicle shall be capable of starting from rest on and mounting a gradient of 1 in 10; (5) the capacity of any water tanks, whether the same be fitted for feed, cooling or other purposes, shall suffice for a run of fifteen miles on the basis of the consumption during the trial runs; (6) such portion of the platform of the vehicle as is designed to carry the load shall be level, and the height of the floor-line, measured either when light or laden, shall be not less than 3 ft. 6 in., and shall not exceed 4 ft. 3 in.; (7) the vehicle shall conform in all respects to the requirements of the Locomotives on Highways Act, 1896; (8) all working parts shall be properly encased; (9) provision shall be made for the testing of the quantity of water evaporated; and (10) all manœuvres shall be performed by the vehicle when fully laden and provisioned.

The following are the points to be taken into consideration by the judges in making the awards:—(a) Cost—Economy of working, including attendants. (b) Control—Stopping, starting, changing speed, steering and reversing, particularly under adverse conditions, such as on inclines, in confined spaces, or on greasy surfaces. (c) Working—Adhesion on greasy surfaces when light and when laden; noise, smell, visible vapour, dust or other nuisance when travelling; number of mechanical operations requiring attention from the driver; efficiency of brakes; time occupied in preparing the vehicle for service on the road. Speed—within legal limits; ability to travel between the dépôts without taking or receiving supplies of fuel, oil, gas, electrical or chemical materials or electrical current, water, or of any agent employed for actuating the motor or assisting its working; ability to travel between the dépôts without stopping to effect repairs, adjust parts, apply lubricants, or for any other purpose or cause not provided for in the itinerary; freedom from a breakdown of any nature. (d) Construction—Efficiency of wheels, nature and efficiency of gearing, strength of frame and working parts, quality of workmanship, efficiency of springs, freedom from complicated or over refined parts, facility with which repairs can be effected, capacity of bunkers or oil tanks, ratio of available platform area to extreme moving area in any horizontal plane, ratio of tare to weight of freight carried during the trials. (e) Steam-propelled vehicles—Evaporation efficiency of boiler, ample supply of steam, action of feed-pumps or injector, consumption of fuel and water per mile, leakage of steam or water, arrangements for stoking.

The competition was divided into four classes, the entries in each of which were as follows:—

CLASS A.—Minimum load 2 tons, maximum tare 2 tons, minimum level platform area 50 square feet.

*The Automobile Association, Ltd., London.*

*T. Coulthard & Co., Cooper Road, Preston.*

*The Thornton Motor Co., Ltd., Worsley Mills, Manchester.*

CLASS B.—Minimum load 3½ tons, maximum tare 3 tons, minimum level platform area 65 square feet.

*Bayleys, Ltd., Newington Causeway, S.E.*

*The Clarkson & Capel Steam Car Syndicate, Ltd., Deverell Street, London, S.E.*

*The Graham Equipment Co., Boston, Mass., U.S.A.*

*The Lancashire Steam Motor Co., Leyland.*

*Simpson & Bodman, Cornbrook, Manchester.*

*The Steam Carriage and Wagon Co., Ltd., Homefield, Chiswick.*

CLASS C.—Minimum load 5 tons, maximum tare 3 tons, minimum level platform area 80 square feet.

*C. & A. Musker, Ltd., Liverpool.*

CLASS D.—Minimum load 6½ tons, maximum tare 4 tons, minimum level platform area 110 square feet.

*The Steam Carriage and Wagon Co., Ltd., Homefield, Chiswick.*

On arriving at Liverpool on Monday morning we found that out of the eleven vehicles entered only six had put in an appearance, the absentees being those shown above in italics. We are able to give illustrations in Figs. 1 to 6 of the competing vehicles, and before proceeding further it may be useful here to briefly describe them.

The only vehicle competing in Class A is the 2-ton steam lorry (Fig. 3) of Messrs. T. Coulthard & Co. This vehicle is 15 ft. 6 in. long by 6 ft. 6 in. extreme width. The wheel base is 9 ft. 6 in. longitudinally and 5 ft. 8 in. centre to centre of tyres transversely. The platform, which is carried on a steel frame, is 10 ft. 6 in. by 5 ft. 8 in. wide and has therefore 56.7 sq. ft. of available surface for carrying goods. The height of the platform when light is 3 ft. 9 in. and 3 ft. 6½ in. when loaded with 2½ tons. The front wheels are of iron throughout, 2 ft. 9 in. diameter, and have tyres 4 in. wide; the driving wheels are 2 ft. 11½ in. diameter and have tyres 5 in. wide, the former being fitted on Ackermann's system, controlled by worm gearing and a hand wheel. The boiler is of the fire-tube type and has 77 sq. ft. of heating surface; it is constructed for a working pressure of 200 to 225 lb. per sq. in. Water is fed to the boiler by means of a small pump which is driven at a reduced speed by means of gearing. The inside of the boiler is so arranged that it can be lifted out for cleaning without removing any of the steam fittings. Liquid fuel is employed to generate steam. The lorry is fitted with an air condenser placed in the front of the vehicle. The regulation of the supply of the oil to the burner is automatic. The burner proper is a casting suspended inside the fire-box of the boiler by a coil of piping, the oil being forced by compressed air through the regulator to the burner and vaporised on its passage to the orifice. The burner is started by igniting an asbestos pad soaked with ordinary paraffin. The engine is of the triple-expansion vertical type, and develops 14 b.h.p. when running at 500 revolutions per minute. The cylinders are 2½ in., 4½ in., 6 in. by 5 in. stroke. Spur gearing is used to transmit the power from the engine-shaft to the first motion shaft by means of friction clutches. Hans Renold's "silent" chains form the connection between the counter-shaft, the differential gear and the driving wheels. The gearing is arranged to give a ratio of 7, 11½ and 19½ to 1 between the engine and the driving wheels. The vehicle is fitted with two brakes—a hand brake on the second motion shaft and a shoe brake on driving wheels. The former is actuated by a foot lever, the latter by worm gearing. By means of a friction clutch the direction of the vehicle can be readily reversed, which thus gives an additional brake. The water tank holds 50 gallons and the oil tank 25 gallons. The cylinders of the engine are arranged in such a manner as to provide only a very thin wall between the bore of each cylinder, the piston

FIG. 6.—THE THORNYCROFT STEAM LORRY WITH TRAILER.

valves being located at the back of the cylinders. By this system the makers claim that they are enabled to dispense with the usual central bearing, and by using a slightly larger shaft and careful balancing to ensure uniform pressure on the two main bearings. The hot-water tank is also arranged so that the condensed steam is conveyed from the feed-water heater, the air condenser and the drain cocks on the cylinder. The object of using this hot-water tank is as follows: Assuming the cold-water tank to be filled with water, the hot-water tank will then be empty and the proportions of the two tanks are such as to ensure the whole of the cold water having been taken from the tank before the hot-water tank has been filled; the hot water is then transferred to the cold-water tank and the latter filled up. Three forward speeds— $2\frac{1}{2}$ ,  $4\frac{1}{2}$  and  $7\frac{1}{2}$  miles per hour—are provided, with one (two miles per hour) reverse.

Coming now to Class B, it is unnecessary to describe at length Messrs. Bayleys' interesting vehicle (Fig. 2), of which we published a description so recently as our issue of the 21st ult. We may mention, however, that the working pressure of the boiler is from 175 to 250 lb. per square inch. It is fed by means of a pump on the engine and an injector. The design of the underframe of the vehicle is claimed to provide for perfect grip of both driving wheels on the road surface under every varying condition. Two ratios of gearing are provided, viz., 13·7 to 1, and 8·4 to 1. The wheels (diameters 2 ft. 9 in. front and 3 ft. hind) have wood spokes and felloes and steel stocks. The tires are 4 in. front and 5 in. hind. The capacity of the water tank is 75 gallons. The tare weight of the vehicle is 2 tons 19 cwt. 2 qrs.; with water and fuel in running order it weighs 3 tons 8 cwt.

The Clarkson Capel 4-ton steam lorry (Fig. 1)

DIMENSIONS RECORDED JULY 29TH, 1899.

3. No cover on driving chains.  
(4) Total length of motor and trailer 32 ft. 6 in.

has a frame constructed of channel steel, to which the boiler, machinery, and springs, as well as the platform and cab, are attached. The boiler is of the vertical type, with small inclined cross tubes of steel. The heating surface is 66 square feet, supplemented by 14 square feet of heating surface in a copper feed coil located in the uptake. The boiler feed is automatically controlled by the Clarkson-Capel reciprocating float gear, which relieves the driver's attention from the water gauge. A pump, driven by the main engine, operates in conjunction with the float gear, but an injector is provided as a stand-by. The boiler is also fitted with steam and water gauges, steam blower, twin safety valve, set to 220 lb. (being 20 lb. in excess of the working pressure), blow-off cock, with safety bye-pass, mud plugs and fire door. The boiler is fired by one of Clarkson's oil Bunsen burners. In this apparatus the oil is vaporised in a heated tube, and a regulated jet of vapour induces with a suitable proportion of air, which passes into a mixing chamber, and from this chamber the mixture issues through regulated openings, and is burned. The preliminary mixing of air with the vapour, it is claimed, improves the combustion, prevents smoke, and also enables a higher power flame to be produced efficiently in a fire box of given dimensions than would otherwise be possible. The engine is a two-cylinder compound (marine type) enclosed and self lubricating by an oil force pump and distributing tubes. It has Stephenson link gear and piston valves to both cylinders. The high pressure cylinder is 2½ in. diameter; low pressure 6 in. diameter by 4 in. stroke. The case is constructed of aluminum and the cylinders are fitted with safety relief valves and drain cocks. Two speeds are provided corresponding to six and two miles an hour. The exhaust steam is dealt with by special atmospheric condensers fitted into the roof of the cab, a propelling fan being used to circulate the air for cooling purposes. The condensed steam returns to the water tanks located in front on each side of the boiler. The oil tanks are located in the rear of the car. A steam brake is fitted to each of the driving wheels, and comes into operation by a reverse movement of the steam regulation lever. Another brake in the form of a band on the engine shaft is operated by a foot lever; the level platform area is 66 square feet.

The Lancashire Steam Motor Co.'s steam lorry is shown in Fig. 4. The boiler is of the Company's fire-tube type, and has 110 square feet of heating surface. It is constructed for a working pressure of 200 lb. The water is fed to the boiler by means of a small feed-pump, which is set to give a constant feed. The wagon is fitted with an air-condenser, on the roof of the cab. The inside of the boiler can be lifted out for cleaning without removing any of the steam

fittings. Liquid fuel is employed to generate steam. When the steam acquires the desired pressure the deflection of a special diaphragm causes the closing of the oil supply valve, and this

FIGS. 7 AND 8.—DIAGRAM OF GRADIENTS—HILL-CLIMBING CONTESTS.

valve is re-opened by the action of a spiral spring when the steam pressure is reduced. The supply of oil to the burner is thus so regulated that steam pressure should be maintained

automatically. The engine is of the compound, vertical, enclosed type, and gives 14 b.h.p. at 500 revolutions. Spur gearing is used to transmit the power from the engine-shaft to the first counter-shaft, reverse motion being effected by means of a clutch. Hans Renold's chains form the connections between the first counter-shaft, the differential gear and the driving wheels. The vehicles are fitted with two brakes, a hand-brake on the first counter-shaft and a shoe-brake on the driving wheels. The former is actuated by a foot-lever, the latter by worm gearing. The water tank holds 46 gallons, and the oil tank 20 gallons.

The Steam Carriage and Wagon Co.'s (Ltd.)  $3\frac{1}{2}$ -ton steam lorry (Fig. 5) is now fairly well-known and consequently does not require a lengthy description. The boiler is of the Thornycroft water-tube type, with special arrangements for the control of steam, and is fitted with a silent blowing safety valve and an auxiliary safety valve with hand-easing gear. The boiler is so constructed that all its tubes can be thoroughly cleaned inside and outside, and, when necessary, can be re-tubed in position. An injector is also fitted for auxiliary feeding in addition to the feed pump. The engine is compound, reversing and entirely enclosed in a dust-proof and oil-tight casing. The gearing is of the silent chainless type and including a two-speed gear. The wheels are of the military type, with metal naves, oak spokes, ash felloes. A powerful brake is fitted capable of stopping the vehicle within

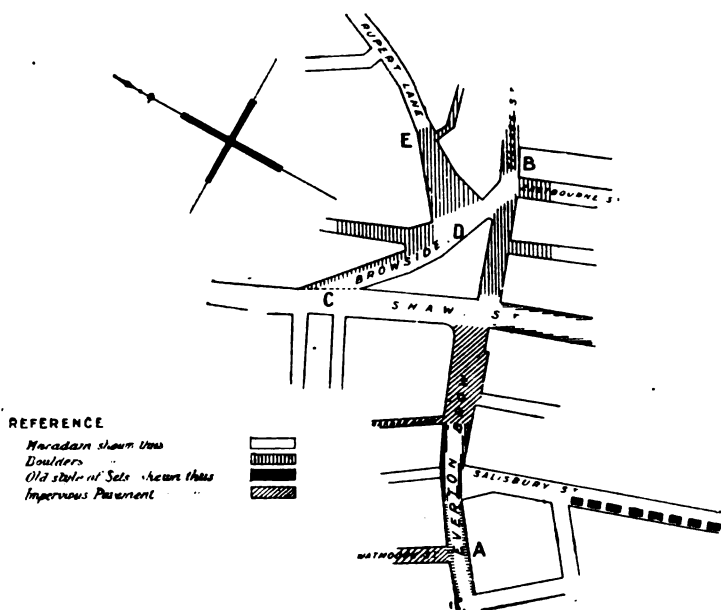

FIG. 9.—DIAGRAM OF ROUTE OF HILL-CLIMBING CONTEST.

20 ft. when at full speed. The "body" is of the open-platform type with a floor area of 65 square feet. The weight of vehicle light is 2 tons 18 cwt., while the weight in running order with full load is 7 tons 1 cwt.

In Class D the only entry was that of the  $6\frac{1}{2}$ -ton steam lorry and boiler (Fig. 6) of the Steam Carriage and Wagon Co., Ltd. The lorry is identical with the one above described, the only difference being that it is provided with a 3-ton trailer. The weight of the vehicle light is 3 tons 19 cwt. 2 qr., while the weight in running order with full load is 11 tons 15 cwt.

On Saturday last the competing vehicles were measured and weighed under the supervision of the judges—Mr. M. C. Bannister, A.M.I.C.E., Mr. E. R. Calthrop, Mr. S. B. Cottrell, M.I.C.E., Professor Hele-Shaw, LL.D., M.I.C.E., Mr. Boverton Redwood, F.R.S.E., F.I.C., and Mr. H. H. West, M.I.C.E. The measurements, etc., are given in the table on the preceding page.

#### THE TRIALS.

The first day, Monday, was devoted to a trial of the hill-climbing capabilities of the vehicles. The course selected was a zig-zag one from Watmough Street, by way of Everton

Brow, Shaw Street, and Browside, to Rupert Lane, a distance which, although only about one-fifth of a mile, severely tested the powers of the motors. The smallest gradient is 1 in 22, and the steepest 1 in 9, over roads which are mainly composed of granite setts and petrified kidneys (see diagrams Figs. 7 to 9).

The hill-climbing trial was divided into two sections; first the vehicles had to go over the course unloaded, and again with a full load. Messrs. Bayleys' steam trolley, unloaded, made a false stoppage, but recovered and restarted with a few efforts at the authorised point of stoppage on the first gradient. Afterwards, with a load of  $3\frac{1}{2}$  tons, it had some difficulty in getting off from the stopping point on the

FIG. 10.—THE HILL-CLIMBING CONTEST—COULTHARD'S LORRY.

brow, but otherwise behaved well in ascending and descending. Clarkson & Capel's 4-ton steam lorry failed to ascend the hill unloaded, and the driver, in going down hill, was compelled, from the overpowering momentum and speed involved, to make a sweep which looked terribly dangerous, but which fortunately was achieved without mishap. The ascent with the load was made rather slowly, and a ton had to be taken off before the work could be accomplished. The Thornycroft vehicle seemed to the ordinary onlooker to do its work better than any, both unloaded and loaded, taking into account the accuracy of stoppage and the way in which it ascended and returned. Messrs. Coulthard & Co's vehicle, which is for some reason out of the competition, had tolerable success, this remark also applying to the Leyland vehicle. The Thornycroft  $6\frac{1}{2}$ -tons steam lorry and trailer did well unloaded, but better with the heavy load, stopping and starting almost instantaneously.

The programme on Tuesday was a run of about thirty-five miles, the route being: Prince's Dock, Walter Street, Dale Street, William Brown Street, London Road, Prescott

Street, Old Swan, Prescot, Rainhill, Great Sankey, Widnes, Ditton, Speke Church, Garston, Aigburth Road, Park Road, St. James Street, Park Lane, Canning Place, South Castle Street, Castle Street, Water Street; back to the Dock Yard. The start was made shortly after half-past ten, the vehicles setting out separately, and stoppages being made on the steepest gradients both in ascending and descending to test the accuracy and facility with which the cars travelling at their ordinary rates of speed could be brought to a standstill and restarted. The vehicles received their stores before setting out, and were not allowed to take in any additional supplies on the route excepting at fixed points, where only water was provided. No. 2 vehicle (Thornycroft's trailer) maintained the best speed throughout, its average being about six miles per hour, which the regulations of the Locomotives on Highways Act, 1896, permit that particular class of vehicle to do. The other vehicles competing were only allowed a maximum speed of five miles per hour. The

severe enough test of the wagons' capabilities, as it lay amid thick traffic.

Despite the drawbacks, no mishap occurred, and the wagons, with their heavy loads, went up the hills with ease. Between Liverpool and Prescot the pace was naturally slow for these reasons, but beyond, where macadamised roads replaced paved ones, the heavy lorries steamed along at a good rate. Within two miles of Warrington the road marked out for the course ran at an acute angle to the one the wagons were travelling by, but this did not seem to affect them in the least, and the nasty turning was negotiated without any trouble.

On Tuesday evening a company of gentlemen, including the officials, judges, and representatives of several important Government Departments, etc., dined together in the Adelphi Hotel, Liverpool, under the presidency of Professor Hele-Shaw. The improvements which had taken place since last year in the competing vehicles, the generally satisfactory re-

FIG. 11.—THE HILL-CLIMBING CONTEST—THE THORNYCROFT LORRY AND TRAILER.

vehicle referred to, carrying a load of  $6\frac{1}{2}$  tons, reached the Liverpool depot shortly after five o'clock, having accomplished the run without a hitch. It was closely followed by the same firm's vehicle No. 1, carrying a load of  $3\frac{1}{2}$  tons. Vehicle No. 5, belonging to the Lancashire Steam Motor Company, with a load of four tons, arrived next, the remaining ones competing reaching Liverpool in fairly close order. The most important result deduced from Tuesday's trials was a demonstration of the marked advance on last year's trials in the stability of tires and wheels. Last year these parts of the vehicles were generally too weak to bear the strain of vibration over rough roads, and had to be frequently repaired. The route selected, though it had no gradient so steep as that on Monday's hill-climbing trials, included some rather stiff acclivities, the chief of which was Prescot Hill, its gradient being 1 in 17. The first part of the course was a

FIG. 12.—THE HILL-CLIMBING CONTEST—THE THORNYCROFT STEAM LORRY.

sults of the tests this week and the adaptability of automobile vehicles as a substitute for horse traction furnished a theme of universal congratulatory comment in the after-dinner speeches.

On Wednesday another run of about thirty-five miles was made, the route being Prince's Dock, Chapel Street, Tithebarn Street, Moorfields, Dale Street, Byrom Street, Scotland Road, Walton Road, County Road, Rice Lane, Walton Vale, Aughton, Ormskirk, Scarth Hill, Rainford, Mossborough, Knowsley, The Hazels, Old Swan, Prescot Street, London Road, William Brown Street, Dale Street, Moorfields, Tithebarn Street, Chapel Street, to the Dock-yard. The competing vehicles set out from the dock yard about ten o'clock. The steam lorry of Messrs. T. Coulthard and Co., which had been withdrawn from the contest on the first day, did not take part in the procession on account of

certain minor defects which could not be repaired in time, and from the customary driver being unexpectedly called out of England. Owing to the preparation for the electric tram-cars in Scotland Road the original route mapped out had to be slightly departed from, the cars reaching the Rotunda Theatre by the way of Marybone, Gardner's Row, Bevington Bush, and Maddox Street, a circumstance which added both to the distance and to the difficulties of manœuvring from the narrowness of these streets. Additional inconvenience in the route was experienced at Ormskirk, where part of Moor Street is undergoing repair. The inconvenience was modified, however, through Mr. R. C. Ivy, the district surveyor, kindly placing men with flags at various points to indicate the routes. The vehicles performed their work with much the same success as on the previous day. Up to Aughton there had been no mishap, and the competition was carried through without anything which could be classed in that category—an exceedingly gratifying circumstance as compared with that of last year's, when the rough roads in the vicinity of Ormskirk practically demolished several of the wheels. The competing cars arrived at the Prince's Dock, in completion of the run, very much in the same order as on the previous evening, Thornycroft's No. 2 being first, their No. 1 second, and the others following at short intervals. All the vehicles which started succeeding in completing the allotted journey without accident of any kind. Two got their axles a little overheated, but not so seriously as to necessitate a stop, the affected parts being successfully seen to in the time necessitated by the delay at one of the depots.

The appended table shows the times occupied by the different vehicles on the runs on Tuesday and Wednesday:—

| August 1st. |                     |                        |                            |  |
|-------------|---------------------|------------------------|----------------------------|--|
| No. of Car. | Name.               | Time of Leaving Depot. | Time of Arriving at Depot. | Time occupied (including 45 min. compulsory stop). |
|             |                     | h.m.                   | h.m.                       | h.m.   |
| 1           | Thornycroft .. ..   | 10.20                  | 5.54                       | 7.34   |
| 2           | Thornycroft .. ..   | 10.17                  | 5.33                       | 7.16   |
| 3           | Coulthard .. ..     | 10.46                  | 8.29                       | 9.43   |
| 5           | Leyland .. ..       | 10.33                  | 6.51                       | 8.18   |
| 6           | Clarkson & Capel .. | 11.38                  | 9.11                       | 9.33   |
| 9           | Bayleys .. ..       | 10.26                  | 7.37                       | 9.11   |
| August 2nd. |                     |                        |                            |  |
| 1           | Thornycroft .. ..   | 9.58                   | 5.13                       | 7.15   |
| 2           | Thornycroft .. ..   | 9.55                   | 4.41                       | 6.46   |
| 5           | Leyland .. ..       | 10.13                  | 6.20                       | 8.7  |
| 6           | Clarkson & Capel .. | 10.34                  | 6.15                       | 7.41   |
| 9           | Bayleys .. ..       | 10.15                  | 6.29                       | 8.14   |

As already mentioned, each of the vehicles in their runs has been accompanied by observers, the names of the gentlemen who have acted in that capacity being shown below:—

| BAYLEY'S.                   |                      |                        |
|-----------------------------|----------------------|------------------------|

|                             | C. Muspratt          | J. H. Clarke           |

Throughout, the trials have been followed by a very large and interested gathering, and it must have been encouraging to the authorities to find such deep interest displayed in the tests. Among the many persons who have followed the trials may be mentioned: From the War Office, Mr. L. F. Hawkins, R.E., Captain J. H. Ll. Johnstone, Captain H. G. Joly de Lotbiniere; from the Post Office, Mr. Salisbury (postmaster), Mr. Fairgray (chief superintendent), Mr. Barrett (superintendent), Mr. Thompson (assistant superintendent), Mr. James (chief clerk); from the Local Government Board, Mr. G. W. Willcocks; from the Liverpool Chamber of Commerce, Mr. F. C. Danson and Mr. A. L. Jones; and from the Liverpool Dock Board, Mr. Miles Kirk Burton. Other important bodies also represented included the Automobile Club de France, Liverpool Corn Association, the Corporations of Glasgow, Birmingham, Manchester, Bradford, Salford, Southport, Barrow-in-Furness, Bootle, Chester, Birkenhead, and the local authorities of Waterloo, West Hartlepool, Gateshead, Wellington Quay, and some of the London Vestries. Amongst those present on the various cars accompanying the trials were Mr. M. C. Bannister, Mr. E. R. Calthrop, Mr. S. B. Cottrell, Mr. A. Ashworth, Mrs. A. Ashworth, Mr. Darley (Leeds), Mr. Holt (Birmingham), Mr. J. Walwyn White, Mrs. Walwyn White, Miss D. Shrapnell Smith, Miss N. Smith, Mr. J. J. Denney (Liverpool), Mr. A. Davis (Audenshaw), Mr. W. Byrne, Mr. Cooper (Cookstown), Mr. Ernest Samuelson (Banbury), Dr. Wolff (Berlin), Mr. W. Fletcher, Mr. Tinne, Mr. H. W. Rushton (Bolton), Mr. Douglas Leechman, Mr. J. Hartley Burton, Mr. S. T. Chadwick, Mrs. Hartley Burton, Miss Prescott, Mr. J. A. Bradshaw, Mr. Alfred Burgess, Mr. Charles Cordingley, Mr. J. Puxley Pearse, Mr. W. Naylor, Mr. Preston, Mr. A. J. Aldred, Mr. Pettigrew, Mr. Burrows, Mr. Musker, Mr. Spurrier, Mr. J. Harvey, Mr. Toulmin, Mr. Norris, Mr. Jesse Ellis, Mr. Critchley, etc.

Lord Derby was expected to attend some part of the proceedings, but finding himself unable to carry out his intention on account of a pressure of engagements, including the very large house party being given by him at Knowsley in connection with the Royal Lancashire Agricultural Show, he conveyed his regrets both by letters to Mr. Shrapnell Smith, the secretary, and through the Hon. Arthur Stanley, M.P. The gentlemen who have been watching the trials on behalf of the Government and various corporations have expressed themselves highly satisfied with the results obtained. They all agree that since the trials of a year ago distinct advance has been made in the matter of heavy motor-vehicles. Major Hawkins, R.E., who represented the War Office, expressed his belief that ere long self-propelled vehicles would play an important part in respect of the transport work in the Army. The trials have been carried through without a hitch and reflect great credit on the organizing authorities. A word of praise must also be awarded to the indefatigable attention of the honorary secretary, Mr. E. Shrapnell Smith.

#### THE AWARDS.

Just as we go to press we learn that the following awards have been made: Class B.—Gold Medal, the Steam Carriage and Wagon Co., Ltd. Silver Medals, Messrs. Bayleys, Ltd., and the Lancashire Steam Motor Co. In Class D a gold medal has been awarded to the Steam Carriage and Wagon Co., Ltd.

A NEW company has just been formed at Marseilles, France, with a capital of £14,000, to be known as Les Ateliers de Constructions d'Automobiles (Turcat, Mery & Co.).

THE Canadian Government Commissioner in Sydney, in a recent report, states that there is no demand for motor-carriages in Australia as yet, but there is sure to be within a short time. The manufacturer first in the field with an effective vehicle will have the best of the market.

## CORRESPONDENCE.

### SOME FAST TRAVELLING BY THE PENNINGTON TORPEDO.

TO THE EDITOR OF *The Motor-Car Journal*.

SIR,—Some months ago my statements in regard to the speed of the Pennington car were ridiculed by several gentlemen. Since that time I have made several efforts with a view of getting the Pennington Torpedo, as it is commonly

favourable to me, as he had had some considerable experience upon this particular car. We duly arrived at Catford, and after one or two trial spins found that the torpedo could go, and was going at the rate of 36 miles per hour. We came to the conclusion that a higher gear could be used without affecting the speed of the engines. We therefore changed the gear, and with good results. We reeled off laps at the rate of from 39 to 40 miles per hour. In fact, one lap was done in the extraordinary time of 29½ secs., the track being three laps to the mile, this being record for any type of machine.

Thinking a few photographs taken at this high speed would be interesting, we engaged the services of Messrs. Curzon Robey & Co. to come down and take a few snapshots. The first trial was not a success. The exposure was timed to the 70th part of a second, and the result was not at all one which could be called a photographic success. The next day Messrs. Curzon Robey & Co. informed us that they would use other apparatus which was sure to prove a success, and which was capable of taking photographs at an exposure of 1000th part of a second. Arrangements were accordingly made for the following day, when success crowned the efforts of the photographer.

FIG. 1.

called, for a few trial spins upon one of the London tracks. Until lately my efforts in that respect were unsuccessful, but last week, after a little persuasion, Mr. Pennington kindly gave me permission to take the torpedo for a trial spin upon one of the tracks. I then looked about for a steersman, one

FIG. 3.

Photo No. 1 will give your readers some idea of the position adopted by the writer to avoid any wind-resistance and with a view of taking corners; here we are snapped just after our start, the pace being then about 28 miles per hour. No. 2 shows a picture taken broadside-on upon the banking, and one can judge the speed by carefully looking at the shape of the two wheels shown and by the clinging position of the writer, who, travelling at that enormous pace (we were now doing 40 miles per hour), was far from comfortable.

No. 3 shows the position when entering the straight; here the writer is seen clinging on to the friction clutch, which, owing to the immense strain upon the back wheel when turning a corner, has a tendency to slip out.

Perhaps a few details of the motor in question would be interesting. The motor itself is a double steel cylinder, with 4 in. bore by 10 in. throw, and geared direct to the back or driving wheel, there being two speeds actuated by two friction clutches. The machine has a long wheel base, as can be seen by photo No. 2. Electric ignition is used, and the petrol descends direct into the combustion chambers, doing away with a carburettor. In addition to the two gears the speed can naturally be regulated by the quantity of petrol allowed to enter the combustion chambers. The wheels are 24 in. by 4 in., fitted with Pennington tires, and it is astonishing

FIG. 2.

being necessary to drive and one to steer for the particularly fast work I intended doing. After a good deal of talking I managed to persuade one of Mr. Pennington's mechanics to accept the position of steersman. This was all the more

what they have stood. I may mention that the machine was built by Mr. Pennington at Coventry two and a half years ago, and without doubt holds the travelling record.

Yours faithfully,  
C. G. WRIDGWAY.  
Keppel Road, Chorlton-cum-Hardy,  
Manchester, August 2nd, 1899.

### A LADY ON MOTOR-CARS.

TO THE EDITOR OF *The Motor-Car Journal*.

SIR,—In conversation with my lady friends I find that their interest in motor-car matters increases in proportion to the interest taken by royalty. Does this not also apply to the general public? Now, as this new industry is not a passing fad but something that will revolutionise our street traffic and means of cheap transport of produce from country to towns, it is worthy of all the support royalty can bestow upon it.

The firm that can induce our beloved Queen to take a ride on a motor-car will deserve well of the trade and give a fillip to nervous ladies who, when once having ridden on a car, will find there is no cause to be nervous. There are several causes for nervousness in horse-drawn vehicles that do not exist in motor-cars.

We ladies are not likely to overlook the economical side of motor-caring *versus* horse-keeping. I am thinking of the effect of motor-cars *versus* horses when the roads in winter are such that the poor horses can only with difficulty keep their footing. Under few conditions will the usefulness of cars be more apparent.

When will the London County Council adopt electrical fire engines instead of keeping a staff of horses standing at a ruinous expense at fire stations? Electrical stations would soon save their expense. Will one of the L.C.C. members state what is the annual cost of the horses' keep? This item of taxation might be saved, as the sale of the horses and purchase of electrical cars should nearly balance. I hope to see one of our enterprising manufacturers inviting the members of the County Council to a run to Brighton and back, and convert them wholesale; or perhaps one of the rich syndicates which hold such valuable patents will take the hint and show how patriotic they are.

Yours truly,  
MRS. SUBURBAN VILLA.  
July 31st, 1899.

### HORSE POWER OR COLT POWER.

TO THE EDITOR OF *The Motor-Car Journal*.

SIR,—Mr. Sangster's recent letter to the Press may mislead the general public and leave them to think that the Aster motor does not develop the  $2\frac{1}{2}$  h.p. advertised. I am able to state that the latest  $2\frac{1}{2}$ -h.p. motors are 72 mm. bore by 80 mm. stroke, and every motor has to pass what is known as the dynamo test, which is a more satisfactory method of ascertaining the horse power of small motors than taking indicator diagrams or brake readings. Therefore, any one purchasing an Aster motor can rely upon it developing  $2\frac{1}{2}$  h.p. before it is allowed to leave the works.

Lowestoft,  
August 1st, 1899.  
Yours truly,  
W. L. ADAMS.

### MOTOR-CARS IN THE NORTH.

TO THE EDITOR OF *The Motor-Car Journal*.

SIR,—I notice a paragraph in your Journal crediting the City Syndicate, Newcastle, with being the first to run a motor-car service in Newcastle, whereas the credit for such belongs to the Tyne Motor-Car Company, who were running a regular service prior to that or any of the other companies which have recently sprung up. This is a matter which there is no doubt about, and is easily proved.

It becomes monotonous to hear the claims of certain parties as being the pioneers. Mr. Blacklock and myself have done more to popularise the motor industry in the North than they

or indeed we might say anyone else. In fact, it is due to our efforts that we have been instrumental in "forcing the hands" of most of the companies in this district. "Honour to whom honour is due" and "Fair play is a jewel" are mottoes which might be brought forward with advantage to the claims of certain parties.

Trusting you will give this the same prominence as the said paragraph,  
Sunderland,  
July 31st, 1899.  
Yours faithfully,  
FRED TURVEY.

A MOTOR-CAR race is being organized by the Swiss Automobile Club; it is to be run off early in September in the neighbourhood of Lucerne.

M. RENE DE KNYFF has sent a cordial letter of thanks to the Automobile Club of Great Britain for their recent congratulatory telegram in connection with the result of the Tour de France.

THE first motor-car that ever visited Thurso was seen in the streets of that town on Monday last, and created great interest. It belongs to Major Howie, of Bighouse, Sutherlandshire.

IN connection with the automobile exhibition which is to be held in Berlin next month preparations are, it is reported, now being made for a race to Dresden for heavy cars and to Eberswalde for motor-cycles.

A MOVEMENT is on foot to form an Automobile Club in Philadelphia. One of the first duties of the club will be to test the validity of the rule of the Park Commissioners excluding motor-carriages from the Fairmount Park.

IN connection with the coming fêtes at Lons-le-Saulnier, France, arrangements are in hand for the running off of an automobile race between that town and Lyons and back on the 20th inst. The distance is about 144 miles.

AUTOMOBILISTS who purpose visiting Henley should note that at the last meeting of the Town Council a resolution was adopted to the effect that the Town Clerk should call the attention of the police authorities to the pace at which motor-cars were allowed to travel in the streets.

MESSRS. HEWETSONS, 7 Dean Street, Oxford Street, W., announce that in future all their Benz Ideal cars will be fitted with Connolly tires on the front wheels as well as the rear wheels. The front tires will be provided with a special flat tread in order to avoid getting caught in tram lines.

IN connection with the Midland Cycle and Motor-Car Exhibition which is to be held at Bingley Hall, Birmingham, at the end of January, 1900, it is proposed to organize a series of motor-car and cycle trials on the roads between Birmingham and Coventry, Wolverhampton and Redditch, not merely for speed purpose but for weight-carrying, hill-climbing and general utility.

AT the invitation of Sir William H. Crundall, J.P., the Mayor of Dover, the Committee of the Automobile Club have undertaken to render every possible assistance in reference to the automobile exhibition which it is proposed to organize in connection with the Congress of the British Association in the middle of September. The Secretary of the Club has, *ex officio*, been appointed to the Committee of the Exhibition.

A LARGE contract for motor-carriages is reported as having been placed by the Electric Vehicle Co., of New York. The contract is for no less than 4,200 vehicles, involving an expenditure of 8,000,000 dols., and it will include about 4,000 hansoms, broughams, and other passenger carriages, and 200 delivery wagons. The batteries will be made by the Columbia Automobile Co. (which has exclusive rights from the Electric Storage Battery Co. for batteries for vehicles); the motors by the Siemens & Halske Electric Co., of Chicago; the "bodies" by the Studebaker Carriage Co., of South Bend, Ind.; and the other work by the Columbia and Electric Vehicle Co.

## MOTOR-CARS ON THE CONTINENT.

### Motor-Car Construction in Italy.

QUITE a number of motor-car companies have lately sprung into existence. The latest is La Fabbrica Italiani di Automobili, which, according to a correspondent, has just been registered in Turin with a capital of £32,000. It is stated that large works for the construction of motor-cars are to be established by the company in Turin. No details are available as to the type of car to be turned out or as to the motive power, but it may be mentioned that the Società Elettrotecnica Italiana is interested in the new undertaking.

### The Paris 1900 Exhibition and Motor-Car Trials.

THE Committee of the Automobile Section of the Paris 1900 Exhibition has, we learn, decided to organize a series of motor-car trials during the course of the show. It is expected that the programme will be the same as that carried out by the French Automobile Club last year, viz., a speed trial, a motor-car competition, and a *poide lourds* or heavy motor-car competition. It is probable, too, that the organization of the trials will be entrusted to the Committee of the Automobile Club de France.

### More Petroleum-Spirit Motors.

IT is announced that Messrs. E. Giraud & Co., engineers, of Doullaincourt (Haute-Marne), France, have decided to take up the construction of petroleum and spirit motors for motor-cars and that they are enlarging their works for that purpose.

### Motors for Electrical Vehicles.

AS showing that the large German electrical engineering concerns have begun to recognise the possibilities of the automobile movement, we may mention that Messrs. Schuckert & Co. of Nurembourg are now manufacturing electro-motors for electrically-propelled vehicles. One of their first productions in this direction is a 2-h.p. motor intended for a normal speed of 1,500 revolutions per minute, while its weight is stated to be 107 lb.

### A New Bollée Voiturette.

LA SOCIÉTÉ DES VOITURETTES AUTOMOBILES has just introduced a new type of Bollée voiturette—viz., a vehicle fitted with two motors in place of the one hitherto provided. The two engines are located one on each side of the rear wheel, and are each provided with their own carburettor, exhaust-box, etc. The petrol tank for the burners is located as usual behind the rear seat, while the main supply tank in the new vehicle is built on the mud-guard of the rear wheel. The fly-wheel and the governor are located centrally, under the seat. No change has been made in the transmission gear, but two brake shoes are now provided in place of the one hitherto relied upon.

### Antwerp Taxes Motor-Vehicles.

THE local authorities of Antwerp have just decided to impose an annual tax on motor-cycles and motor-vehicles as from January 1st next. Motor-cycles will be taxed 20 fr. for single-seated machines, and 30 fr. in the case of machines having seats for two or more persons. The tax for single-seated voiturettes has been fixed at 30 fr., while for motor-cars having accommodation for two or more passengers an annual tax of 40 fr. will have to be paid.

### Motor-Vehicles at Ghent.

THE Provincial Exhibition which opens at Ghent, Belgium, to-morrow, the 5th inst., comprises an automobile section. We understand that a track has also been provided on which demonstrations of motor-vehicles in operation will be given. The show remains open until the 20th inst.

### A Paris-Nice Record Race.

OUR French contemporary, *La France Automobile*, is offering a gold medal for a record race to be run off early next year between Paris and Nice. The course will extend over two days, the first day's journey being from Paris to Lyons, and the second from Lyons to Nice.

### A New French Electrical Vehicle Co.

L'ELECTROMOTION is the title of a new company which has just been formed at Levallois-Perret (Quai Michelet), France, with a capital of £20,000, to construct electrical vehicles, establish charging stations, etc. The list of directors of the new concern contains the names of M. Hart O. Berg, M. A., Lefevre, and M. W. de Blest-Gana.

### A Paris-Lille Race.

THE authorities of the Lille Velodrome are busily engaged on the organization of an automobile race between Paris and Lille, to be run off on the 20th inst. The course will be divided into two sections: (1) Motor-cycles of a maximum weight of 440 lb., and (2) motor-cars. Five money prizes are being offered in each section.

### Le Criterium des Electriques.

THIS event, promoted by *Le Sport Universel Illustré*, took place on Saturday last over a course of about 50 kilometres. The start was effected at Porte Maillot, Paris, at 9 a.m., the competitors passing through the Avenue de Neuilly, Bezons, Houilles, Maisons Lafitte, La Croix de Noailles, Poissy, Saint Germain, Vésinet, Chatou, Rueil, Suresnes and Saint Cloud, finishing at Les Chalets du Cycle in the Bois de Boulogne. There were three categories:—Vehicles of 1,200 kilos. and upwards, vehicles of 800 to 1,200 kilos., and vehicles weighing less than 800 kilos. All the twelve competitors entered for the event started. They were:—H. O. Berg (Columbia) 670 kilos., Phillippart (Columbia) 995 kilos., Sheldon (Columbia) 1,480 kilos., Herriz (Columbia) 1,080 kilos., Delory (Columbia) 1,140 kilos., Beauvalet (Columbia) 1,125 kilos., Bouquet (B.G.S.) 970 kilos., Garcin (B.G.S.) 990 kilos., Cuvelier (B.G.S.) 1,180 kilos., Patin (Patin & Réquillard) 1,260 kilos., Créanche (Créanche) 670 kilos., Mildé (Mildé) 2,200 kilos. The winners of the respective classes proved to be Messrs. Sheldon, Phillippart and Berg, while the special prize for resistance was won by Cuvelier (B.G.S.). The fastest time was accomplished by Phillippart (Columbia) who covered the route at an average speed of 39 kilometres per hour. After the race all the competitors and their friends partook of a sumptuous luncheon at Les Chalets du Cycle.

### The Paris-Ostend Race.

IN the course of a recent conversation with M. Jenatzy, the famous racer stated that it was his intention to compete in this race with "La Jamais Contente," and that he had made the necessary arrangements for recharging at three points *en route*.

# The Paris—St. Malo Race.

M. ANTONY'S 16-H.P. MORS CAR.

THE VALLÉE 16-H.P. RACING CAR.

M. JENATZY'S 16-H.P. MORS CAR.

M. DE KNYFF ARRIVES TO WITNESS START.

(From Our Own Correspondent.)

THE "Tour de France" race over, the interest of the French automobile world has this week been centred on the Paris-St. Malo race, which took place on Sunday last. Many of those whose success in the "Tour de France" was doubtful were glad to find in the Paris-St. Malo race an opportunity to re-establish their credit.

It is to be noticed that none of the well-known Panhard-Levassor champions started in this race, so that it was practically a run-over for the new Mors 16-h.p. cars, which found no serious vehicle to check them. We must nevertheless mention the appearance of a new Vallée car, very original in its design, which was handled by a well-known English "chauffeur," who entered under the suggestive name of "Flash." It will be remembered that the Vallée racer also started in the "Tour de France," but met with a series of accidents which prevented it completing the journey. The bad luck was so great that punctures occurred even before the start, so that "Flash" only left long after the others. Although the result of the Paris-St. Malo race has not been very brilliant for the Vallée car we must nevertheless congratulate one of the first English sportsmen to compete in a French race.

The start of the race took place on Sunday morning last, the voiturettes leaving at 5 a.m., the motor-cycles at 6 a.m., and the cars at 7 a.m., the number of starters being respectively ten, fifty-one, and thirteen. The following are the times of those competitors who finished the race:—

## VOITURETTES.

1. Rivierre, 10 h. 44 m. 30 s.
2. Doriot, 12 h. 17 m.
3. Dilligeon, 13 h. 44 m.

## MOTOR-CYCLES.

1. Renaux, 7 h. 11 m.
2. Corre, 8 h.
3. Tart, 8 h. 4 m.
4. Rodriguez, 8 h. 4 m. 30 s.
5. Gleize, 8 h. 5 m. 45 s.
6. Rigal, 8 h. 18 m.
7. De Méaulne, 8 h. 28 m.
8. Bar, 8 h. 29 m.
9. Péron, 8 h. 42 m.
10. Delisle, 9 h.
11. Cormier, 9 h. 56 m.
12. Griet, 9 h. 56 m.
13. Zerfuelli, 10 h. 30 m.
14. Bistouriste, 11 h. 16 m.
15. Caillou, 13 h. 3 m.
16. Rendu, 13 h. 32 m.

## CARS.

1. Antony, 7 h. 32 m.
2. E. Levegh, 7 h. 40 m. 30 s.
3. Henon, 8 h. 32 m.
4. E. Heath, 8 h. 35 m.
5. E. Flash, 8 h. 51 m.
6. De Champobert, 9 h. 56 m.
7. E. Jenatzy, 10 h. 6 m. 30 s.
8. E. Huguet, 10 h. 11 m. 1 s.
9. Hachette, 10 h. 38 m.
10. Ravel, 11 h. 28 m.
11. De Lucenski, 11 h. 51 m.

SNAP-SHOTS TAKEN AT STARTING POINT OF PARIS-ST. MALO RACE.

As already stated, the Paris-St. Malo race was a run-over for the Mors cars, Antony, one of the most skilful cycle racers in his time, easily winning the first prize. Apart from the cars, the real winner of the race, who covered the distance in twenty minutes less than any car, was M. Renaux, who, on a tricycle of his own construction, covered the distance of 372 kil. in 7 h. 11 m.—that is to say, at an average speed of over 52 kil. per hour (over 32 miles). This is a very remarkable performance, which does the greatest credit to the “chauffeur” Renaux, and to the tricycle of which he is the builder, and which is fitted with a new horizontal motor. It must be borne in mind that a Sunday is perhaps the worst day of the week that could be chosen for such a race, for on that day both towns and villages are filled with people, not to speak of the numerous cyclists who are met on the road. It is marvellous that no accident happened, and this shows once more that motor-cars are not so very dangerous, even at a speed of thirty miles per hour, as many like to imagine. The voiturettes did not make a very brilliant showing considering that out of ten which left the starting point only three reached St. Malo. The first prize in this class has been won by Rivierre on a Phébus tri-voiturette fitted with a  $2\frac{1}{2}$ -h.p. motor.

THE Ardwick Engineering Company, Manchester, are introducing a new design in quadruple-expansion steam engines for marine, motor-car, and other requirements. The engine, which is made in sizes of from 3 to 25 h.p., has balanced cranks, and the feed-circulating and air pumps are worked direct from crossheads. It is described as being of very compact design, and as light as possible consistent with strength.

THE Auto Stage Co. has been organized at Chicago, Ill., with a capital of £2,000.

LA COMPAGNIE GÉNÉRALE DES AUTOMOBILES LIVREURS, of 114 Rue de Provence, Paris, is increasing its capital from £8,000 to £20,000.

THE Standard Motor Carriage Company is the title of a new concern which has just been formed at Portland, Me., to manufacture motor-carriages. The capital is £100,000.

MESSRS. C. ROUXEL & Co. is the name of a new firm which has just been formed at Boulogne (50 Rue du Château), with a capital of £1,200, to manufacture motor-vehicles.

WE understand that the Meyrick Cycle Company, of 47 Holdenhurst Road, Bournemouth, is now catering to the wants of automobilists by carrying a stock of petrol and other motor-car accessories. The Company is also, we learn, in a position to undertake small repairs to motor-vehicles.

THE Columbia and Electric Vehicle Co., of Hartford, Conn., U.S.A., is stated to have acquired the plant of the New Haven Carriage Co., which will be used for the manufacture of automobile “bodies.” The purchase price is said to have been £40,000.

THE local authorities of Bar Harbour, Maine, have adopted an ordinance confining automobiles to the side streets and dark alleys of that resort. At the last moment it was discovered that the law also affected the steam road-roller owned by the town, and an exempting clause was inserted!

THE recent race between Mayence and Coblenz and back, organized by the West German Automobile Club, proved very successful. In the carriage section the winner was Herr De Dietrich, his time being 4 h. 39 m. 15 s. The first motor-tricycle home was that of Herr Kirchheim, who occupied 5 h. 12 m. 30 s. for the journey.

## LE TOUR DE FRANCE.

IN our last issue we published a table showing the times of the different contestants in the motor-carriage class in the recent Tour de France race. We are now able to give the times of the competitors in the other two classes—motor-cycles and voiturettes—who succeeded in making the whole journey. In the first-named category there were twenty-five starters, while only nine finished. Of the four voiturettes which started only three completed the journey. The average speed of the winner in the motor-tricycle class (M. Teste) works out at no less than 27.85 miles per hour, and that of M. Gabriel in the voiturette class at 20.8 miles per hour. The prizes aggregated £1,156, out of which sum a prize of £240 is awarded to M. R. de Knyff, £100 to M. Teste, and £100 to M. Gabriel.

## MIDLAND MOTOR NOTES.

By "VERAX."

## A Volunteers' Motor-Car.

ON Monday last the prize shooting of the Warwickshire Volunteers took place in the famous Stoneleigh Deer Park, the residence of Lord Leigh, who is always most generous in placing his parks at the disposal of the public. For many years the Volunteers have looked upon this as their camping ground, and next Saturday is the beginning of their camp week. Those members of the Automobile Club who took part in the last Whitsuntide tour in Warwickshire will remember the drive they enjoyed on Whit-Monday through these lovely parks. They are about six miles from Coventry, and on the occasion of this shooting match Lieutenants A. and W. Du Cros, accompanied by Captain B. Luke, repaired thither in the splendid Peugeot car owned by them, and Captain Luke succeeded in winning one of the prizes, so that the car could not, as some antagonists would have it, have shaken up his nerves very much. Rather, the reverse.

## The Hot Weather and Motoring.

AGAIN the weather has been very hot lately, and, as those who have had the opportunity to experience the lovely cooling effect of a motor-car drive must confess, there is nothing to equal it as a stimulant when under other conditions it is almost too hot to breathe. It was not far from the park—namely, at Stoneleigh village—that the first motor-carriage seen at the head of foxhounds appeared.

This car was a Benz one, and contained Mr. and Mrs. Valentine. Although there were over four hundred horses and carriages—not to speak of hunters—at the meet, not a single horse shied at the motor, which came in for a great deal of admiration despite the adverse conditions.

## The Bucks Otter Hounds.

THERE have been several meets lately of the hounds in this district, and motor-cars have been requisitioned to convey members to the meets. Shipston was one of the starting places, a distance of 32½ miles from Coventry, the time of the meet being fixed at 6 a.m. One of the Humber "quads" was driven from Coventry, leaving at 3 a.m. and arriving at Shipston at 4.45 a.m.—a very good performance indeed. The Raglan car went down the previous evening with Mr. C. Junall and Dr. Smith and driver. The speed was not so high as the former light car, but the performance was a very good one, and no accident was reported on either car. The neighbourhood of Shipston is very hilly, there being some gradients of about 1 in 6 to be encountered, and some of them nearly a mile in length.

LORD ARCHIBALD DOUGLAS is the latest convert to automobilism, having just purchased an English-built Hurler from the London Autocar Co., of Gray's Inn Road, London.

THE Riker Electric Vehicle Co. has started up their new factory at Elizabethport, N.J., and by October 1st it expects to be turning out five vehicles a day, including all kinds, from the light runabout to the heavy truck.

WE understand that a new type of petroleum-spirit motor is about to be put on the market by Messrs. Hurst & Lloyd, engineers, 257 High Holborn, London, W.C. For the moment we are only able to state that the new motor is to be made in sizes from 2 h.p. up to 6 h.p., the latter having double cylinders. We are promised further particulars of the new engine, which will be published in due course.

THE Riker Electric Vehicle Company, America, have just introduced a new type of Riker delivery wagon, having wooden wheels. The wheel base is 68 in. and the tread 59 in. The solid tires are 2½ in. by 38 in. diameter front and 42 in. rear. The weight of the vehicle is 3,600 lb. and its carrying capacity 1,000 lb., in addition to the operator and delivery man. Two motors of 2 k.w. each are used. The controller gives three speeds ahead and two reverse, the maximum being nine miles per hour. The total mileage on level macadam roads on each charge is 30. The usual combination voltmeter and ammeter and electric side-lights are employed.

## ON THE ROAD.

### A COMMERCIAL TRAVELLER'S JOURNEY OF 4,750 MILES ON A MOTOR-TRICYCLE.

[SPECIAL INTERVIEW.]

**A**MONG the many changes that the nineteenth century has witnessed none have exercised so great an influence as the difference in the mode of travel. In the old days the "commercial" carried most of his goods as well as his samples on his pack-horse, and trudged from town to town without thinking of trains, time-tables and other complexities of the railroad. Having finished his calls in a town, he would proceed in his leisurely fashion without ceremony or bustle. The railroad changed all that and quickened the wits of everybody, so that for many years now commercial travelling has been done at high speed, although, as "the train waits for no man," long and tedious are the delays often caused in rather out-of-the-way places by waiting for trains, especially if some talkative customer has led to the sight of the rear end of the train just gliding out of the station. The success of the automobile promises a return to the old highways by the new method of locomotion, with, of course, a higher rate of speed than was possible on the packhorse or its immediate successor—the gig.

MR. ARTHUR GOODWIN "ON THE ROAD."

Photo by

Messrs. Reinhold Thiele & Co., London, W.C

Mr. Arthur Goodwin has just demonstrated the possibility of such a notion, and must be hailed as a pioneer so far as the use of the motor in commercial travelling is concerned. In the interests of the Ormonde Cycle Company he has just completed 4,750 miles during the present year, the whole of the journey having been accomplished on a motor-tricycle made by the Motor Manufacturing Company, Ltd.

The test has been a severe one for the motor-tricycle, and that it has been successful is proved by the absence of mishaps and the appearance of Mr. Goodwin after motoring in the snowstorms of last March and the heat waves so recently experienced. The present year has enabled a test to be made that must be regarded as thoroughly establishing the reliability of a British-made motor-tricycle both for winter and summer use. Certainly Mr. Goodwin has concluded a record "commercial efficiency" test in splendid style, and is quite enthusiastic. We were chatting the other day over the

trip, and I asked him to briefly tell the impressions he had gained.

"Well," said he, "in the first place I thoroughly enjoy the motor-tricycle as a means of getting about. When in town I come up to the city from Hanwell, where I reside, on my motor-tricycle, and the ride always sets me up for the day. And it is just the same when away. There is a freshening and exhilarating effect in motoring quite different to that felt after being cooped up in stuffy trains with five a side and the thermometer showing 92 degrees in the shade. That may be a sentimental reason; but the practical ones are those that are most valuable, and they are on the ground of general convenience and saving of time. For instance, I did a southern journey that, by ordinary travel, would have taken two months or more, in seven weeks; and I suppose the actual saving in time would be quite a day a week."

"But I suppose the general convenience is after all the great thing?"

"You would think so if you had seen me calling on clients in half a dozen towns a day, or seen a commercial friend wending his way to a station to wait a couple of hours for a train to a town near by while I scuttled along and finished my call before his train arrived. Then, suppose you know a train is due in half an hour, the tendency is to hurry your customer and very often spoil your business, whereas with my motor-tricycle I am able to complete business in a proper way without confusion and fuss."

"And where, Mr. Goodwin, did you motor your way?"

"Well, my first journey was eastward, through Essex, Suffolk, Cambridge, Lincolnshire, and Hertford, back again to London, encountering very few hills, and in the Fen district the flatness became almost monotonous. My motor-tricycle seemed quite a novelty in the Eastern Counties, where motor-cars are becoming familiar, thanks to the enterprising service of Mr. Frank Morriss (the local agent of the Motor Manufacturing Company) at King's Lynn, the service at Clacton, and the many private vehicles now owned by the gentry round about; but the motor-tricycle seemed new, from the observations hurled by rustic watchfuls as I went along and the comments I heard in towns. In most places my tricycle was an introduction to customers, and in the commercial rooms of the hotels I was regarded at first with curiosity, and later with respect—both as to my means of locomotion and foresight in adapting it."

"Did you find any real interest in the new locomotion from your brethren on the road," I queried, "for such a journey should produce many imitators?"

"Yes, wherever I went questions as to cost, maintenance, convenience, reliability, etc., had to be answered, and I expect that on my next journey that way I shall encounter many motorists, for the roads were capital, and no difficulty presented itself as to housing my machine. That was generally done at the hotel, and I could always get it cleaned without difficulty."

"What of the petrol?"

"No trouble at all. Cycle agents and others are recognizing the commercial possibilities of the new movement, and even where I could not get it by purchase I was generally able to dig out some motorist willing to give me from his store and send me on my way with a replenished stock. Even in the distant outlandish and secluded little places in Cornwall I never failed on that score. Of course, I carried a good supply, but was careful never to overburden myself. I found that  $1\frac{1}{2}$  gallons of petrol and 3 pints of lubricating oil were sufficient reserve to carry me on any journey, and should never advise travellers to encumber themselves with more. With that quantity they should never be 'hung up.'"

Recognising the satisfactory behaviour of the motor-tricycle, I wanted some incidents of the journey. Unfortunately, from the journalist's point of view, these were few—no pitching into ditches by moonlight, no chasings by the county constabulary, no appearances before magistrates and huntsmen, no sticking on hills, and, as Chevalier would

say, "no nuffink." Mr. Goodwin's conduct as a motorist seems to have been as exemplary as the conduct of his machine. During the whole of his ride of over 4,700 miles he was never stopped by the police, never cautioned, never had so much as a warning finger held up to arrest the even tenour of his way. In fact, the only noteworthy incident in connection with police or other authorities which has ever happened to Mr. Goodwin occurred in the City of London, where he received the compliments of a Police Inspector on his skilful manipulation of the machine, and so avoiding injury to a foolhardy pedestrian who ran into harm's way.

"The weather," said Mr. Goodwin, "gave me the most adventure. I went through all the snowstorms in March, and the toughest and coolest run was from Thetford to Bury St. Edmunds. I had the snow pelting my face all the way, and when I arrived at the hotel I might have posed as one of Nansen's men, for the snow had caked on my clothes to a depth of two or three inches. I could not be brushed down in the ordinary way, and Mr. Boots, with the aid of a scraper, was able to chip bits off until my clothes were sufficiently freed from ice to allow me to venture upon a carpeted floor."

"Once," continued the interviewee, "I was delayed by the snow, but only once. As a rule, I ploughed my way through the snowdrifts that accumulated in some of the sequestered lanes with as much success as Makaroff's 'Ermack' goes through the ice of the Baltic. It was a pleasurable experience, although having a tendency to vainglory, to see a horse-drawn vehicle labouring through the snow, whilst my machine overcame all difficulties. Perhaps the worst storm I encountered was when going from Cambridge to Bury St. Edmunds. Several confreres at the University town urged me to wait till the storm had abated, but I meant to push on to test the capabilities of the motor and to see how it would behave. So on we went—my motor and I—right through Newmarket, where the few stable lads hanging about regarded us with almost scornful disdain. Three or four miles from the famous Heath the first stop took place. Something had gone wrong with the motor, and an examination was necessary. Everything seemed all right, and the only solution I could find was that the snow had caked in the various joints, and the moisture had got to the wires and established short circuiting. But after clearing away the unfortunate accumulation of ice, I resumed my journey, going along as comfortably as before, after having discovered a cobbler's shop, and there obtained some wax with which I covered the whole of the exposed portion of the connections thoroughly. No further trouble arose from that cause, although I met with many more snowstorms and encountered many heavy rains."

The second long journey indulged in by Mr. Goodwin after many "home-in-a-day" runs from London to all the towns in the home district, was through Oxford, Buckinghamshire, Warwick, Gloucester, and North Wilts, with plenty of stiff hills to negotiate. Only on one or two occasions were gradients found that necessitated help being given the machine by the pedals. The longest journey, and one which gave the best variety so far as roads were concerned, was a run from London right round the coast from Kent to Cornwall, and then along the shores of North Devon to Bristol—back again *via* Bath and Devizes. This was during the recent hot weather, and it must have proved exhilarating mounting Shooter's Hill, Boughton Hill, Chatham Hill, and the other elevations met with.

"I got to Dover," said Mr. Goodwin, in continuation of his narrative, "on an auspicious day—the inaugural trip of a service of motor 'buses between Dover and Kearsney—and enjoyed a champagne supper at the expense of a sceptic who believed not in the ability of my motor-tricycle to mount Castle Hill. We wagered—I do not know whether the spot was a 'place' within the meaning of the Act; and I toiled up that hill, where motorist had never been before. It was steep, and the way back would have been sharp and short. Towards the top I had to pedal for that champagne supper

for all I was worth. The sentry was quite as surprised as my friends—and but for my recognised English might have called the guard, fearful lest I might have been a 'dare devil Frenchman.' This, at least, says something for the hill-climbing capabilities of the machines made by the Motor Manufacturing Company."

Motorists to some of the southern seaside resorts have complained of tolls. Mr. Goodwin is strong on that point—and on signposts.

"Across Romney Marsh," he said, "the signposts might have been erected in the darkness of a December evening. They are as confusing as the Maze at the Crystal Palace, and thanks to following their instructions I lost my way. Travellers in this district should do as I had to ultimately, and follow their instinct, leaving signposts to the native. But worse than the bothering signposts are the iniquitous tolls which crop up in the most unexpected places and rise to most unjustifiable heights. At Rye I was charged 1s. 3d.; at Littlehampton the toll for the motor carried across a floating bridge was 1s. 3d., and over Bursledon Bridge between Portsmouth and Southampton it was 1s. 3d. I have since ascertained that these charges were 3d. and 6d. above the proper rates, so would sound a note of warning to others to be careful that they are not overcharged."

"I suppose these tolls were really more than the cost of getting your motor-tricycle from Portsmouth to the Island?"

"Yes, considerably. By the way, I may claim to have been one of the first tricyclists to motor over the Isle of Wight, and a most enjoyable run it was, although the roads were rather loose in some places and very loose in many more. Some of the hills, too, required careful negotiation. From Ryde I went to Ventnor, and then, *via* Sandown, Yarmouth and Newport, to Cowes, the little commercial centre of the Island, which preserves its beauty very well, despite the trippers and holiday-makers it has had to entertain for many years past."

Business, according to Mr. Goodwin, had been good all along the coast, and the fact that he was successfully manipulating a motor served to draw attention to its merits from many prominent folks, both in the cycle trade and among the horse-owning gentry. An interesting instance of this occurred at Arundel.

"All who know Arundel," continued Mr. Goodwin, "appreciate the steep hill which rises from the centre of the town. I managed to mount this without difficulty, and on turning to my right at the top found myself in the grounds of the Duke of Norfolk. Several masons were at work making additions to the castle, and at a little distance were two or three gentlemen evidently interested in the operations. As I entered the grounds they came near, and closely examined my machine. I was of quite secondary interest in view of the motor-tricycle, whose capacity, work, cost, and other incidentals had to be fully elucidated. Evidently something more than interest was aroused, and I shortly learned that one of my audience was the Duke of Norfolk, whose recognition of the motor as a means of locomotion has been seen in the Postal Service."

Surely there should be some fine opening for motor-car services along the south coast, and for the summer season of 1900 Mr. Goodwin has some suggestions based on his personal observations of the visitors he met, the localities he journeyed through, and the roads over which he rode so easily. Of course, there were several towns where these are already doing good business, and, besides the Herne Bay to Canterbury service, many towns have lately granted licences. Folkestone to Sandgate ought to prove a profitable course for such a service, while from Southampton to Winchester is another.

"But what is really wanted is something apart from the ordinary running to and fro," says our 'motoring commercial,' "and I would suggest that, with Southampton as a centre, trips might be made into the New Forest. Looking further west, a motor-car service about Barnstaple, Bideford and Clovelly ought to pay, while between Ilfracombe,

Lynton and Lynmouth is a splendid opportunity. Inland many chances for good services are presented, and the Great Western Railway might materially increase the popularity of their day trips into Shakespeare's country by running a motor-car service in connection therewith, enabling tourists to see all the haunts of the great poet round about without fatigue and loss of time. Many of these services, of course, would be for the summer only; but that hardly detracts from the desirability of their establishment, for in England we have to 'make hay while the sun shines,' and the sun has been shining a long while this year."

But after all Mr. Goodwin's journey was for purposes of business, and going along to Bournemouth, and from thence *via* Dorchester, Weymouth, Dorchester, Sherborne, Yeovil, Crewkerne, Chard, Axminster, Honiton, Exeter, Exmouth, Teignmouth, Newton Abbott, Torquay, Totnes, Plymouth, Devonport, Saltash, Liskeard, St. Austell, Truro, Falmouth, Helston, Penzance, Hull, Redruth, Bodmin, Launceston, Clovelly, Bideford, Barnstaple, Ilfracombe, Lynton, Lynmouth, Minehead, Watchet, Porlock, Bridgwater, Weston-super-Mare to Bristol. He found many loose and dusty roads in Devon and Cornwall. Along the route already indicated, he gave another demonstration of the value of his motor-tricycle, and although on one day the electric sparking beat him for half an hour owing to a break in the insulation of the wires for which he could not account, the journey was eminently agreeable and no other difficulties were encountered. Many cycle firms visited by Mr. Goodwin are so satisfied with the prospect of the demand for motor-tricycles increasing during the coming year that they have decided to take up the sale of these machines, and will doubtless look for custom among commercial travellers, while the Ormonde Cycle Co., will shortly enter upon the manufacture of motor-tricycles. Throughout the 4,750 miles he has gone this year for business purposes Mr. Goodwin has only experienced vibration to any really appreciable extent when he had to put in a lengthy spin at a good pace over bad roads.

During his journey Mr. Goodwin's kit was carried in a "hold all" on the handle-bar, and sufficiently large to contain a complete change of apparel. On the back of the tricycle was a leather wallet, with waterproof, writing case, etc.; the tool bag (containing, of course, a complete set of appliances) being fastened on the axle bridge. In fact, everything necessary was carried, and the traveller on his machine was independent of carriers and railway companies.

On most of his journeys Mr. Goodwin employed low gearing, and with such his best speed has been 22 to 23 miles per hour. With a higher gearing he has done 28½ miles in the hour.

The man who can withstand snow and sun within such short times as we get in England and accomplish such a journey must have stamina, and were he to go in for motor racing ought to do great things. But Mr. Goodwin prefers, as yet, to restrain himself, being content with his already valuable demonstration of the use of the motor-tricycle. As an old cyclist—a winner of twenty first and eleven second prizes in open events in 1890, as well as minor prizes, club medals, etc.—he knows something of the track, so he appears equally at home there as on the road.

As a result of his experience he is determined to continue the use of the motor as a means of transportation in future business peregrinations; and on every point of concern, such as convenience, saving of time, etc., can assure travellers thinking of motoring that it leaves the old-fashioned railway travelling far behind. All he insists upon is that if a motor-tricycle is employed on lengthy country journeys the user should satisfy himself that he is purchasing a reliable machine, such as Mr. Goodwin has himself purchased from the Motor Manufacturing Company.

ON Thursday last one of the latest pattern Thornycroft steam lorries was shipped from Liverpool to Messrs. Guinness', the well-known brewers of Dublin. The vehicle is designed to carry 3½ tons.

## FURIOUS MOTOR-TRICYCLING AT GUILDFORD.

JOHN DENNIS, of Guildford, was summoned last week for driving a motor-tricycle in the High Street furiously, to the common danger of passengers, on the 12th ult. Mr. T. Wainscot appeared for the defendant, who pleaded not guilty. Sergeant Hall stated that he was in Friary Street, close to Mr. Allen's shop, about 12.10 (noon) on the 12th ult., when he saw the defendant pass on a motor-tricycle from the direction of the bridge up the High Street. He was going at a very furious pace, quite sixteen miles an hour. Witness hastened to the end of Friary Street, and defendant was out of sight, but on getting into the road he saw defendant by Swan Lane, going at about the same pace, or somewhat slower. He went up the street and met the defendant returning rather slower. He questioned him as to why he was going at such a pace, telling him he thought he was going twenty miles an hour. He said, "Oh, no; I was not, I was going about eight." He told him he could say for certain he was going at sixteen miles an hour. Mr. Wainscot: Do you know, as a matter of fact it is a difficult matter to get motor-tricycles to go up the High Street?—Witness: I have seen a motor go up the Mount with four or five people in it. Mr. Wainscot said he would call witnesses to

FIG. 13.—THE HILL-CLIMBING CONTEST—THE LEYLAND STEAM LORRY  
(See page 343).

prove that defendant, when passing Friary Street, was not going more than eight miles an hour. It would be impossible to get up a speed of sixteen miles on a machine of that kind after the defendant had pulled up twenty yards at the most from Friary Street. He would prove that it would take a distance of about eighty or 100 yards to work it at that pace on a level road. He then called the defendant, who stated that he was on a new motor-cycle and came down from the bridge at about five miles an hour with the machinery off. When the machinery was off it acted as a powerful brake. His intention was to pull up altogether at his shop, but he altered his mind and switched the current on. On passing Friary Street he had increased the pace by a mile or a little more, and it was ridiculous and impossible for the motor to go twelve miles an hour in so short a distance. Mr. Wainscot called five other witnesses in support of his case, and the magistrates retired to consider their decision. On their return the Mayor said they had come to the conclusion that although the motor-tricycle was not going sixteen miles an hour, the pace was dangerous to the public. They must therefore convict, and defendant would be fined £1, including costs.

## MOTOR-CAR COMPETITION AT NEWBURY.

THE Newbury Guildhall Club held its second annual gymkhana in the grounds of Shaw Avenue, Newbury, on Wednesday, the 26th ult. A feature of the programme was the motor-car competition, for which there were no less than nine entries, the vehicles including several makes and attracting much attention. Prior to proceeding to the grounds, the cars were driven into the Corn Wharf, under the superintendence of Messrs. Stradling and Plenty, the local agents for this class of conveyances, where photographs were taken, after which they moved off in single file, headed by Mr. Stradling's comfortable Benz Ideal car, the route taken being the Market Place, Cheap Street, Railway Station Road, Bartholomew Street, Northbrook Street, and London Road to the ground, the entire distance being covered in ten minutes. The competition comprised:—1st, General driving, one lap at a moderate pace; 2nd, starting and stopping at a given signal from the judges; 3rd, driving through obstacles (the same as those which figured in the arena at the recent exhibition at the Agricultural Hall); and 4th, speed driving, one lap. The winner of the contest was Mr. Stradling, who drove his Benz Ideal car.

## SALES, WANTS, Etc.

[All Advertisements under this heading will be inserted at the minimum rate of 1s. 6d. for 18 words and thereafter at the rate of 1d. per word per insertion, but on no account will any Advertisement be inserted unless prepaid.]

FOR SALE.—Second-hand Benz Cars, with latest improvements, and English improvements; satisfaction guaranteed. Also Tricycles and other makes of Cars.—A. Valintine, 4 Heath Terrace, Leamington Spa.

WANTED.—Second-hand Benz Cars, any number. State age, condition, where seen, and lowest price.—A. Valintine, 4 Heath Terrace, Leamington Spa.

THREE MOTOR DELIVERY VANS, to carry 15 cwt. to 1 ton; from £80 to £150.—Apply Frank F. Wellington, 36 St. George's Sq., Regent's Park, N.W.

DE DION QUADRICYCLE, with British Motor plate, in perfect running order, equal to new, spare wheel for using same as tricycle, 1½ h.p.; price £80.—Apply Frank F. Wellington, 36 St. George's Sq., Regent's Park, N.W.

INTERNATIONAL BENZ SOCIABLE, to seat three, equal to new, in perfect working order; price £130.—Apply Frank F. Wellington, 36 St. George's Square, Regent's Park, N.W.

DE DION TRICYCLE, 1 h.p., in perfect running order; £30.—Apply Frank F. Wellington, 36 St. George's Sq., Regent's Park, N.W.

TWO WERNER MOTOR-BICYCLES, perfect running order, price £20 each.—Apply Frank F. Wellington, 36 St. George's Sq., Regent's Park, N.W.

TWO BOLLEE VOITURETTES to be Sold cheap.—Apply Frank F. Wellington, 36 St. George's Sq., Regent's Park, N.W.

RACING ASTER MOTOR-TRICYCLE, speed 37 miles per hour.—Apply Frank F. Wellington, 36 St. George's Sq., Regent's Park, N.W.

DAIMLER WAGONETTE, 5½ h.p., very fine car, to carry six.—Apply Frank F. Wellington, 36 St. George's Square, Regent's Park, N.W.

PANHARD AND LEVASSOR WAGONETTE, to carry eight, perfect running order, fitted with spare 'bus top for winter use.—Apply Frank F. Wellington, 36 St. George's Square, Regent's Park, N.W.

DAIMLER MOTOR-LORRY, to carry 30 cwt., equal to new; to be Sold cheap.—Apply Frank F. Wellington, 36 St. George's Square, Regent's Park, N.W.

DE DION MOTOR, 1½ h.p., with carburettor and exhaust box; to be sold cheap.—Apply Frank F. Wellington, 36 St. George's Square, Regent's Park, N.W.

DE DION TRICYCLE, fitted with front seat for carrying two, 1½ h.p.; price £45.—Apply Frank F. Wellington, 36 St. George's Square, Regent's Park, N.W.

FOR SALE.—Second-Hand Benz Motor-Car; recently fitted with Connolly Tires, and is in really good order; price £120, a bargain.—Reply No. 69, *Motor-Car Journal*, 39-40 Shoe Lane, London, E.C.

MOTOR-CARS, both new and second-hand. Immediate delivery. Price and full particulars—The Luton Motor-Car Co., Park Square, Luton, Beds.

FOR SALE.—Daimler Car Wagonette, nearly new, little used, painted yellow, 5½ h.p., to seat six or seven; £300.—John Kirsten, Southborough, Tunbridge Wells.

WANTED, first-class Car, to seat four, for private use; Panhard, Peugeot or Mors preferred, with solid tires. Must be up to date and bear inspection.—Fletcher, Hansler Grove, East Molesey.

APPRENTICES WANTED.—No premium, no wages.—Apply Frank F. Wellington, 36 St. George's Square, Regent's Park, N.W.

ADVERTISER, aged 22, 6½ years' workshop experience in gear and motor work, good technical training, desires Berth with Motor Firm; workshops, drawing office, or depot.—"B," 70 Hyde Vale, Greenwich.

## Trade Announcements.

[All Advertisements under this heading will be inserted at the minimum rate of 2s. 6d. for 30 words and thereafter at the rate of 1d. per word per insertion, but on no account will any Advertisement be inserted unless prepaid.]

PLATINUM.—Used Ignition Tubes Wanted, and Platinum Scrap of all kinds Purchased; best prices by Derby & Co., 44 Clerkenwell Road, London, E.C. Established 1797. 24

MOTORS ON HIRE.—Daimlers, Panhards, Benz, New Beestons, etc., in good order, by day, week, or month.—The Yorkshire Motor-Car Co., Ltd., Bradford.

TRANSFERS FOR MOTORS.—A single sample supplied with your own wording to order, gold and two colours, art designs.—Send P.O. 2s. 6d. to George Malton, Motor Transfer Works, Upton Park, Essex.

## TO CORRESPONDENTS.

All communications intended for insertion in this Journal or relating to Editorial matters should be addressed to THE EDITORIAL DEPARTMENT, MOTOR-CAR JOURNAL, 39 and 40 Shoe Lane, London, E.C. Letters must in all cases be accompanied by the name and address of the writer, as no notice will be taken of anonymous communications.

The Editors cannot undertake to return MSS. or drawings, although every effort will be made to do so in the case of rejected communications. Where such are regarded as of value, correspondents are requested to retain copies.

The Editors do not hold themselves responsible for the opinions expressed by their correspondents, or for statements and facts which do not appear in the editorial columns.

The Editors and Publishers beg also to state that they will accept no responsibility for unsolicited contributions, even if used, unless payment for same is directly specified in forwarding, and the terms arranged before publication.

To insure insertion communications and contributions must be in the Editor's hands by Wednesday forenoon of the week in which the same are intended to appear. Disappointment may be caused by non-compliance with this rule, and to avoid this earlier receipt, if possible, is necessary.

# THE Motor-Car Journal.

Vol. I.]

LONDON, FRIDAY, AUGUST 11th, 1899.

[No. 23.]

Published Weekly by CORDINGLEY & CO., 39 & 40 Shoe Lane, London, E.C.

## COMMENTS.

### Motor-Cars in Parliament.

IN the House of Commons on Thursday last week Mr. Tritton asked the President of the Local Government Board whether his attention had been called to the numerous accidents that had lately been caused by motor-cars; and whether he would take steps to compel all drivers of motor-cars to stop until horses and carriages had passed when requested to do so by the persons in charge of them. Mr. Chaplin, in reply, said: "No representations have been made to me as to numerous accidents caused by motor-cars, and ample powers are given already under regulations made by the Local Government Board to give effect to the object of the hon. Member. The article provides that every person shall, on the request of any police-constable or of any person having charge of a restive horse, or on such constable or person putting up his hand as a signal for that purpose, cause the light locomotive to stop and to remain stationary so long as may be reasonably necessary."

### A Detachable Motor-Car Chain.

ONE day last week we received a visit from Mr. A. Pearse, of Hampstead, N.W. The object of his call was to show us a new rivet he has devised, by means of which every link of a motor-car chain can be instantly detached. The rivet is a compound one, being made up of two parts, one fitting in the other. The inner one has two spring tongues, which, when inserted in the outer hollow rivet, open out and form a rigid connection. In the sample shown us the rivets were loose in the outer side plates, but Mr. Pearse states that the connection between the two can be easily made quite as rigid as in the ordinary motor-car chains. The idea of a detachable chain, if it can be made as durable as the ordinary type, is, of course, a good one, as then the operation of taking out a link after the chain has worn is greatly facilitated. Mr. Pearse is, we understand, anxious to arrange with a chain-making firm to take up his new rivet.

### A Motor-Car Aids the Police.

ALTHOUGH it must be said that motor-cars, or rather their owners, have hitherto received but somewhat questionable treatment at the hands of the police in various parts of the country, this has not prevented an automobile vehicle from performing a new office, viz., that of assisting the police in capturing a man who was endeavouring to escape arrest for assault. The man, a waiter named Warmingham, visited a hotel at Stonebridge, near Birmingham, in a state of drunkenness, and as he refused to leave the proprietor had to use physical force. In the struggle the latter met with injuries through being thrown down by Warmingham, who tried to get away by boarding a carrier's cart. The prosecutor, however, followed in his motor-car, in which there was also a policeman, they eventually succeeding in placing the assaulter under arrest.

### English Automobile Progress—From a French Point of View.

THE Editor of *L'Avenir de l'Automobile et du Cycle*, of Paris, who was a visitor to the two recent English motor-car exhibitions, has returned home with a very high opinion of English-built automobile vehicles. In the last issue of his journal he states: "The progress which is being made at the other side of the Channel is worthy of more than passing notice. English builders are making rapid strides, and the time is not far distant when they will be able to offer motor-vehicles and cycles at prices at which French builders will not be able to compete; indeed, they already have several types of electrical vehicles which require a lot of beating."

### An Editor's Confession.

THE Editor of the *Stable and Kennel* has made a confession. Referring to our recent surprise at his continual growls against automobilism, our contemporary declares, "We have no prejudice against the motor-car," and then goes on to speak of it as a good thing in its place. It appears that, after all, the *Stable and Kennel* is not so much afraid of the motor-car as of the "reckless Juggins who can afford to pay the price or hire it." We quite agree with our contemporary in insisting upon proper safeguards for the public safety, and believe that in giving publicity to new ideas that are making for mechanical perfection, and in encouraging tests of reliability rather than of wild and wanton speeds we are doing more for the public than if we were continually grumbling at the present state of things. But we are glad to see, and heartily acknowledge, the kindlier tone with which the *Stable and Kennel* treated the motor-car last week, and hope it will long continue in such a mood.

### More Motor Etymology.

A good deal of time and energy is just now being wasted in America on the question of suitable terms for automobile vehicles. The latest suggested name is "autobaine," "baine" being derived from an old Greek word, meaning wagon. Taking the word "autobaine" as a base, the gentleman who has brought it forward further suggests "autobaineer" as the name for a gentleman driver, "autobaineeress" for a lady operator, and "autobaining" or "autobaineering" for the act of using the vehicle.

### "To-Day" on Motor-Tricycles.

A WRITER in *To-Day* remarks that "It seems as if there was going to be a boom in motor-tricycles. A few months ago they were comparatively rare; now I see so many of them daily that I am compelled to recognise this fact. I hear that several business men have started them, and make their daily journey into the City on them. Also I have heard of one residing at Hampton who has dropped the railway and comes in to business on a motor-tricycle. The fact is the advantages of them are great." It is satisfactory to find the general press being thus slowly

but surely "converted" to automobilism. There are, however, a number of journals which are still very much anti-automobile. They have still to learn the advantages of motor-vehicles. When they do, as do they must sooner or later, it is to be hoped that they will give them their support to the same extent as they are just now endeavouring to mar their progress.

#### Something Wonderful from Australia.

WE have this week received a copy of an Australian cycling paper in which reference is made to the experiments in the way of motor-vehicles made by Mr. H. Austin, of Fitzroy, N.S.W. This gentleman has been at work for the past three years constructing a motor which he claims will create a stir in the motor world when completed. Our contemporary states: "The new idea will, it is estimated by Mr. Austin, weigh only about 1 cwt., and will be of such simple construction that it will have no mechanism to get out of order, the only moving parts being practically the piston and the gear wheels. How this is to be done Mr. Austin is

THE LIVERPOOL HEAVY-VEHICLE TRIALS.—VIEW IN YARD BEFORE THE START.

Photo by

Mr. Fred Rowcliffe, Manchester.

not yet prepared to state, but he expects to be able to construct a car that will carry four persons, and go from Melbourne to Bendigo in three hours, using only about five pints of gasoline for the trip. The inventor reckons that when perfected he will be able to turn out a car at a cost of £35 that will run 100 miles with two passengers at a working cost of threepence." We shall look forward with interest to further particulars of the Austin motor-car.

#### Electrical Vehicles in Canada.

WE learn that the Still Motor Co., of Toronto, Canada, is arranging to build Still storage batteries and motor-carriages on a large scale both for the Canadian market and for foreign trade. The Company has recently completed a motor delivery wagon for Messrs. R. Parker & Co., Toronto, which is described as being neat, light and easy-running. The wagon is equipped with an 8-h.p. motor and a battery of thirty-six cells, the total weight of which is 486 lb.; the complete vehicle ready for running weighing about 1,200 lb. The range of the battery without recharging

is about forty miles, and the speed can be regulated from three to fourteen miles per hour.

#### "The Road" and Motor-Cars.

WE are glad to note that *The Road* is setting an example to many journals by regarding motor-vehicles in a reasonable light. In its last issue our contemporary publishes an article dealing with an extensive motor-car tour in Devonshire and Cornwall. In commenting on the article our contemporary states: "Apart from the sentimental value attached to an undertaking of this character, it disposes once and for all of the silly statement made by certain individuals that the motor-car is ridiculous and impracticable. It stands to reason that a tour which can extend over 600 miles over some of the very worst and most precipitous roads to be found in the Kingdom, and with no more serious breakdown than a split strap or a defective water-jet, must rank as no mean achievement. A journey of this length and 'over such a route' is a valuable and efficient test of what a motor-car can and cannot do; and, so far as we know, this expedition has never been equalled. That the motor-car is on the high road to achieving a lasting place in everyday life cannot any longer be denied."

#### "Marks" on Motors.

THE above is very interesting reading—especially as it appears in a publication belonging to Mr. P. Marks, a brother of Mr. Harry Marks, M.P., the Editor of the *Financial News*. We think our readers will appreciate the praise more highly when they learn that it was Mr. Harry Marks and his secretary who were the tourists in question; so that while in one publication it is thought necessary to do all that is possible to vilify motor-cars, yet in the other no praise is too high when speaking of their merits. Referring to the recent articles in the *Financial News* on our Exhibition, we can surely say that it is not automobilism that has gone mad, but rather that in the office of our contemporary a somewhat lax system of discipline prevails, which permits the Editor's opinions of the merits of automobiles to be overridden by some junior on the staff.

#### Bournemouth and its 'Busses.

WHY should Bournemouth lag behind other resorts so far as methods of locomotion is concerned? Mr. A. H. Collier having applied for licences for two motor-cars for public service, the Town Clerk has replied that the Horse Committee of the Town Council will inspect the cars. At the meeting at which this inspection was mentioned Mr. Gunning suggested that all new licences should be carefully watched, as if the motor-'busses were adopted they might compete with and "nurse" the horse-drawn vehicles in the town, and upset a new time-table which has been lately introduced. Alderman Hiron replied by saying that as the application was made the committee were bound to see the cars, but he hoped Mr. Gunning would vote against them, and he would promise to do the same. If aldermen and councillors have made up their minds to vote against motor-cars, why take the trouble of inspection? This is a specimen of the prejudice which is being opposed to the introduction of automobilism in various places, but which, we are glad to see, has no support in the local press of Bournemouth.

#### The Renault Motor-Tricycle.

IN a letter to us this week Messrs. Marshall & Co., of Clayton, Manchester, the builders of the Hurtu cars in this country, inform us that they have acquired the English patent rights in the Renault motor-tricycle, and are rapidly proceeding with the arrangements for its manufacture.

We referred in our issue of the 28th ult. to M. Renaux's wonderful performance on the Parc des Princes track in Paris. His achievement in the recent Paris-St. Malo race is, however, even more noteworthy, for he succeeded in

THE HILL-CLIMBING CONTEST AT LIVERPOOL—SNAPSHOT EN ROUTE.

covering the distance between the two places (372 kilometres) in 7 hours 11 minutes, his average for the seven hours run being thus over 32 miles per hour.

#### The London Steam Omnibus Company.

THE scheme formulated by Mr. W. J. Hunter, the solicitor who has acted for a number of shareholders in this Company, has been accepted by the litigant shareholders, and the Company issued notice of a meeting of the general body of shareholders to be held to-day (Thursday) at the Hotel Cecil. We are informed the meeting is being called by the present board in pursuance of the scheme, and at it Mr. Bayley, as chairman, will explain the arrangements which have been made. Then the resolutions changing the name of the Company to the Motor Traction Co., Ltd., and providing for half-yearly meetings, will be submitted, and the new board elected. The third member of the new board will be Mr. W. H. Andrews, of the London Tramways Co.

#### A New Beeston Motor-Quadricycle.

WE had a short spin the other morning on a new Beeston motor-convertible quadricycle, and although the road covered was very stony and rough, riding on the front seat was comfortable and free from metallic jar. The construction is a new design, and gives a very long wheel base, thus reducing vibration to a minimum. The capabilities of speed are 25 miles per hour as a single machine and about 20 miles in the double form. The machine can be transformed into a single-seated tricycle by simply unscrewing a few nuts, removing the front portion of the machine and inserting a front wheel.

#### Raising the Speed Limits.

THE trials of heavy motor-vehicles which are being conducted by the Automobile Club of Great Britain on behalf of the Local Government Board with the view of an increase in the limits of the speed of such vehicles weighing unladen over 1½ tons, commence this morning at Richmond. We are sorry to learn that only three vehicles have been promised for these trials, viz., a 3-ton steam wagon by the Steam Carriage and Wagon Co., Ltd., Chiswick, a

delivery van by the Daimler Motor Co., Ltd., and a 2-ton Cannstatt-Daimler lorry by the Motor-Carriage Supply Co., Ltd. The reason for the very few vehicles which have been entered is undoubtedly due in a large measure to the short notice given of the experiments, while the heavy motor-car trials at Liverpool last week may also have caused interference. The successful character of the trials last week, however, should do much to assure the Inspectors of the Local Government Board that immense progress has been made in the construction of heavy motor-vehicles during the past twelve months from every point of view.

#### Motor-Vehicles in Ireland.

THE motor has, to use the phrase of the *Freeman's Journal*, "been steadily gliding into more general use in Dublin," and so far as the large cities of Ireland are concerned it is accepted as a permanent institution in the streets. Even the jarveys, whose early chaff was unmerciful, now admit that the motor-car is something more than a subject for jokes and witticisms. But it does not seem to have yet got far into the country districts, where, of course, it should prove extremely serviceable; and we are glad to notice that our contemporary suggests the motor-car as an alternative for goods and passenger traffic for out-of-the-way districts. While we recognise the usefulness of motor-vehicles in such localities, we are afraid there is hardly sufficient traffic to make a service profitable in more than a few specially-favoured parts of the country.

#### The Pope and Motor-Cars.

LAST week we announced that the Pope had been presented with a motor-car by a French firm, but, on good authority, added that his Holiness had not commenced to ride, confining himself to the carrying chair so long employed in connection with his daily exercise. According to the Rome correspondent of the *Daily Mail* the Pope has, however, since had an experimental ride on his motor-car, with the result that he has become enthusiastic with regard to automobilism, declaring that however agreeable the bicycle may be for young people the motor-car is the vehicle for the old. "So delighted," adds the Rome correspondent, "is he with this form of locomotion that he has allowed himself to

THE HILL-CLIMBING CONTEST AT LIVERPOOL—SNAPSHOT EN ROUTE.

be photographed in his automobile." Could admiration go further? But with every respect for the veracity of our contemporary's representative in the Eternal City we *should* like to see that photograph.

**Catalogues  
Wanted!**

MR. W. R. TURNER, the Ashells, Quorn, Leicestershire, has been alarmed at the pace of some of the motor-car drivers on the road between Leicester and Quorn. "I have been very nearly thrown out of my trap twice," he writes to the local press, "and although I held up my hand when my pony became unmanageable the driver (of a motor-car) deliberately rushed by me at a terrific speed. On the first occasion I only just escaped a serious accident. Rather than risk a third I decided to get rid of my pony, which I did at a considerable pecuniary sacrifice." Mr. Turner is apparently without any means of getting about now he has sold his pony, and we would suggest he should become an automobilist. In any case, manufacturers of motor-cars might send copies of their catalogues to Mr. Turner, who can be assured as to the patience of the motor-car when it meets shyng ponies and other irritating animals.

**Agricultural  
Hall Exhibition.**

REGARDING the 1900 Motor-Car Exhibition to be held at the Agricultural Hall in April, we have pleasure in stating, in answer to several correspondents, that we shall still retain the arena for practising purposes and for the trials of the various vehicles on exhibition. A more elaborate programme of motor-car sports will be arranged and additional prizes given.

**A Long-Distance  
Run by a  
Steam Lorry.**

AN interesting long-distance trial is being made of one of the steam motor-wagons which competed in the trials of the Liverpool Self-Propelled Traffic Association last week, a load of crystal carbonate having been provided by Gaskell & Deacon's works at Widnes. Twenty bags of this article were loaded up at Widnes at midday on Tuesday, consigned to a London firm. The vehicle in question is that of Messrs. Clarkson & Capel, London, its total load being about three tons. This test is the longest yet undertaken in England, and the start was witnessed by Messrs. V. C. Driffield, Max Muspratt, Shrapnell Smith, and other officials of the United Alkali Company. The start was made at 12.40 p.m. on Tuesday, and according to a telegram lately to hand Cannock was safely reached at 5 p.m. on Wednesday. The vehicle is expected to reach London some time to-day (Friday).

**SCOTTISH NOTES.****On Holiday.**

THE fashionable holiday month of August is now with us, and anything in the way of organized motor runs is impossible here, all the good Scottish motorists having betaken themselves to their holiday quarters, and with them of course their favourite motor-carriages. This annual exodus undoubtedly answers an excellent purpose in the way of introducing the motor-car to new places and people, for, as has been found from past experience, the more the "horseless carriage" is known the better it is liked.

**A Long  
Non-Stop-Absolute  
Run.**

EARLY last week I visited Hamilton, and had an opportunity of interviewing the busy managing director of Stirling's Motor Company there. Mr. Stirling had just returned from a business trip in the North of England, and in the course of conversation he informed me that on this trip he had done his longest non-stop run—for of course Mr. Stirling journeyed on his now familiar motor dog-cart, on which he has travelled over 12,000 miles, including his run from Edinburgh to London in two days in June. He left Hamilton at 8.30 a.m., and absolutely without stop he drove

into the City of Carlisle, a distance of 83½ miles, and drew up at the General Post Office at 1.25 p.m., the journey having been accomplished in 4 h. 55 m., or about an average speed of 16½ miles an hour. I have not beside me at the moment the particulars of the longest known "non-stop-absolute" run, which I think was credited to Mr. S. F. Edge on his tricycle, but I believe I am right in stating that it was several miles less than Mr. Stirling's run.\* To Mr. Stirling's previous long-distance records therefore has to be added the "non-stop" record of 83½ miles. Mr. Stirling informed me that his car could not have run another mile more without having a means of refilling the petrol tank while the car was running, or having a larger tank fitted, as after stopping a few minutes at the Post Office the car was driven into the yard of the Red Lion Hotel, and the petrol tank examined, when it was found to be practically dry. The return journey, made a few days later, was, I understand, done in the teeth of a strong head wind, with one momentary stop to relight a burner which was blown out at the most exposed part of the road near Beattock. The time was 5½ hours. I have taken the trouble to record these facts chiefly as an answer to the happily decreasing number of sceptics who still speak of waiting till motor-cars are "practical things." Such performances as I have recorded are enough to more than satisfy every reasonable and unprejudiced mind.

**Strathallan  
Games.**

THIS great highland gathering at Bridge-of-Allan took place on Saturday last, and, as in former years, the motor-car assisted in conveying some of the many thousands of visitors from all parts to the scene of operations, only their number was considerably increased. I counted some half dozen vehicles of the Falkirk Motor-Car Co., three wagonettes from the Hamilton Co., and another from Perth. All of them were well patronised, and their owners appeared to be satisfied with the financial returns.

**Proposed  
Motor-Racing Track  
for Scotland.**

IT is only natural that the immense popularity of motor-racing on the Continent, in conjunction with the increasing interest in everything pertaining to motors in this country, should be exercising a very great influence on the minds of many practical motorists here, and while it is too much to expect the public highways of Britain ever to be thrown open to great motor races as in France, the construction of suitable tracks on which such public competitions can be undertaken with perfect safety to riders and the public alike is a subject worthy of serious consideration. It is needless to refer to the enormous influence which "the path" exerted in the development of cycling, and motor racing on properly built tracks is bound to do the same thing in the development of motoring. I understand that a scheme for the establishment of a motor-racing track is at present under the consideration of more than one prominent Scottish motorist, and in the interests of the motor industry in Scotland I trust the proposal will take definite shape and soon be put into successful execution.

**Automobile Club's  
Autumn Tour.**

MUCH satisfaction is felt in the North with the proposal to have the autumn tour of the Automobile Club in Scotland, and the hope is freely expressed that the proposal will be carried through. Considering the growing interest in an organization or club for Scotland, the committee have acted wisely, I think, in making such a suggestion; and in the name of all Scottish motorists I can assure the members of the great club a most hearty welcome to "bonnie Scotland."

"BROWN HEATHER."

\* "Brown Heather" has apparently overlooked the long non-stop run made by the Hon. C. S. Rolls during the course of the recent Exhibition at the Agricultural Hall. As stated in our issue of July 21st, Mr. Rolls succeeded in performing an absolute non-stop run of 134 miles in 6 h. 42 m.—*Ed. M.C.J.*

## A NOVEL FRENCH ELECTRIC CAB.

—❦—

ONE of the novelties at the recent motor-car exhibition in Paris was undoubtedly the "Autocab" exhibited by Captain E. Draulette, of 3 Rue Collin, Puteaux, Paris, of which we are herewith able to give an illustration. In general appearance the vehicle somewhat resembles a hansom cab; it has, however, four wheels, while the seats are arranged in a semi-circular form, providing ample accommodation for four persons. The entrance to the vehicle is right at the front, between the wheels, the driver being perched up in a high position at the rear.

The accumulators are forty-four in number, of the Fulmen B 13 type, each cell comprising six positive and seven negative plates. The capacity is given as 105 ampère-hours, permitting, it is claimed, a run of five hours, at a discharge rate of 21 ampères, at an average speed of 12½ miles per

CAPTAIN DRAULETTE'S "AUTOCAB."

hour. The accumulators are arranged in four trays carried under the seats, and weigh not quite 7 cwt.

The electro-motor employed is a special one, of the two-pole type, provided with double carbon brushes. It is suspended at the rear of the vehicle by a spring and roller attachment which permits it a slight movement at starting while still maintaining the connection between the gear wheels. The power is transmitted by a hidden pinion on the motor-shaft to a large toothed wheel surrounding the differential gear on an intermediary shaft, hidden pinions on the ends of the latter gearing with internal toothed rings bolted to the rear wheels. The controller is mounted on a tube which turns around a second fixed tube, in the middle of which is located the steering standard. It is arranged to give four forward speeds (4, 9, 14 and 20 kilometres per hour) and one backward motion (4½ kilometres). In addition, the motor is also arranged to act as an electrical brake, four different

degrees of brake power being provided for, the variations being obtained by means of a single resistance. A new device to be found in the Autocab is that when the cord-brakes on the rear wheel hubs are brought into action by a foot pedal the electrical brake is also automatically applied. The arrangement adopted also permits of the suppression of the usual current breaker, for when the foot-pedal controlling the cord-brakes is pressed down the controller is automatically brought to the zero point, and afterwards drawn over to the braking position. Captain Draulette also claims that his new arrangement prevents any false movements on the part of the driver. With the exception of the first speed and the backward motion all the different speeds, electric brake, etc., are obtained by the controller acting on the windings of the motor, the accumulators being continuously grouped in tension.

The road wheels have wooden spokes, the front pair (the steerers) being 30 in. in diameter, and the rear pair 51 in. Including four passengers and the driver the weight of the vehicle loaded is given as 1 ton 400 lb.

As a result of a series of tests with the vehicle illustrated herewith, Captain Draulette informs us that he has just designed a new type of Autocab, which, while still retaining the same general power, has a much lighter appearance. We understand that orders are already in hand for over one hundred vehicles of the new type for service in France, and in a letter to us Captain Draulette states that he is anxious to arrange for the introduction of his vehicles into England.

In addition to the motor-omnibus which was tried in Berlin two or three months ago, one or two other attempts are now being made to introduce motor-buses on the streets of the German Capital.

We have received from the Grant Axle and Wheel Co. of Springfield, Ohio, U.S.A., a copy of their new catalogue of the Grant roller bearing for the wheels of vehicles. This bearing is controlled in this country by Messrs. J. W. and T. Connolly, of King's Cross, London, N., samples of the same being shown at the recent Exhibition at the Agricultural Hall. The bearing appears to be largely used in America by builders of both horse-drawn and horseless vehicles.

GEORGE SMITH, in the employ of the Allard Cycle Co. Coventry, was last week fined 5s. and costs for furiously driving a motor-car at Ryton. Several constables timed the defendant as doing 110 yards in eleven seconds. The defence was that the defendant was experimenting with the car; and his solicitor said that if the firm were not allowed to test motor-cars on the quiet Coventry roads it would tend against trade.

The Oakman Motor-Vehicle Co., Greenfield, Mass., is undergoing reorganization at Philadelphia. The Oakman Motor-Vehicle Co., of America, has been incorporated at Dover, Delaware, with a capital of £1,000,000. The Company will acquire all patents pertaining to what is known as the Hertel motor, together with all the rights, property and goodwill of the Oakman Motor-Vehicle Company of Greenfield, Mass., the present owners of the patents, with a view of granting to subordinate companies the right to manufacture and sell motor-vehicles covered by the patents in the several States of the United States.

A SERIES of motor-car accidents has lately taken place in France, but all have caused injuries not to the public but to the "chauffeurs," so that nobody has the right of proclaiming motor-cars are dangerous to the general public. Moreover, our Paris correspondent states that the accidents have always been due either to the ignorance or to the excitement of the driver. Motor-cars are given and delivered to anybody, so that the apprenticeship is often so insignificant as to result in accident. A serious examination to obtain the right of handling a motor-vehicle would, it is considered by many, be a good thing both for the "chauffeurs" and for the motor industry.

## "MOSSBERG" ROLLER BEARINGS.

**A**LTHOUGH the merits of roller bearings as applied to rolling mills, railway and electric tram car boxes, etc., have long been recognized, it is unfortunately a fact that the tendency of some manufacturers to make a cheap bearing universally applicable has not been found to be the wisest policy. Of course, the saving power necessarily varies according to the pressure and speed, but in well-designed bearings it should amount to 75 to 80 per cent. of the journal friction. To secure such a result, however, only the best material must be employed, and its manufacture conducted with the greatest care.

That this fact has been recognised is the reason of the success which has attended the efforts of the Mossberg Roller Bearings, Ltd., of 6 Victoria Street, London, S.W. Seeing that the bearing in the form shown in our illustrations is the result of nearly ten years' experience, it can safely be said to have passed beyond the experimental stage. As will be seen from Fig. 1, it consists of a bronze cage in which are

FIG. 1.

a series of hardened and ground steel rollers. The cage, through which the shaft runs, is allowed to run in a cylindrical case fixed in the plummer block. The bearings are made in all sizes from one inch in diameter, being particularly adapted to motor-vehicles, gun carriages, gas engines, machinists' tools, tram cars, etc. We are informed that the Mossberg bearings have been applied to nearly a thousand rolling mills, having, in many cases, run without any perceptible wear for nearly a decade, and permitting a pressure of 20,000 lb. per square inch on the projected area of the journal.

One of the most conclusive tests of the efficiency of the Mossberg bearings over those ordinarily employed was made with a Bemis truck which was equipped by the General Electric Company. This had a load of 3,360 lb., and a power of 240 lb. was required to start the motor by pulling at tangent to radius ( $16\frac{1}{2}$  in.) of wheels of truck when ordinary bearings were used; but in the case where that shown in Fig. 1 was employed the power required was only 18.5 lb. In the case of a Mossberg bearing which had run 150,000 miles on a tram car, the only wear that was perceptible was in the slots of the bronze cage, thus demonstrating how effectually the rollers are prevented from wrapping round the axle. Another test to which the Mossberg bearing has been subjected was with a steel wheel weighing 130 lb. and 14 inches in diameter, being speeded up to 10,000 revolutions per minute. This continued

FIG. 2.

revolving one hour and thirty-three minutes after the source of power had been disconnected without any hurt to the bearing.

Fig. 2 illustrates the end thrust bearings specially designed as a substitute for thrust blocks in shafting subjected to end pressure. They are therefore particularly applicable to motor-car axles, propeller turbine and worm gear shafts, etc. The same principle has been adopted as in the construction of the roller bearings, but they are conical in shape, and tests have proved that an effort of only 5 per cent. as compared with ordinary thrust bearings is sufficient at starting.

In conclusion we would point out that roller bearings require very little lubrication, and that the Mossberg Bearings, Ltd., guarantee a saving of from 10 to 33 per cent. of the power previously used by the adoption of their specialities.

## NEW TYPES OF COLUMBIA ELECTRICAL VEHICLES.

**T**HE most recent types of electric vehicles built by the Columbia Automobile Co., of Hartford, Conn., U.S.A., comprise two pleasure vehicles of the lighter class, a brougham, and an emergency wagon of the type used by electric tramway companies in America.

In the new lady's small Victoria the body is suspended through fore and aft elliptical springs at the rear, and a transverse spring and spring irons at the front, upon a running frame of steel tubing. This carriage is driven through a tubular rear axle, split at the balance gear, but reinforced by a rod passing through its entire length, giving it stiffness, yet permitting the balancing of the two sides of the driving axle when necessary. The balance gear and motor pinion are enclosed in an aluminium casing, permitting of running them in oil. The motor, hung between the rear axle and a cross tube, is intended for twenty amperes and seventy-five volts, at which load it is claimed to yield 80 per cent. efficiency. Its weight is 140 lb. The total weight of the vehicle is 1,450 lb.; of the batteries 690 lb. The usual electrical equipment is supplied, the forty-four cells being grouped in four boxes and giving, through alterations in the grouping, speeds of 15, 7.5 and 3.8 miles per hour. Three-inch pneumatic tires on 28-in. wheels are employed. A runabout phaeton for two passengers is another new type, the electrical and mechanical equipment of which resembles the Victoria very closely.

The new brougham is intended for private use. The small details of this vehicle have been carried out with all the completeness and elegance possible. The body is given an easy riding motion upon half-platform springs at the rear and a compound Brewster spring at the front. The batteries are placed under the driver's seat and at the rear. The interior is luxuriously upholstered in satin, broadcloth and leather, and contains such conveniences as an electric reading lamp, hand mirror, pockets and shelves for parcels, and a small clock set in the upholstery. An electric signal, operated by a push button within, affords communication with the driver at any time. A forty-ampere motor is used on the vehicle, capable of giving 83 per cent. efficiency at normal load and 78 per cent. efficiency at 150 overload. It is spring-suspended, and drives through the balance gear and a single reduction. The wheels are of wood with solid rubber tires. The batteries weigh 1,375 lb., the carriage complete 4,100 lb. The maximum speed is eleven miles per hour, and under good conditions of road twenty-five miles on a single charge can be covered.

The new emergency wagon is equipped with all the appliances and tools carried on wagons of this type—fire extinguishers, extension ladder, stretcher, lanterns, and a complete kit of linemen's tools and apparatus. It is built to carry a crew of four or five men at a speed of ten miles per hour for eighteen miles, this distance being much in excess of the requirements in this class of work. The batteries, weighing 1,400 lb., are carried beneath the main body, and are removable at the side. The total weight is 4,500 lb. Wooden wheels, 42 in. in diameter at the rear and 36 in. at the front, with solid tires, are used.

## MOTOR-CARS ON THE CONTINENT.

## Electrical Motor-Vehicles In Hungary.

At the annual meeting of the Vereinigte Electricitäts Gesellschaft just held in Budapest it was announced that the Company was devoting attention to automobile vehicles, and that it had secured the

rights in a type of electrical vehicle of which great things are expected.

## Paris-Ostend Race.

THE itinerary of this race, which is set down for decision on August 31st and September 1st, has now been definitely fixed. Special care has been exercised to avoid, as far as possible, the terrible "pavés" so common on the

North of France roads. The total distance is 332 kilometres, and those competitors who figure in the tourist class make this journey in two stages, the first being from Paris to Saint Pol (189 kilometres). The tourists will start on August 31st, the racers on September 1st, so that the competitors in both classes will arrive at Ostend during the afternoon of the latter day. A new class has been created in the tourist category, and comprises all vehicles weighing less than 400 kilos., irrespective of their seating accommodation or the horse power of their motors. Among the racing cars already entered are those belonging to MM. Lemaitre, Girardot, Charron, Jecatrays, Degrais and Flash, while MM. Teste, Bardin, Tart, Rivière, Williams, Rigal, R. Kuhling, Degrais, De Modéc, Gasté, Legras, Bistouriste and Merville figure among the motor-cyclists. In the touring class the entrants for voitures are MM. Delizy, Manchon, Mathieu, and Jongla, and for motor-cycles MM. A. Riguelle, Caldas, and Boureau. The start will be effected from Saint Germain.

## Electric Cabs in Berlin.

THE first of the electric cabs which it is proposed to place upon the Berlin streets has now passed its formal police inspection. It is owned by the Thien Berliner Fuhrwesen, and is the invention of Mr. Heilmann, chief

engineer to the Berliner Maschinen-Fabrik. The storage capacity of the accumulators represents a run of forty to fifty kilometres, but it must be borne in mind that the work in Berlin is very light, as practically all the streets are asphalted, and there are no grades worth mentioning. The maximum speed of this cab is fifteen kilometres an hour. It is expected that the service will commence in September, during which month the International Exhibition of Automobiles will be held in Berlin.

## Automobile Club of Germany.

AT a recent meeting of German sportsmen held at the Hotel Bristol in Berlin, under the presidency of the Prince of Hohenlohe, it was decided to found an Automobile Club for the purpose of developing the sport in

Germany. Already 100 members have been enrolled, and under the patronage of the many noble names figuring among the list of officers the success of this new venture is assured. It is proposed to secure a suitable club house at an early date, and also to establish a school of automobilism. The annual subscription has been fixed at 100 marks, and an entry fee of 100 marks will be enforced for members joining after January 1st, 1900. Ladies will be admitted. The following elections have been made:—President: The Duke of Ratibor. Vice-Presidents: Prince Philippe Ernest of Hohenlohe and Count Schoenborn. Committee: Prince of Hohenlohe, Prince of Furstenberg, Count Ratibor, Prince Philippe Ernest of Hohenlohe, Count Talleyrand Sierstorpff, Count Schoenborn, Messrs. Kuhlmann, Goldberger, Pringsheim, Simon, Friedlander, Löwe, Klose, Lobe, and Lewin.

## The Accumulator Tests at the French Automobile Club.

DURING the last two months a variety of types of accumulators have been under test at the French Automobile Club, and on the 4th instant the first official figures were issued. These figures, which we append, will be attentively studied by all interested in electric traction, and it is to be hoped that full particulars of the tests will be published by the Club in due course:—

|               |   | Discharge—Per Cent. |       |
|---------------|---|---------------------|-------|
| Accumulators. |   | June.               | July. |
| 23 B.         | F. Hermel (Austria) .. .. .                   | 35.5                | 9.8   |
| 4 C.          | Société Belge Tudor .. .. .                   | 56                  | 30.2  |
| 9 E.          | Wuste & Rupprich (Austria) .. .. .            | 36.6                | 22.2  |
| 1 F.          | Société du Travail Electricité-Métaux .. .. . | 73.4                | 72.5  |
| 12 H.         | Phénix .. .. .                                | 61.9                | 69.9  |
| 13 I.         | Phénix .. .. .                                | 58.2                | 26.5  |
| 18 J.         | F. Heimeel .. .. .                            | 44.2                | 47.6  |
| 3 K.          | Société Française Tudor .. .. .               | 65                  | 65.8  |

| 19 M.         | Pope & Son (London) .. .. .                   | 70.1                | 42    |
| 11 N.         | Fulmen .. .. .                                | 75                  | 68.3  |
| 10 O.         | Compagnie Blot .. .. .                        | 73                  | 74.1  |
| 17 P.         | Société Souchère Électrolitiques .. .. .      | 57.5                | 42.8  |
| 8 Q.          | Lagerde .. .. .                               | 67.5                | 38.1  |
| 7 T.          | Société Italienne Cruto .. .. .               | 56.3                | 71    |
| 22 S.         | Pope & Son .. .. .                            | 62.5                | 59.7  |

Several of the accumulators originally competing have been either disqualified or withdrawn by their owners.

## The Hour Motor-Tricycle Record.

M. RENAUX's wonderful record of 61 kilometres 797 metres, particulars of which we published in our issue of July 28th, has been speedily eclipsed. On Saturday evening last at the same track, viz., the Parc des Princes, the well-known "chauffeur," Osmont, actually succeeded in covering a distance of 62 kilometres 841 metres, so beating Renaux's figures by 1 kilometre 44 metres. A strong wind commenced to blow after Osmont had reeled off 20 kilometres, otherwise the new record would probably have been about 64 kilometres. We understand that Osmont rode a Phébus tricycle fitted with Aster motor. We append the new times together with those of Renaux for the purpose of comparison:

| Kilo. |       | Osmont.              | Renaux.           |
|-------|-------|----------------------|-------------------|
| 1     | .. .. | 1 m. 58 s. .. ..     | 1 m. 10 s. .. ..  |
| 5     | .. .. | 4 m. 47 s. .. ..     | 4 m. 57 s. .. ..  |
| 10    | .. .. | 9 m. 24 s. .. ..     | 9 m. 35 s. .. ..  |
| 20    | .. .. | 18 m. 47 s. .. ..    | 19 m. 7 s. .. ..  |

| 60    | .. .. | 57 m. 12 s. .. ..    | 58 m. 14 s. .. .. |
| Hour  | .. .. | 62 kilo. 84 m. .. .. | 61 kilo. 797 m.   |

## Paris-Lille Race.

THE organizers of this important event, which is to be run off on the 20th inst., have now decided to eliminate the carriage category, and the race will therefore be entirely reserved for motor-cycles of a maximum weight of 200 kilos. The prizes remain the same—that is to say, five money awards of an aggregate value of 1,050 francs. The start will be made from Chatou on the Saint Germain road at 10.15 in the morning, and the finish will be at the Lille Vélodrome, on the track of which the racers will be required to cover two kilometres. The distance to be traversed is 258 kilometres 500 metres. Among the premier entries we notice the names of Rigal, Tart, and Williams.

## Another Accident.

ON Saturday, at La Fourche, an automobile belonging to the Princesse de Lucinge came to grief in consequence of the collapse of one of the wheels. It is believed that one of the occupants of the car has been somewhat seriously hurt, but full details are not yet to hand. The Princesse de Lucinge is the mother of Prince Aymon de Lucinge-Faucigny, a well-known member of the French Automobile Club.

**A Motor Competition.**

WE stated last week that our French contemporary, *La Locomotion Automobile*, was endeavouring to assist owners of motor-cars in the matter of ascertaining the horse-power of their engines by organizing what it terms "Le Concours de Moteurs." Since then, at the works of MM. Maticet and Blin at Aubervilliers, the initiative commission has held its first meeting and has appointed the officials and committees necessary to carry out the competition. The commission itself is under the presidency of Baron de Zuylen, and consists of thirty-six members comprising many of the best known names in the French automobile world. The officials elected are as follows:—Bureau: Presidents, M. M. Hospitalier and De la Valette; vice-president, M. Carlo Bourlet; secretary, M. Georgia Knap. "A" Commission: MM. Deschamps, Joubert, L. Périssé, G. Sencier, and A. Witz. "B" Commission: MM. Amiot, Augé, Chauveau, G. Desjacques, Joubert, and Gaston Sencier. The A commission will occupy itself more particularly with the brake tests of the motors alone, while the work of the B commission will be the testing of the motors now on vehicles, the results of which will be greatly interesting to the owners. The Baron de Zuylen has promised to place at the disposal of the commissions the seven automobiles he actually possesses, as well as a dozen other vehicles which he has on order.

**A New French Electrical Vehicle.**

It is reported that a new type of electrical vehicle is in course of construction at the machine tool works of Messrs. Huré, in the Rue Lafayette, Paris.

**A Motor-Tricycle Race from Paris to Rouen.**

THE Veloce Club, Rouennais, is organizing a motor-tricycle race, Paris-Rouen-Dieppe-Rouen, for the 27th inst. The distance is about 150 miles.

**Motor Racing in Germany.**

A MOTOR-VEHICLE race, organized by the Bavarian Automobile Club, has just been run off between Innsbruck and Munich, a distance of 173 kilometres. There were eleven starters—four cars, two voitures, and five tricycles; the winner being Baron de Dietrich, who did the journey in 5 hrs. 38 mins.

**Les Criterium des Electriques.**

THE result of the fifty-kilometre race for electrical vehicles organized by *Le Sport Universel Illustré* was given in our last issue. Subsequent to the race, which was run off on the 30th ult., an interesting experiment was made, viz., that of running the competing vehicles round the Longchamps track until the batteries were exhausted. Five competitors started: Cuvelier, on a Bouquin-Garcin-Schivre vehicle, ran 76 kilometres at an average speed of 20 kilometres per hour, a total distance of 126 kilometres (78½ miles) being thus covered by this vehicle on one charge of the batteries; Delory, on a Columbia, did a total of 114 kilometres; Beauvalet (Columbia), 98 kilometres; Garcin (B.G.S.), 90 kilometres; and Creanche, 86 kilometres.

**The Berlin-Dresden Motor-Car Race.**

THE motor-car race between Berlin and Dresden which is being organized in connection with the forthcoming automobile exhibition in Berlin is to be run off on September 18th. The start will take place at 7.30 a.m., and the route will be *via* Potsdam, Elsterwerda, and Meissen.

**The Recent Concours des Fiacles.**

AT a meeting just held in Paris of the Société des Ingenieurs-Civils, M. Forestier presented a paper on the results obtained in the recent *pois-lourds* and *fiacles* competitions recently held in the French capital, under the auspices of the Automobile Club de France. In the course of the paper M. Forestier gave some interesting information regarding the results obtained in the recent motor-cab trials, which we summarise in the appended table:—

| Name.                        | Type.    | Weight.  | Average Speed. |                | Consumption per Kilometre. | Total cost per day. |
|------------------------------|----------|----------|----------------|----------------|----------------------------|---------------------|
|                              |          |          | General.       | On the level.  |                            |                     |
|                              |          | ton. lb. | kil. per hour. | kil. per hour. | Watt-hours.                | fr. c.              |

AUTOMOBILES (LAWSON'S), LTD., was registered on August 1st. Capital £100, in £1 shares. Objects: To carry on the business of motor and other vehicle manufacturers, engineers, etc.

MESSRS. SAUNDERS & SONS, Cycle and Motor-Car Works, Colchester, inform us that they have always a good supply of motor-car spirit in stock, and all accessories for motor-cars. They are also prepared to undertake repairs of all kinds.

MR. E. SHRAPNELL SMITH, the Hon. Secretary of the Liverpool Self-Propelled Traffic Association, informs us that the judges have decided not to publish any figures relating to the recent heavy motor-car trials at Liverpool further than those already issued until the publication of the report about November next.

AT a recent meeting of the Yarmouth Town Council the Watch Committee declined to grant a licence to Mr. Frank Morris for a second motor-car. Mr. C. T. Hunt was granted a licence for a motor-car to ply for hire, and a Mr. Russell, who applied for licences for two motor-cars, was directed to again apply when he had taken up his residence in Yarmouth.

SHORTLY after ten o'clock on Tuesday morning Mr. and Mrs. W. H. Patterson, of 14 Milton Road, W., were riding a tandem tricycle along the Uxbridge Road, when a motor-tricycle ridden by Mr. Mamel Larcom, of Phoenix Street, S.W., came suddenly round a van, on its wrong side of the road, and crashed into the Patterson's machine, with the result that both machines were thrown over, and the three riders precipitated forward on to the road. Mr. Larcom received such severe injuries that it was necessary for him to be put in a cab and sent home, but Mr. and Mrs. Patterson escaped with a few superficial cuts and bruises. Their machine, however, was completely wrecked.

THE subject of motor-cars came in for a large amount of discussion at the meeting of the Bishop Auckland Urban Council, the matter arising upon the application of a motor-car driver for a hackney carriage licence. Mr. Raine thought if motor-cars were to have licences they should be compelled to stand in the same manner as the 'buses and take up their passengers there, and not travel all about the streets picking up fares. Mr. Kilburn said he was inclined to view with favour any modern improvement for the convenience of the general public. In reply to Mr. Guthrie, the Clerk said motor-cars were hackney carriages in the eyes of the law. Eventually it was decided to grant the licence.

# The Berlin Electrical Omnibus.

IN our issue of May 26th last, under the heading "Continental Notes," reference was made to a new electrical omnibus which has recently been subjected to trial in Berlin. We are now able to give an illustration of the vehicle together with a few brief additional particulars. It is the production of a Berlin company bearing the title Die Gesellschaft für Verkehrsunternehmungen, of which Herr Max Meyer is the director. The omnibus, which has somewhat the appearance of a tramcar, has seating accommodation for twelve passengers, while there is room for six more on the rear platform, the front platform being reserved entirely for the driver. The body of the 'bus is entirely distinct from the frame of the vehicle, being suspended thereon by strong springs. The vehicle is propelled by means of two Siemens & Halske electro-motors—one to each of the rear road wheels—the connection being made by spur gearing. The accumulators are of the Pollak type; they number 44 and are arranged in two batteries of 22 under the seats of the vehicle. The weight or capacity of the accumulators is not stated, but they are claimed to be sufficient to enable a journey of from 15 to 20 kilometres to be made on one charge. Movable contact bars are provided on the roof, which enable the accumulators to be charged from the overhead conductors connected with the electric tramways. Steering is effected through the front wheels by means of a hand-wheel very similar to the steering helm of a steamer. The controller-switch is, as usual, arranged to take a number of positions, so that the vehicle can be started slowly and the speed varied as desired, while one position gives an electrical brake by means of which it is stated the vehicle could if necessary be pulled up in a space of  $1\frac{1}{2}$  metres even when going at full speed. Shoe brakes on the rear wheel tires are also provided. The road wheels are of strong construction and are fitted with ball bearings, the front pair being mounted on the usual vertical

pivots. The omnibus, which weighs, without passengers, about  $3\frac{1}{2}$  tons, was recently driven from the Reichstag in Berlin to Charlottenburg, the distance, which is just over two miles, being covered in 25 minutes. The Verkehrsunternehmungen Co. is also taking up the construction of light electrical vehicles, to which we hope to refer in a subsequent issue. We are indebted to the *Electrotechnische Zeitschrift* for the illustration.

AT Dunblane Sheriff Court last week, George Jack, motor-car driver, Edinburgh, pleaded guilty to driving a motor-car on the road near Lochearnhead Hotel at 11.30 p.m. on the 15th ult. without exhibiting lights, and was fined 30s., with 20s. costs.

LA NATIONALE SOCIÉTÉ POUR LE CONSTRUCTION DE MOTEURS, VOITURES ET VOITURETTES AUTOMOBILES is the title of a new company which has just been formed in Paris (34 Rue Kleber) with a capital of £8,000 to acquire and exploit the patents of Messrs. Bouvier & Barbarou.

WE learn that Messrs. Simpson & Bodman, motor-car engineers, have taken over the Pomona Engine Works, Manchester, previously occupied by Messrs. Hume & Lund, where they have put down a full equipment of machinery and plant specially adapted for the construction of motor-vehicles.

A NOTABLE feature at the conclusion of the Paris-St. Malo race was the presence of the military. The streets of St. Malo were lined by soldiers of the 47th Regiment, and in every town the competitors passed through military trumpeters, and drummers warned wayfarers of their approach. For fully five miles at the end of the route military bands joined in the excitement, and altogether the scene presented an aspect of official recognition such as would have alarmed the Duke of Cambridge had he been there to see.

## THE ROSSEL PETROLEUM-SPIRIT MOTOR-CARRIAGE.

THE type of motor-carriage built by M. Edouard Rossel, of 82 Rue des Sarrazins, Lille, France, is now known in France as the "Rochet," the French rights in the carriage having been acquired by the Compagnie Générale des Cycles, of 23 Avenue des Champs-Élysées,

Figs. 3 and 4 show sectional views of the new vertical two-cylinder motor, which is capable of developing 6 h.p., and is located in the rear portion of the vehicle, *A* (Fig. 1). The cylinders *C C'* (Fig. 3) are arranged side by side, and consist of a single casting, the upper ends being connected with the valve chambers by the semi-spherical parts *c c'*. The motor, which works on the Otto cycle, is so arranged that the crank shaft receives an impulse at each revolution, the cranks being set at an angle of 180 degrees to each other, they being

FIG. 1.—THE ROSSEL PETROLEUM-SPIRIT MOTOR-CARRIAGE. SECTIONAL ELEVATION.

Paris. M. Rossel, who, in his early carriages, employed a Daimler motor to propel his vehicles, has since discarded this in favour of a motor of his own design, a description of which will be found below. Fig. 1

fixed on one of their sides to a central disc *T*. The face of the disc has formed on it a cam groove extending twice round it. The admission valves are automatic in their action; the exhaust valves *S* are operated by the rods *t t'* and bell-crank

FIG. 2.—THE ROCHET MOTOR-CARRIAGE WITH 6-H.P. ROSSEL PETROLEUM-SPIRIT MOTOR.

gives a section of one of the latest Rossel carriages—a 4-seated *vis-à-vis*—and Fig. 2 a general view of a Rochet carriage with 6-h.p. Rossel motor.

levers *L L'*, the latter terminating in rollers, which run on the cam grooves *l l'* in the disc *T* above mentioned. The rod of the exhaust valve is not directly connected to the rod *t*, but

terminates in an oscillating arm *s*, which rises or falls with the rod *t*. The crank shaft is provided with a centrifugal governor *R*, which is so connected with the rod *t* as to cause it to miss the oscillating arm *s* when the speed of the motor becomes excessive. The ignition is effected by an incandescent tube *p* and an external lamp *P*. The upper portion of the cylinder is water-jacketed, while the cranks and crank-shaft run in a dust-proof oil-containing casing *B*.

The body, motor, and transmission mechanism are mounted on a frame built up of steel tubes, these tubes being used for circulating the water employed for the cooling of the motor-cylinders. Four forward speeds, ranging from five up

FIGS. 3 AND 4.—THE ROSSET PETROLEUM-SPIRIT MOTOR.  
SECTIONAL ELEVATIONS.

to thirty kilometres per hour, and one backward motion, are provided. The motor-shaft is arranged lengthwise with the vehicle; in line with it, and connected with it through the friction clutch *E*, is an additional shaft which carries at its end, in the oil-containing gear-box *B* (Fig. 1), a spur-wheel *F* (Fig. 5). At the side of this wheel, running loosely on the motor-shaft, is a disc *P*, which on one face has projecting from it five short spindles, on which are mounted spur-wheels *G*, *H*, *M*, *N* and *O*. The first four of these, while being each of a different diameter to give the necessary variation in speed, are continually in gear with the wheel *F* on the end of

the motor-shaft. The four wheels *G*, *H*, *M*, *N*, each have rigidly connected to one of their sides small spur-wheels *I*, *J*, *K*, *L*. Under the action of a lever, the disc can be rolled round the wheel *F* until any one of these small spur-wheels can be brought into gear with the spur-wheel *Q* on an intermediary shaft parallel with the motor-shaft. In this way any one of the four speeds can be quickly put in gear; for the backward motion, the spur-wheel *O*, driven through the train of wheels *F* *G* *K*, is brought into gear with *Q*. From the intermediary the power is transmitted through the bevel wheel *R* to a similar bevel wheel *S* on the differential *C* (Figs. 1 and 5), and from the latter to the rear road-wheels through chain gear. All the levers, including

FIG. 5.—DIAGRAMMATIC VIEW OF THE ROSSET VARIABLE SPEED GEAR.

the one controlling brake shoes on the rear road-wheels, are arranged on the steering pillar. A band-brake *C*, worked by a foot pedal *Z* (Fig. 1), is also provided on the differential shaft. The wheels are of the cycle type, with solid rubber or pneumatic tires. The vehicle, as will be seen from the illustration, is built on graceful lines, and, with the motor provided, it is claimed to be able to mount gradients of 12 per cent. with ease.

As already mentioned, M. Rosset has disposed of the French rights in his motor and motor-carriage to a Paris company, and is, we understand, desirous of entering into negotiation for the sale of the English rights in the same.

THE New England Electric Vehicle Transportation Co. has made a beginning in its automobile business by putting five carriages in service in Boston, Mass.

THE Rubber Tire Co., 1,217 Market Street, Philadelphia, Pa., is introducing a new semi-pneumatic tire which they claim is well adapted to motor-carriages. It is called the Lattina Cellular Tire, and is composed of small interior air cells separated by strong walls of rubber, so that a puncture cannot, it is claimed, injure more than one or two of them.

MR. F. O. STANLEY, Newton, Mass., has issued a challenge for a motor-race to cover a distance of ten miles. Mr. Stanley will use the steam pacing machine, which it is stated recently covered a mile in 1 m. 47 s. The challenge has been accepted by the Waltham Mfg. Co., Waltham, Mass., agents for the De Dion motors in the United States.

THE Cleveland Machine Screw Co., of Cleveland, U.S.A., is preparing to enter into the extensive manufacture of electric motor-vehicles. The work is under the direction of Mr. E. E. Sperry, of Cleveland, who has become electrical engineer for the Company, and who is well known for his inventions in connection with electric tramways enterprises.

## A TWENTY-FOUR HOURS' MOTOR-TRICYCLE RIDE.

**M**R. J. W. STOCKS sends us the following account of a recent interesting ride he undertook, mounted on his motor-tricycle:—"On Wednesday evening, the 2nd inst., I started from Yardley at the fourth milestone from Birmingham at 6.15 p.m., with the idea of proving what really could be done in twenty-four hours on one of our standard pattern Ariel motor-tricycles. The course I chose was from Yardley to Barnet (94 miles), Barnet to Doncaster (150 miles), returning the same way—488 miles in all. I timed myself to reach Barnet at 10.55 p.m., or four hours and forty minutes to cover the 94 miles. I was not far out in my calculation, as I arrived at Barnet at 11 p.m., or five minutes late. Between Barnet and Hitchin I unfortunately took the wrong way in the dark at Welwyn, and, finding myself on a strange road, had to alight at each turn to interrogate the signposts. Instead of arriving at Hitchin at midnight, it was about 1 a.m. (losing my way and going about two miles farther round lost me an hour). I made a hurried meal, recharged with petrol and lubricating oil, and set out again for Doncaster, which I reached at 7.40 a.m., instead of 5.55 according to my time-table. The delay was occasioned in the first instance by losing my way, and the intense darkness between 11 p.m. and 2.30 a.m.; and a few miles before I reached Retford my inlet valve pin worked out and allowed the valve to fall on top of the exhaust. It was some time (about twenty-five minutes) before I could get this right, as the seating was too hot to remove, and I had to wait until it cooled somewhat to fit a new one. I covered 221 miles in the first twelve hours. From 3.30 a.m. (when I could see the milestones) I covered 152 miles in 7 h. 25 m., including the repair to inlet valve, and short stop to feed myself and recharge the motor. I reached Barnet at 3 p.m., having covered 396 miles in 20½ h. I then turned my machine towards home, and had covered another 25 miles when I had another twenty minutes 'conversation' with my inlet valve, probably through my previous repair being not as successful as it might have been under less hurried circumstances; and upon reaching Stony Stratford (38 miles from Barnet) at 5.15 p.m., had to again interview the inlet valve, and found that the continuous lifting of same had caused a fracture in the metal, and broken off a piece of the stem. Since my ride I find that I took an old pattern inlet valve with me, and the chances of breaking in this direction have now been obviated by making them differently. As I had not another spare valve with me, I was compelled to finish at twenty-three hours, having ridden 434 miles in that time. My tricycle was fitted with standard gear, which is capable of taking the tricycle along at the rate of 24 miles an hour, ordinary hills making very little difference in speed. My average speed was 19 miles an hour, so that, including stoppages, easing for horses through villages, etc., I drove the tricycle at full speed for twenty-three hours continuously. My engine worked as well during the heat of the day and right up to the end of the twenty-third hour as it did during the first cool hours of the evening. I only used one motor-tricycle the whole way, was unaccompanied, and only made arrangements for food and petrol at Hitchin and Doncaster."

An automobile club has just been formed at Salon, France.

A CORRESPONDENT of a Bedford paper, who styles himself "Rusticus," does not look upon the motor-vehicles in Bedford with approval simply because he is the owner of a pony which is, on this point at least, of the same mind as himself. As a consequence, he feels he should say something against motor-cars, and relieves his mind by referring to them as "horrible inventions," "abominations," "steam bogeys," etc.

## CORRESPONDENCE.

### SOME OUTSIDE SUGGESTIONS AND REMARKS.

TO THE EDITOR OF *The Motor-Car Journal*.

SIR,—When will some one make a start in establishing accumulator-charging stations at points on our main roads, so that electric cars with an interchangeable set of batteries may become general? Accommodation should also be provided at the charging station for housing cars. This appears to me to be what is required for the million. The charging station should be able to supply power for many other purposes, and thus ensure a financial success.

I was trying to explain to mine host at a country-side inn the other day the progress of the motor-car industry and the wonderful increase in the number of vehicles, when I got for reply, "Oh, those things will only be a nine days' fad: horse-flesh will never be superseded—it cannot be dispensed with." It is very hard to convince people who have an interest in any matter or calling that it may be superseded, and such replies as this are an everyday experience.

Over 500 horse-drawn vehicles passed my house near Epping Forest on Bank Holiday; quite 200 of these were brakes full of pleasure seekers. Here is a gold-mine in the future for steam brakes.

I notice in the daily papers some foreigner has stated that England is selling only the old and useless patterns of motor-cars from France and Germany. If I am any judge of my countrymen, in the future, when France, Germany, and Belgium want a reliable car they will send to England when our engineers have taken the matter up. It is probable that in the future the motor-car industry will absorb as much capital as the railways have done.

Leytonstone,

August 9th, 1899.

Yours faithfully,

OBSERVER.

### AN UNNECESSARY INDIGNITY.

TO THE EDITOR OF *The Motor-Car Journal*.

SIR,—You will say I am only taking advantage of our national liability to grumble in writing you on the above subject, but I cannot repress myself. It is bad enough that automobilists should be at the mercy of every policeman who cares to raise his little finger; but their position when appearing at the police-court is even worse. I was a witness in a recent case in a London police-court and got there early in the morning, having to wait in the corridor with a miscellaneous collection of dirty bodies clothed in ragged raiment and in an atmosphere that was full of vile odours. Hardly a face around did not bear evidence of recent conflict, and black eyes were as plentiful as blackberries in their season.

Inside the court was not much better; and does it not seem intolerable that gentlemen of position should have to assemble with the usual characters who frequent police courts? Cannot our magistrates recognise the difference between a "drunk and disorderly" and an attack of automobiliousness on the part of a constable which leads him to summon people to such offensive places?

I enclose my card and remain, Yours truly,

Westminster, S.W.

A GENTLEMAN.

[We quite agree with our correspondent as to the unpleasantness of the position, having recently been in attendance at the West London Police-Court in a similar capacity—that of witness.—EDITOR M.C.J.]

### ON THE ROAD.

TO THE EDITOR OF *The Motor-Car Journal*.

SIR,—There is a growing disposition, I believe, in the ranks of automobilists to take up a less unfriendly attitude than of yore to racing, and I do not think we shall ever have the cars universal until trials of pace have been made to enable manufacturers to gain the experience which is impossible under the present circumstances. At the same time I would abhor the man who indulged in reckless speeds

regardless of men or sheep in his path; and your interview with Mr. Arthur Goodwin seems to suggest the very thing required to popularise the motor-car, and also to demonstrate to the British public that it is capable of reliable and satisfactory travel.

His ride of 4,700 miles on business shows that we have got beyond the days of experiment, and if half a dozen other commercial travellers could be prevailed upon to conduct their journeys by similar means a great impetus would be given to the industry. For a motor vehicle—whether tricycle or car—to behave as well as the machine he rode shows that there should be no difficulty in the matter, and after a season or two the commercial travellers in many trades would leave the rail and take to the road.

Cycle manufacturers and motor-car makers, too, can render good service by encouraging the use of motor-tricycles by their representatives when on their business journeys, and if they are wise they will take the hint, and then rides of 4,700 miles will become commonplace performances—thanks to the new industry that is being developed in this country.

Manchester,

Yours truly,

August 9th, 1899.

A. F. PICKUP.

We might mention that the patent "Buffoline" noiseless gear wheels were used by the Leyland wagon at the Liverpool trials, considerably reducing the vibration and noise.

MR. J. H. PATERSON, manager of the Caledonian Motor-Car and Cycle Company, Aberdeen, has sold, on behalf of the Company, their Daimler-Rougemont motor-wagonette. The purchaser is Dr. G. R. Wilson, Edinburgh.

A TELEGRAM from Havre reports that a serious collision took place between a market gardener's cart and a motor-car belonging to M. Desfosses, who is staying at Etretat. The latter was completely overturned by the collision, and four gentlemen who were riding upon it were severely injured.

THE committee of the French Automobile Club are reported to be busily engaged in arranging for another great motor-car race to be held next summer. It is probable that this race will be from Paris to St. Petersburg, although this is not yet positively settled. A couple of experts have been sent on motor-cars to study the roads and make a report on the conditions which would have to be met. Some enthusiasts have suggested a race to Constantinople, while others would like to organize a race to Vienna and back.

A COMPANY under the title of the Newcastle and District Motor-Car Co., Ltd., has been formed with a capital of £10,000 for the purpose of carrying on the business of motor-car proprietors. It is proposed to run cars to Heaton and Byker, Scotswood, Gosforth, Gateshead, Low Fell, and also on holidays and other occasions to Ponteland, Stannington and Morpeth, and between Tynemouth and Whitley. The following gentlemen form the directorate: Messrs. Jacob Daglish, W. E. Slater, Fred. G. Scott, Thos. W. Rowe, and John Duncan; and Mr. J. A. Williamson, St. Nicholas' Chambers, Newcastle, is acting as secretary.

THE Riker Electrical Vehicle Co., of Brooklyn, N.Y., U.S.A., have sent us particulars of a new electrical "run-about" they have lately put on the market. The vehicle, which has seating accommodation for two persons, has a wheel base of 4 ft. 2 in. Two electro-motors of  $\frac{3}{4}$  kilowatt capacity each are provided, connected to the rear axle by spur gearing. The controller is arranged to give three forward speeds and two backward motions, the maximum speed being about 10 miles per hour. The battery of accumulators is stated to be of a capacity sufficient for a run of 25 miles. The wheels are of the cycle type, shod with pneumatic tires. The weight of the car complete is about 1,300 lb.

## THE METZ VARIABLE SPEED-GEAR FOR MOTOR-CARS AND CYCLES.

—88—

ONE of the latest two-speed gears to come under our notice is that which has lately been introduced by M. R. de Metz of 11 Rue Cogniet, Paris, and of which details are shown in Figs. 1 and 2 herewith. The gear, which is claimed to be not only adaptable to motor-tricycles but also to light motor-cars, is mounted on an extension of the motor-shaft. Referring to the illustrations, *A* is the motor-shaft; to the end of it is screwed a second shaft *B*. Keyed on the centre of the latter in such a way that while rotating with it it is free to be displaced laterally is a double clutch *C*. On each side of the clutch spur wheels *E* and *D* are mounted, the wheel *D* running loosely on the shaft *B*, while *E* is rigidly keyed on a hollow shaft surrounding *B*, and carrying on its end the driving pinion *K*. Each of the spur wheels *D* and *E* is of a special type, having formed on their inner faces what may be termed female portions of the clutch *C*. Parallel to and below the shaft *B* is a second shaft *M*, which carries two pinions *D'* and *Q*,

FIGS 1 AND 2.

both rigidly keyed on the shaft and gearing with the spur wheels *E* and *D* on the shaft *B*. The clutch *C* is controlled by the double-armed levers *R* and *L*.

As regards the working of the gear, if the lever is pulled over so as to bring the clutch *C* in gear with the wheel *E* on the hollow shaft, the pinion *K* is driven at the same speed as the motor. When a low speed is desired, the clutch *C* is pulled over to the right so as to gear with the pinion *D*, the power of the motor being then transmitted through the clutch *C*, and the wheels *D*, *D'* and *Q* to the wheel *E* and pinion *K*, the latter being consequently driven at a lower speed than that at which the motor is running. It will be noticed that, whichever speed is in gear, the pinions *M*, *D*, and *D'* are continually running, although doing no useful work when the clutch *C* is gearing with *E*. The clutch is also so arranged that it can be fixed in a central position, so putting the motor entirely out of gear with the power-transmission mechanism. The whole of the gear works in a dust-proof case *I*, while special provision is made for the lubrication of the various moving parts by means of the lubricator *H* and the channels formed in the shaft *B*. It is claimed that the gear can readily be fitted to existing cars and cycles, and that, by reason of the fact that the whole of the pinions are always in motion, the change from one speed to the other can be made both quickly and noiselessly. We are indebted to *La Locomotion Automobile* for the illustrations.

So far as the motor-'bus is concerned, Dover has shown a better public spirit than seems to animate some of the people of Bournemouth, and the Pioneer motor-'bus now running between Dover and St. Margaret's should demonstrate the commercial possibilities of the new means of locomotion. Mr. J. J. Bettridge is secretary of the local motor-'bus company.

## THE RUMPF PETROLEUM-SPIRIT MOTOR-CARRIAGE.

THE accompanying illustration shows a new type of petroleum-spirit motor-carriage which has been lately introduced by the La Société Le Progrès Industriel of 26 Rue de l'Echiquier, Paris. The car, which has been built to the designs of M. H. Rumpf, is of small proportions, the object of the designer being to produce a vehicle which, while having the power and rigidity of the larger class, is lighter and more stable than the latter. The motor has two balanced cylinders, and gives, it is claimed,  $6\frac{1}{2}$  h.p. on the brake. The ignition is electrical, while the cooling of the cylinders is effected by means of a water-jacket. The engine is located in the fore-part of the frame, the front seat being

readily removable to give access to the working parts. Four forward speeds—8, 16, 28 and 45 kilometres per hour—and one backward motion are provided, all being controlled by a single lever within convenient reach of the driver. The motor and transmission gear occupy relatively a very small compass, and are entirely enclosed by the body of the car. Band brakes acting on the hubs of the rear road wheels and controlled by a hand lever are provided, while a third band brake actuated by a foot pedal is fitted round the differential gear. Wheel steering is adopted, the road wheel having wood spokes and pneumatic tires. The petrol storage tank is said to have a capacity sufficient for a continuous run of fifteen hours.

A COMPANY has just been formed in Paris (33 Rue de Toul) with a capital of £4,000 to be known as La Société des Moteurs et Voitures "Aigle."

MANITOWOC, WIS., U.S.A. will shortly, probably, have an automobile-stage line, the Manitowoc Traction Co. having been organized for the purpose. It is said that the Company has placed an order for four motor passenger coaches. Two will be used for transportation of passengers about the town, one will be run between Manitowoc and Two Rivers, and the fourth will run between English and Silver Lakes and Manitowoc.

## HIGHER POWER FOR MOTOR-CARS.\*

THERE is one feature connected with the automobile which, for the good of the business, should be continually dinned into the ears of the public, viz.: high power. It is so common to associate a single horse or at most a team with the ordinary vehicle that we cannot help connecting the idea of one or two horse power with a motor vehicle. This is not a mistake made only by the uninformed and the thoughtless, but it extends even to our best engineers. It is aggravated further by the fact that the public demands better and faster service of the mechanical vehicle than it can get from the horse vehicle, and this increased demand necessitates a much larger power.

Street railway engineers have been through this experience for ten years or more and are still putting on heavier motors. True they are increasing the sizes of their cars, but on cars of the same size much higher powers are used to meet the demands of the public.

The experience of vehicle users abroad is very clearly in this same direction. Higher power, lighter weight and faster speeds are all being demanded.

The writer, like everybody else, knew the difference between a horse and a mechanical motor, and made in his early motors what seemed to be sufficient allowance therefor. The common result was found and larger motors used, only to be replaced again with still larger, until to-day he is using a 6-h.p. motor in a 700-lb. vehicle, and does not find it too large or too powerful for many of the conditions which confront it on bad roads or in bad weather.

It is quite probable that still higher powers will be found advisable, if the experience of the French be regarded. Where they formerly had 2, 3 and 4 h.p. they are now using 4, 6, 8 and even more, and when it is remembered that their roads are hard and smooth it can easily be seen that our powers must be heavier.

While it is possible to build a vehicle and equip it with low gear so that a light motor will probably run at a low speed, it is not satisfactory nor saleable. The experience of a motor-vehicle user not long ago fits the case nicely. He said: "When I first received my vehicle it would do about eight miles per hour and I was immensely pleased. This speed was better than the horse could average and the motor never tired. The satisfaction, however, was short until more speed was desired. By re-boring the cylinder and changing the gears I manage to coax out sixteen miles per hour under good conditions now, but I wish it was thirty-five." This last wish was expressed with a heartiness which only a man who has enjoyed the pleasure of skimming over a good road, through a beautiful country, can appreciate.

When asked if thirty-five was not stretching the matter a little he replied: "Not at all. When one sees several miles of clean road ahead he enjoys shooting it at the highest speed possible"—and this is undoubtedly true. It is a great satisfaction to have ample speed on a stretch of fine road or in a brush with your neighbour's fast trotter.

It is easy to lose one-half your love for the machine if every horseman who comes along can pass you with a smile of derision. It is also very aggravating to find a bit of mud or a steep hill barring your way and forcing you to turn back. You are constantly haunted by the feeling that the road beyond that hill would have been fine if you had only been able to get to it.

The facts to keep in mind, then, are twofold: first, that the horse can exert several horse power for a short time; and second, that the motor is expected to give much better than horse service. On this account a motor, to do the work of a single horse satisfactorily, should be 3 or 4 h.p., and to do the work of a team 6 or 8 h.p. With such power and proper vehicle construction the motor-vehicle can traverse horse roads, and where they are at all good will give better speed than is possible with horses.

\*By Chas. E. Duryea, in *The Horseless Age*.

## MOTOR-CYCLE RACING.

### THE CRYSTAL PALACE.

In ideal weather a series of very successful motor-cycle races organised by the Motor-Car Club was held at the Crystal Palace on Monday last, when the Bank Holiday crowd was treated to some excellent racing, in which Mr. S. F. Edge figured prominently, retaining his holdership of the Crystal Palace Brassard Cup. Mr. F. F. Wellington was the judge, Mr. G. P. Coleman and Mr. F. W. Bailey the timekeepers, and Mr. Frank Smith the starter, the results being as follows:—

Motor-Cycle Handicap (two miles).—C. Jarrott, scratch (De Dion tricycle), 1; S. F. Edge, scratch (De Dion tricycle), 2; C. G. Wridgway, scratch (Phébus tricycle), 3; J. W. Stocks, 200 yards start, 0; E. Buck, 540, 0; F. Eason, 670, 0. Won by half a length, the same distance dividing second and third. Time, 3 m. 23 s.

Motor-Cycle Race (five miles handicap).—S. F. Edge, scratch, 1; C. G. Wridgway, scratch, 2; C. Jarrott, scratch, 3; J. W. Stocks, 35 s. start, 0; E. Buck, 80 s., 0; F. Eason, 125 s. 0. After going three and a half miles Edge went right away and won easily by 100 yards. Time, 8 m. 28½ s.

Motor-Cycle Race (ten-mile scratch).—S. F. Edge, 1; C. G. Wridgway, 2; J. W. Stocks (Ariel tricycle), 3. C. Jarrott retired at three miles. Edge led for the first two miles, and after Wridgway had made an effort for the lead at four miles Edge again went away and won by nearly half a lap, Stocks being half a lap further off.

| Miles. | Leader.           | Time.        |
|--------|-------------------|--------------|
| 1 ..   | S. F. Edge ..     | 1 m. 47½ s.  |
| 2 ..   | S. F. Edge ..     | 3 m. 25½ s.  |
| 3 ..   | C. G. Wridgway .. | 5 m. 2½ s.   |
| 4 ..   | S. F. Edge ..     | 6 m. 42½ s.  |
| 5 ..   | S. F. Edge ..     | 8 m. 23 s.   |
| 6 ..   | S. F. Edge ..     | 10 m. 8½ s.  |
| 7 ..   | S. F. Edge ..     | 11 m. 58½ s. |
| 8 ..   | S. F. Edge ..     | 13 m. 42 s.  |
| 9 ..   | S. F. Edge ..     | 15 m. 24½ s. |
| 10 ..  | S. F. Edge ..     | 17 m. 11½ s. |
| 10 ..  | C. G. Wridgway .. | 17 m. 33½ s. |
| 10 ..  | J. W. Stocks ..   | 18 m. 24½ s. |

Crystal Palace Brassard Cup (value 100 gs.); duration, one hour.—S. F. Edge (holder), 1; C. Jarrott, 2; J. W. Stocks, 3; C. G. Wridgway, retired. After the first mile was completed it was a match between Edge and Jarrott, Edge eventually winning by a straight, after covering 35 miles 1,026 yards in the hour.

| Miles.        | Leader.     | Time.        |
|---------------|-------------|--------------|
| 1 ..          | Wridgway .. | 1 m. 50½ s.  |
| 5 ..          | Jarrott ..  | 8 m. 34½ s.  |
| 10 ..         | Edge ..     | 17 m. 7½ s.  |
| 15 ..         | Edge ..     | 25 m. 29½ s. |
| 20 ..         | Jarrott ..  | 33 m. 57½ s. |
| 25 ..         | Jarrott ..  | 42 m. 39½ s. |
| 30 ..         | Edge ..     | 50 m. 52 s.  |
| 35 ..         | Edge ..     | 59 m. 0½ s.  |
| 35 1,026 yds. | Edge ..     | 60 m. 0 s.   |

### HARROGATE.

At the North of England Cyclists' Meet at Harrogate on Monday there was a two-miles motor-tricycle handicap, resulting as follows: 1, A. Farnell (Bradford), 1½-h.p. De Dion (½ lap); 2, R. R. Jackson (Bradford), 2-h.p. auto (scratch); 3, R. Blacklock (Sunderland), 1½-h.p. De Dion (1 lap). The other competitors were Rowland Winn (Leeds), 2-h.p. auto (scratch), and F. Turvey (Sunderland), 1½-h.p. De Dion (½ lap). Time, 5 m. 2½ s. Farnell won very easily, and Blacklock lay a considerable distance behind Jackson.

## THE AUTOMOBILE COMPANY BOOM IN AMERICA.

For some months past practically each and every American mail has brought with it the news of the formation of a new motor-car company in the United States, with capitals very often running into seven figures. Some of the big companies, with their authorised capital, recently incorporated in America, are:—

|  |                      |
|--|----------------------|
| The Automobile Company of America .. .. .                        | \$5,000,000          |
| The International Vehicle Company of New York .. .. .            | 5,000,000            |
| The Chicago Electric Vehicle Company .. .. .                     | 2,000,000            |
| The Woods Motor-Vehicle Company of Chicago .. .. .               | 10,000,000           |
| The Wite Motor-Wagon Company .. .. .                             | 10,000,000           |
| The Lewis Motor-Vehicle Company .. .. .                          | 10,000,000           |
| The Columbia Automobile Company .. .. .                          | 3,000,000            |
| The Illinois Electric Vehicle and Transportation Company .. .. . | 25,000,000           |
| The New England Electric Vehicle and Transportation Co. .. .. .  | 25,000,000           |
| The New York Electric Vehicle and Transportation Company .. .. . | 25,000,000           |
| The Pennsylvania Electric Vehicle Company .. .. .                | 6,000,000            |
| The General Carriage Company of New Jersey .. .. .               | 20,000,000           |
| The Canada Lewis Motor-Vehicle Company .. .. .                   | 1,000,000            |
| The National Bicycle and Motor Company .. .. .                   | 2,500,000            |
| The Riker Electric Vehicle Company .. .. .                       | 7,000,000            |
| The Leads Motor-Vehicle Company .. .. .                          | 5,000,000            |
|  | <b>\$161,500,000</b> |

In addition sixteen companies have been incorporated for \$100,000 each by the so-called Electric Vehicle Syndicate, to operate in Tennessee, Georgia, Ohio, Kentucky, New Jersey, Louisiana, Delaware, California, Michigan, Minnesota, Iowa, Maryland, Wisconsin, Indiana, Missouri, and Virginia.

## A BLACKPOOL MOTOR-CAR COMPANY.

An action was brought by John Stephen Barrow, accountant, of Albion Street, Leeds, against W. Reid Ballantyne, of the Roost, Lytham, for the recovery of £75, money alleged to be due. Mr. Waugh was for the plaintiff, and Mr. Manisty for the defendant.

It appeared that in 1897 a company was floated called the Blackpool Motor-Car Company, and defendant's name appeared on the prospectus. Defendant applied for 100 £1 shares, for which he paid £12 10s., the amount due on application. In August, 1897, the directors decided that the Company should go to allotment, and that on allotment a call should be made of 2s. 6d. per share, and subsequently defendant paid another £12 10s., being the amount due on allotment. The Company went into liquidation, and the plaintiff, being appointed liquidator, now sought to recover £75, the amount still owing on the 100 £1 shares.

Defendant denied the allotment of the shares to him, and denied that he accepted them. He stated that he had never received any notice of allotment or of calls.

A verdict was given for the plaintiff for the amount claimed.

## MOTOR-PACING ON THE PUBLIC HIGHWAY.

At the Kingston County Bench last week Mr. D. M. Weigel, of Notting Hill, was summoned for furiously driving a motor-tricycle to the common danger in Ditton Road, Tolworth, on July 9th. Inspector West said the defendant was pacing a cyclist who was riding behind in a cloud of dust at the rate of twenty miles per hour. It was in consequence of numerous complaints about motors that the proceedings were taken. Defendant, who did not appear, was fined £5 and costs.

## AN EXPERIMENTAL MOTOR-CAR.

At the West Riding Assizes at Leeds last week, before Mr. Justice Grantham, Thomas Myers, engineer, of Halifax, brought an action to recover £126, arrears of salary, from Albert Edward Harrison, engineer, also of Halifax. There was a counter-claim for £2,393, made up of expenses incurred by the plaintiff while in defendant's employ for machinery and so forth, all of which was wholly unsuited to defendant's purpose now, and £75 for money lent privately. Mr. E. Tindal Atkinson, Q.C., and Mr. Yarborough Anderson were for the plaintiff, and Mr. Scott Fox, Q.C., and Mr. G. P. Walker were for defendant.

Plaintiff was engaged in March of last year as manager of a motor department started by defendant, and undertook to produce a specimen oil motor-car, free from smell and noise, equal to any other in the market. During the time he was in defendant's employ it was arranged that plaintiff should receive £7 10s. per week, and an additional £2 10s. per week for all the time he was employed by defendant, providing the motor-car was approved. Plaintiff contended that he built a motor-car in accordance with his agreement with the defendant, but the latter denied this, stating that he had never approved of it, and that it was, in fact, a complete failure. Plaintiff's claim was made up of 10s. arrears of salary on the £7 10s. per week, and the additional £2 10s. already alluded to. Plaintiff was summarily discharged by defendant on April 28th, 1899, owing, as the latter said, to his incompetency, and he claimed damages for wrongful dismissal.

Plaintiff, in reply to his Lordship, said the car he made was purely an experimental one. Its power was 2-horse, but it was usual, in the case of a two-passenger light car, to have 3½ h.p. He was to have had £10 per week from defendant, only after the car had been approved, and he received that amount when he left York and went and worked for defendant at Halifax.

The defendant stated in evidence that the plaintiff left no doubt in his mind that he would produce a car that would be acceptable to intending purchasers. The car that plaintiff built was tried by defendant himself and some gentlemen interested in the undertaking, and proved a failure. It would not run up and over an incline of 1 in 35. They had to get out, take it back, and give it a flying start, by means of which it just managed to crawl over the summit of the rise. There was considerable noise about it, and it was by no means free from smell. Early in the present year the workshop was removed from York to Halifax, where the plaintiff commenced to construct another car. Defendant gave him a fortnight, and told him that if the vehicle was not then ready he would be discharged. When the fortnight had elapsed, the parts of the car were still lying about the workshop, and the plaintiff was accordingly dismissed.

The jury, at the conclusion of defendant's evidence, intimated that they were satisfied the plaintiff did not construct a practical two-passenger heavy or light motor-vehicle, as per agreement.

His Lordship concurred.

A verdict was accordingly returned for the defendant on the claim, and also on the counter-claim, the jury awarding him £75, representing loans made to the plaintiff and admitted by him.

## TROUBLE AT LEICESTER.

At the Loughborough Petty Sessions last week Henry Cann, driver, of Rutland Street, Leicester, was summoned for an infringement of the Light Locomotives Act, at Rothley, on July 22nd. Mr. Wilfred Moss appeared for the defendant. The police authorities prosecuted, and Elijah Cox, omnibus proprietor, of Mountsorrell, was the informant. The facts, as detailed in evidence, were that the defendant was the driver of a motor-car running between Leicester and Mountsorrel. On the date named Cox was driving his omnibus in the opposite direction, and made a signal for the driver of the motor-car to stop. The signal was not heeded, hence the summons. The omnibus driver said his horses became restive at the approach of the motor-car. For the defence Cann was sworn, and said there was no necessity to stop. Cox's horses were not restive. Witness pulled up when requested. The practice in driving a motor-car was to stop on seeing a restive horse, but otherwise they only slowed down on being signalled to. By Mr. Moss: Cox had frequently stopped the car wantonly, and his passengers had jeered at the motor as it passed. The car had been running from Leicester since April 19th. George Sampson, motor-car engineer, of Leicester, and Fredk. S. Rudkin also gave evidence for the defendant, Rudkin stating that he had formerly been in Cox's employ, and whilst driving the 'bus had instructions to always hold up the whip to stop the motor-car on meeting it. The Bench decided to convict, and imposed a fine of £2, costs included, or in default fourteen days hard labour.

## MR. A. O. STOPES AND HIS MOTOR-CAR.

At Bedford County Court, before his Honour Judge Bagshawe, Arthur Edward Banks, farmer, of Muggerhanger, sued Arthur Othniel Stopes, of East Hill, Colchester, to recover damages for personal injuries and injuries to his horse and trap by reason of the defendant's alleged negligent driving of a motor-car. The plaintiff stated that on Saturday, March 11th, he was driving home from Bedford in his horse and trap. While going through Fenlake he saw a motor-car coming in the opposite direction. It was travelling at a great speed, and he shouted and held up his hand. The car, however, did not stop, and there was no time for him to get out and hold his horse's head. The horse swerved to the side and collided with a fence. The cart was upset, and witness was thrown out. The body of the cart was smashed up and the axle was bent. The next day he met the defendant on his car, but the horse did not shy, as there was time to get out and hold the horse's head, the car travelling at a reasonable rate. In consequence of the accident it would not be safe to drive the horse again. He sold the horse about a month afterwards for £15. He considered he lost £5 upon that sale. He wrote to defendant asking for £10 to settle the affair, but as he got no reply, he brought the present action.—Thomas Dynas and John Buckle said they saw the motor-car travelling at the rate of sixteen miles an hour.

The defendant said the car was running at twelve miles an hour. He saw the plaintiff at a distance of 200 yards. He began to slacken speed immediately. He saw the plaintiff hold up his hand, and then he stopped within thirty-five yards. The accident happened directly afterwards. On the following day he was driving along the same road, when plaintiff had to drag his horse past the car. He had had two years' experience of motor-cars, and had driven that particular car over 2,000 miles. The car was at rest before he reached plaintiff, who drove up to him, and it was then that the horse shied.—Mr. Horace Wright, of Colchester, said he was riding with the defendant in the car on the day in question. He corroborated the defendant's evidence.—P.C. Gaylor said the trap upset at the spot where the car had stopped.—Judgment was entered for the plaintiff for the full amount, £15.

## A MIDNIGHT SCENE IN THE WEST END.

At Marlborough Street Police-Court last week Mr. Robert Moffat Ford, of 168 Shaftesbury Avenue, W.C., was charged before Mr. Fenwick with threatening to shoot Harry Patten, a cabman, of Ranelagh Road, Paddington. The cabman deposed that about midnight on Thursday he was driving along Shaftesbury Avenue with a fare in his cab when the prisoner, who was driving a motor-car, shot past him and crossed in front of his horse. He then jumped off his motor, caught hold of the horse's head, and said, "I want your number." He (the witness) jumped off his cab and said, "Leave go of the horse." Ford replied, "Leave go of me or I will put a bullet through you," and pulled something out of his pocket which the witness could not see. A policeman eventually arrived, and the accused was arrested.

Mr. Ford, who elected to give his version of the affair on oath, said he was driving his motor-car along Shaftesbury Avenue on the previous night, and there was plenty of room to pass between the cab-rank and any other vehicle. He blew his horn, and passed on the off-side as he should do, but the cab only squeezed him further and further into the cab-rank, and he touched the horse's legs as he passed. This kind of conduct on the part of cabmen having occurred to him regularly about once a month, he was determined to find out those who misbehaved themselves, and summon them. He took hold of the reins and stopped

the horse to get the cabman's number in order to summon him, when he was surrounded by a gang of cabmen and roughs. The cabman refused to give him his number, and he was in consequence kept there with the threatening crowd. It was only after he had been there about twenty minutes, having had a "very warm time" of it, that he became alarmed and pretended he had a pistol. In reality he had nothing of the kind in his possession. When the policeman arrived they all went to Vine Street police-station, he, after the cabman had stated his case, being detained there, spending a rather uncomfortable night in a police-cell. He considered he had a serious claim against either the cabman or the police.

Mr. Fenwick said it was clear there was no revolver, but something must be done to prevent these unseemly quarrels in the street, and the prisoner would be bound over in his own recognisances in the sum of £10 to keep the peace for six months.

## A MOTOR-CAR ACCIDENT.

At the Newcastle Police Court, last week, before Mr. G. Luckley (chairman) and Col. Adamson, Vincent Harvey was charged with negligently driving a motor-car in Blackett Street on July 16th so as to injure Felix Green. For the prosecution it was stated that Green, who was an old man, was walking along the crossing when a car overtook him and knocked him down, injuring his hip. No warning of the approach of the car was given. At the time of the accident the vehicle was going at the rate of six or seven miles per hour.

Colonel Adamson said the Bench were of opinion that although the defendant was not driving at an excessively high rate, yet that having regard to the fact that he was crossing a thoroughfare which was very much frequented by foot passengers, he had not exercised sufficient care. It was not, however, a serious case, and they considered it would be sufficiently met by imposing a fine of half-a-crown and costs. Defendant was also ordered to pay the witnesses' fees.

## TO CORRESPONDENTS.

All communications intended for insertion in this Journal or relating to Editorial matters should be addressed to THE EDITORIAL DEPARTMENT, MOTOR-CAR JOURNAL, 39 and 40 Shoe Lane, London, E.C. Letters must in all cases be accompanied by the name and address of the writer, as no notice will be taken of anonymous communications.

The Editors cannot undertake to return MSS. or drawings, although every effort will be made to do so in the case of rejected communications. Where such are regarded as of value, correspondents are requested to retain copies.

The Editors do not hold themselves responsible for the opinions expressed by their correspondents, or for statements and facts which do not appear in the editorial columns.

The Editors and Publishers beg also to state that they will accept no responsibility for unsolicited contributions, even if used, unless payment for same is directly specified in forwarding, and the terms arranged before publication.

To insure insertion communications and contributions must be in the Editors' hands by Wednesday forenoon of the week in which the same are intended to appear. Disappointment may be caused by non-compliance with this rule, and to avoid this earlier receipt, if possible, is necessary.

# THE Motor-Car Journal.

Vol. I.]

LONDON, FRIDAY, AUGUST 18th, 1899.

[No. 24.

Published Weekly by CORDINGLEY & CO., 39 & 40 Shoe Lane, London, E.C.

## COMMENTS.

### Popularising the Motor-Car.

THE Motor Touring Company, Ltd., of which Mr. T. Morrison is manager, has just struck out a new line, viz., that of running a motor-wagonette to places of interest in the neighbourhood of Birmingham. The vehicle has seat-

ing accommodation for fourteen passengers. With Stechford station as the starting point daily trips are being made this week—Sunday's run being to Stonebridge and Wednesday's to Sutton Coldfield. When in Wandsworth, S.W., the other day, too, we noticed that someone in that district is announcing short excursions on a seven-seated wagonette—a Daimler, we believe; last Saturday's run in this case being to Virginia Water and back. In both cases the fares are extremely low, and we trust that the enterprise of the organizers will be duly rewarded. The excursions offer a splendid opportunity to those who are still unacquainted with the pleasures of motoring.

### Raising the Speed Limit.

IN our last issue we mentioned that the trials of heavy motor-vehicles which are being conducted by the Automobile Club of Great Britain on behalf of the Local Government Board with the view of an increase in the limits of the speed of such vehicles weighing unladen over 1½ tons were to have taken place on Friday last, the 11th inst. We learn from the Secretary of the Automobile Club that circumstances arose which necessitated the postponement of the trials until to-day, the 18th inst. The experiments will probably take place before Major-General Phipps Carey (the Chief Engineer of the Local Government Board), two of the Board's Inspectors, and its Secretary.

### Police-Court Mixtures.

FROM the veracity of the constable and the confiding magistrate who believes everything that comes from the lips of those in the dark uniform, complaint seems to be veering to the police-court itself, and our correspondence columns of the last two weeks let light upon a matter that is undoubtedly an indignity and hardship. There is need for classification and discrimination in cases that come before the magistrates, and some distinction should be drawn between the man who gets drunk and knocks his neighbour about and the man who halts his motor-car on the suggestion of a policeman who fancies he can calculate the speed at which it is going. As the matter stands, a summons at a police-court necessitates the waste of a day, and very often the fine, if one is inflicted, is a very trivial one. Surely the business could be arranged so that these matters, which do not come under the category of criminal offences, could be disposed of early in the morning while the air of the court is comparatively pure, and the place then left wholly in the occupation of the class of people so graphically described by the gentleman who opened the discussion in our columns last week. At present the persons composing a police-court audience are offensively various—a veritable "mixture."

### English Car in a Continental Race.

THE Hon. John Scott Montagu, M.P., has entered his British-made Daimler car in the touring class in connection with the Paris to Ostend race. The Hon. C. S. Rolls, on his 8-h.p. Panhard, will also be a competitor; and a twin-motor Daimler car from this country will take part in the race. Britishers need more knowledge of such contests as have popularised the motor-car abroad, and the presence of a goodly number of English automobilists at such a gathering as that which will assemble in Ostend on the 1st prox. should lead to the inauguration of some useful and practical contests in this country. We hope the British motorists will achieve distinction in the forthcoming contest. Probably the advocates of Peace among the nations will welcome the entry of a British M.P. in a Continental race as the beginning of a series of contests between the legislators of different countries, all calculated to bring the leading men of Europe into personal social intercourse. "There's no telling what the motor-car may not do," as the Irishman said when he rose from the ditch and saw his vehicle waiting for him about a hundred yards off.

### Motor-Cars on Hire.

IN addition to the regular motor-car services which have been established in many populous localities there are several places where people can enjoy the novelty of being able to take short trips by motor. At Clevedon Mr. Stephens has introduced a motor-car for short trips in and about the town. It is of 3 h.p. and of his own design. At Gravesend Mr. Baxter of the Aerolyte Cycle Co., Harmer Street, Gravesend, has taken out a licence to work a motor-car on hire, the vehicle selected being a 3-h.p. Benz Ideal, and we understand the company intend shortly to obtain others for the convenience of private parties and local business firms. From Enfield Messrs. Olley & Co. almost daily organize excursions by their motor to places in the Eastern Counties, Cambridge and Yarmouth being particularly favourite towns with the people of Enfield. By going such long distances Messrs. Olley & Co. are doing good work in popularising the motor-car, and we hope the enterprise of Mr. Baxter at Gravesend will be similarly successful.

### Another Exhibition.

RECOGNISING the public interest in automobilism, the Royal Institute of Public Health is adding a motor-car section to the exhibition in connection with its forthcoming congress at Blackpool. We gladly welcome these subsidiary shows at such gatherings as educating the public, but they will prove of little value for really business purposes, as very rarely do they attract the class of people likely to become owners of cars. What is now most urgently wanted is a series of tests and trials systematically conducted in various parts of the country to demonstrate to business people the reliability of motor-vehicles. The trials from the Agricultural Hall through Hertfordshire, the recent important tests at Liverpool, and the suggested run from London to Edinburgh under the auspices of the Automobile Club are

means of proving the commercial character of the motor-car, and the multiplication of such contests properly arranged in every part of the country would give a great impetus to the industry. The public should not be taught to regard the automobile merely as a thing to look at but as a practical means of dealing with road traffic.

#### Motor-Vehicles and Railway Cartage.

MR. J. A. F. ASPINALL, the general manager of the Lancashire and Yorkshire Railway Company, is the first railway manager to practically consider the utility of motor-vehicles in connection with railway cartage work. We understand he intends to give the 6½-ton Thornycroft steam lorry and trailer which won a gold medal at the Liverpool trials a

SIR DAVID SALOMONS ON HIS DE DION TRICYCLE.

Photo by

G. Glenville, Tunbridge Wells.

full test in railway work, and should it prove as successful as other tests that have been made, interesting developments may be expected on other railways as well as the Lancashire and Yorkshire system.

#### Petroleum Spirit.

ACCORDING to the report of Mr. Alfred Spencer, the chief officer of the Public Control Department of the London County Council, the use of petroleum spirit in motor-cars does not appear to have developed to any great extent during the past year. The Council's officers have reported on about a dozen premises where petroleum spirit is kept for this purpose, under the Secretary of State's regulations, but in the absence of any obligation on the part of motor-car owners to notify the local authority when they are keeping petroleum spirit for use on motor-cars, it is difficult to estimate the extent to which petroleum spirit is at present used for this purpose. Any one who has observed the progress of the motor-car industry will smile on reading the statement as to the development in the use of petroleum-spirit in motor-cars. We are glad that the Secretary of State's regulations do not insist on owners of cars being worried into declarations, affidavits, etc., and the taking out of licences, for

there is a great difference between the storage of the spirit in large quantities for sale and the keeping of that required for use in one's own car.

#### Do Ladies Like Motoring?

BETWEEN the *Court Journal* and the *Daily Telegraph* who shall choose? The former declares that "in the few good English watering-places not yet given over to the summer tripper there are plenty of automobiles, and the fair sex has deserted bicycling for this easier means of progress through the country." On the other hand, the *Daily Telegraph* says that "ladies do not seem to take very enthusiastically to motor-cars as a means of getting about in these holiday times." Our own impression is that ladies are quite as much enamoured of motor-vehicles as the sterner sex, and the delights of a run through the country on a motor-car afford ample compensation for the dust, which, according to the *D.T.*, is a great objection on the part of the fair sex. But we do not wish to set our two contemporaries at loggerheads, and gladly recognise they are agreed that "the motor-carriage," to quote the *Court Journal*, "is making as much headway socially, in proportion to price, as the safety bicycle was accomplishing three years ago." This finds confirmation in the *Telegraph's* report of long tours on motor-cars by the Duke of Manchester, the Duke of Leeds, and the Earl of Carnarvon.

#### The Motor-Cabs of Paris.

THE decision of the Compagnie Générale des Voitures à Paris to remove the numbers from their cabs, which will therefore no longer ply for hire at the second class or ordinary *fiacre* rates, has been seized upon by our contemporary, the *Daily News*, as furnishing another proof of the triumph of the horse in the question of cost, and up to a point we must agree with the reasonings of our contemporary. Electricity, which at present is the most expensive method of the more generally used means of mechanical propulsion, undoubtedly costs more than horse-flesh where a limited number of vehicles are employed, but had the Paris Company been able to place upon the streets say fifty cabs, we feel sure that easier terms could have been made with the drivers, and so have enabled the Company to have secured a more satisfactory margin of profit than that hitherto obtained. The dead charges on fifty cabs would be but a very slight increase on those for twenty-five, and the money-earning capacity probably double. But the Company, in common with many other motor companies, was not in a position to work on the most economical basis, and accordingly the price charged the drivers did not enable them to profitably run the vehicle at ordinary fares. While not suggesting that petrol motors are entirely suitable for this class of work, we believe that from a commercial point of view they could be run infinitely more profitably than vehicles propelled by electricity at the present time, and at fares if anything lower than those in force for the second class *fiacres* of Paris.

#### Motor-Cars in Lowestoft.

WE have received from a lady correspondent, who styles herself "Miss Suburban Villa," an eulogistic account of the conveniences and pleasures experienced in motor-caring at Lowestoft. She states that the vehicles of the Lowestoft Motor-Car Co., of which Mr. H. C. Adams is secretary and manager and Mr. O'Driscoll the active agent in the town, supply visitors to the popular resorts of Lowestoft and Yarmouth with a ready means of enjoyment as well as a great convenience, owing to the somewhat scanty service of trains between those points. Further, that the vehicles are kept in the best possible condition, and that their speed with a load of eight persons leaves nothing to be desired. Mr. O'Driscoll, who, as it were, acts as chief traffic agent, is a well-known tradesman in Lowestoft, his establishment at the foot of the bridge leading to the South Shore being known to

everyone visiting Lowestoft. Mr. H. Adams is the son of a late Mayor of Lowestoft, and is also a well-known tradesman, and it appears that the service of cars is run on the same strict business lines that has proved successful in bringing these two gentlemen, together with others associated with them, to the "top of the tree" amongst the traders of Lowestoft. We wish the undertaking every success, which, indeed, appears assured, if the account of our correspondent is to be taken seriously. We understand that this Company is about to become the sole agents of the Motor Manufacturing Company, Ltd., of Holborn Viaduct, E.C., and Coventry, in Lowestoft and Beccles.

#### A New Car.

A NEW light motor-carriage is, we learn, in course of construction at the works of Messrs. James & Browne, engineers, Buckingham Palace Road, London, S.W. The vehicle is being provided with two 2-h.p. petroleum-

spirit motors, with water-jacket and electric ignition. A special feature of the motor is, we understand, the readiness with which the valves and other working parts can be removed. Two speeds are provided by means of chain gear and friction clutches, while a single central chain-drive will connect the counter-shaft with the rear road wheel axle. We hope to give a full description of the new vehicle as soon as it is completed.

#### The Trans-American Automobile Tour.

IT is apparent that the Trans-American trip of Mr. and Mrs. Davis in an automobile is not proving a glowing testimonial to the American vehicle. One of our American contemporaries, in commenting on the

trip, remarks: "Something is wrong with either Mr. Davis or his machine. His journey thus far has been a continuous chapter of mishaps and delays. It is doing the infant industry no good. If Davis can do no better he should be called off, and someone else sent over the route to regain the loss of prestige."

#### A Policeman Actually Mistaken!

WE commend to those provincial magistrates, particularly the "judicial" authorities at Guildford and Newcastle, who are inclined to place implicit faith in the speed-judging eye of the policeman, the report of the case at the West

London Police-court appearing in another column. The Hon. Charles Rolls, one of the most expert motorists in this country, and Mr. Hutton, have appeared before Mr. Rose charged with driving a motor-car at an alleged rate of 14 or 16 miles an hour. Not only did these gentlemen deny the speed, the former asserting that the car he was driving—a Columbia electric car, the property of Mr. Harmsworth—could not attain more than nine miles an hour, but Professor Vernon Boys and Mr. R. E. B. Crompton also gave technical evidence controverting the policeman's "imagination." It will appear strange to the average country magistrate that after such evidence the London magistrate was satisfied that the constable had been mistaken, and dismissed both summonses—although why he should not have allowed costs none but a magistrate can understand. His suggestion that "motor-cars seem to be associated with an optical delusion, as they appear to travel faster than they actually do," should be remembered by magistrates and policemen alike.

#### A "Paralysing" Car.

THE "effects of motor-cars on animal and human nature" is a subject we would suggest to the Royal Society for the Prevention of Cruelty to Animals and that which similarly deals with cruelty to children, as suitable for an

essay in their school competition of 1900. The former society annually invites pupils in elementary schools to write,

with prizes as an incitement, on topics which are calculated to encourage kindness to animals. Now, in the opinion of some people the motor-car is an abomination intended to alarm horses, frighten sheep, irritate cows, and seriously disturb the tranquility of nursemaids with perambulators conveying human freight. All that we know; but according to a resident of the Isle of Wight the automobile is not so dreadful after all, and a particular car owned by Mr. W. P. Bugslocke, of Ryde, has been going at "a pace enough to paralyse children," or, in other words, fix their attention—as was the case of the Ancient Mariner. That motor car should be encouraged, and its spirit-quelling character introduced into other vehicles, for hitherto only the shying, kicking, and running instincts of animals have been excited—or alleged to be excited—by motor-cars. A car that can paralyse children and also be adapted to similarly quieten vicious animals should not be lightly passed by. And we would suggest to the two anti-cruelty societies named the advisability of bringing it prominently before the public, either in the competitions we have mentioned or by some other means.

#### A Comparison of Accidents.

OUR French contemporary, *Le Vélo*, compiles month by month a most interesting and instructive table showing the total number of automobile accidents in France as compared with those resulting from the use of the noble

horse, and this comparison during last month emphasises more than ever the increase of safety which is secured by employing the automobile. The figures are more striking, perhaps, on account of the publicity given to all motor-car misadventures, while those relating to horse-drawn vehicles, if mentioned at all, are dismissed with the briefest of notices and entirely devoid of harrowing details. Here are the figures: Horse accidents in France during July, 848 (resulting in 78 deaths and 770 wounded); automobile accidents in France during July, 31 (resulting in 4 deaths, and 27 wounded). Granted that the horse-drawn vehicle outnumbers the automobile very considerably, still the comparison of figures is truly remarkable.

#### A Long-Distance Run by a Steam Lorry.

WE learn that Messrs. Clarkson and Capel's steam lorry, which left Liverpool on Tuesday afternoon last week with a load of crystal carbonate of soda from the Gaskell, Deacon's Works of the United Alkali Company, reached

London safely on Monday last. Considerable delay was experienced in obtaining water in the country at various points of the route, owing to the drought. The vehicle also stopped some hours at Meriden to take up an additional load of machinery. The car caused some excitement in Birmingham, where, in proceeding down the steep Bull Ring hill, the brakes proved insufficient to control the vehicle, which mounted the pavement and endeavored to make its way into a cycle dealer's shop—this being, however, the only serious incident of the journey. The trip was purely an experiment, as it has never been suggested that a motor-wagon—unless for goods adversely classed by the railway companies—is a commercial means of transit over so great a distance. The route followed was *via* Warrington, Sandbach, Cannock, Birmingham, Coventry, Daventry, Penny Stratford, and St. Albans, which is some forty miles longer than the direct road to London, and therefore makes the journey the longest on record for a laden motor-wagon.

THE Canadian Postmaster-General has decided to give the automobile a test in the work of collecting letters and in carrying mail to and from the general post-office in Toronto to the branches. A sum of money for the purpose has been provided for in the supplementary estimates, and within a short time automobiles will be purchased for use by the Toronto postal authorities.

## THE MORS CARRIAGE.—I.

By VELOX.

THE intention of the present series of articles is to give an exhaustive review of the motor, mechanism, and general details of the now well-known motor-vehicles manufactured by the Société de l'Electricité et Automobiles Mors, 48 Rue du Theatre, Grenelle, France, and vended in this country by the Automobile Association, Ltd., of Prince's

Road, Holland Park Avenue, London, W.

Peculiarly enough, although a large number of these vehicles have been sold in this country, there does not at present exist any general description of the vehicle, its motor

forms of vehicles equipped with the four-cylinder engine of these makers; for whatever the form of the body may be, the mechanical details remain unchanged.

Before proceeding to describe the various parts in detail, it will perhaps be better to briefly pass in review the general arrangement of the mechanism and equipment. The motor has four cylinders placed in pairs at an angle of  $45^\circ$ , each pair forming an angle of that degree with its fellow pair. This arrangement of the cylinders not only materially economises space, but permits the development of such a power in a given space as would be impossible were any other disposition of the cylinders followed. Besides economising room both in height and width, this arrangement permits of easy lubrication, and, indeed, these inclined cylinders possess all the advantages of vertical motors so far as perfection of lubrication is concerned. In engines having cylinders placed horizontally it is generally known that the uniform distribution of the lubricating agent is a matter of very considerable difficulty. By inclination of the cylinders in the Mors motor

1. Quantitative control of gaseous charge to cylinders.

2. Cock controlling spirit supply to carburettor.

3. Admission of air to carburettor.

4. Belt tension.

5. Lever for transferring belts from loose to fast pulleys.

6. Commutator switch.

7. Interruptor switch for cutting out current.

8. Cooler or condenser.

9. Brake lever.

10. Exhaust box.

11. Lever controlling "Devil" or "Sprag"

12. Axis of "Devil" or "Sprag" lever.

13. Pipe for circulating water.

14. Pedal controlling brake and connected to belt-shipping gear.

FIG. 1.—THE MORS DOG CART, GENERAL THREE-QUARTER FRONT VIEW, SHOWING DETAILS VISIBLE WHEN VIEWED FROM THIS POSITION.

and mechanism, and it is proposed to fill this void by the present description.

Speaking in general terms, the mechanical details of the Mors carriages are held by "the man in the street" to be particularly complicated and difficult of ready description. This, however, is one of the many popular errors existing in regard to all types of motor-vehicles, and although to the tyro the "complications" may appear excessive, it is hoped that these articles will entirely dispel any such delusion, and at the same time afford users and possible purchasers of the Mors vehicles a ready means of becoming intimately acquainted with the "internal economy" of perhaps one of the many French motor-vehicles imported into this best country.

For the purpose of making these articles more valuable it is proposed to take the most popular form of these vehicles, the 8-h.p. dog-cart, fitted with engines having four cylinders and the customary form of electrical ignition apparatus. The vehicle itself is of a particularly happy form, in that its general contour accommodates itself most readily to its mechanical equipment. It must be understood, however, that the following description applies not to the "dog-cart" only, but to all

this difficulty is obviated. The four cylinders are kept cool by a compound system of heat radiation. The crank ends of the cylinders are cooled by means of radiating discs placed circumferentially around them, whilst the heads of the cylinders—that is to say, the explosion chambers and the parts adjacent thereto—are cooled by means of a constantly circulating stream of water carried in a jacket surrounding the walls of the cylinders.

The ignition of the explosive charges of gaseous vapours is effected by electricity, and it is perhaps owing to the perfection of the system adopted that the Mors vehicles are so generally successful in operation. When the motor is first started the necessary current is taken from a battery of accumulators. When the motor attains its proper speed, however, this source of supply is cut out, and the current is furnished directly by a small dynamo actuated by the motor itself; subsequently any excess of current generated by the dynamo is utilised to re-charge the accumulators used when first starting the engine.

Power is transmitted from the motor shaft through belts to a secondary or intermediate shaft, and from thence to the road wheels through chains by means of sprocket wheels.

The changes of speed and the putting of the motor in and out of gear with the road wheels is carried out on the intermediate shaft. Lubrication is automatically effected by means of a system of chains and spur wheels fixed on the motor shaft, and the circulation of the cooling water and the driving of the dynamo are also controlled by similar means.

The driver of the vehicle has the whole of the controlling mechanism well within his reach. As these various parts are described in detail, the extreme convenience of the arrangement of these items of the control mechanism will be increasingly appreciated. The seating arrangements are such that the driver suffers no interference of vision, although one passenger, or even two if necessary, can be carried on a seat in front of him. In front of the driver is placed a handle bar somewhat similar to that of a bicycle, by means of which the direction of the vehicle is controlled. This handle bar carries two handles, one being horizontal and the other placed vertically at right angles. It is thus possible to steer the carriage with either hand or with both, although it is generally customary to use the left hand for the purpose, the right hand being left free to manipulate other items of the control gear. The vertical handle is placed on the left-hand end of the handle bar, and as the description proceeds it will be appreciated why the left hand is more generally used for steering.

The handle bar is, of course, carried on a steering post, which in its turn is carried in the interior of a vertical hollow pillar. In the centre of the handle bar is carried a commutator switch having a dial on which is engraved, in positions corresponding to notches in its edge, the following: "Stop," "Accu.," "Dyna.," "Ch. 1.," and "Ch. 2." When it is desired to start the motor the switch is turned from "Stop" to "Accu.," and the accumulators at once commence to supply current to the induction coil, and thus the necessary "sparks" are furnished for the explosion of the gaseous charges in the motor cylinders. The first impetus of the motor has, of course, been given by means of the customary starting handle usual with all types of impulse engines.

Before the starting handle is used, however, the driver has of course opened the cocks controlling the admission of air and spirit to the carburettor. These cocks are placed on the right-hand side of the driving-seat at about the height of the calf of the driver's leg when seated. They are thus within easy reach of his hand. Equally, of course, he has opened the quantitative control cock for the admission of the gaseous charges to the cylinders. This is controlled by a small lever working in a rack placed on the outside of the carriage on the right-hand side in such a position that it is reached easily when the right hand is permitted to hang naturally outside the car.

(To be continued.)

A MOVEMENT is on foot to secure the establishment of a motor-car service in the West End of Newcastle-on-Tyne.

L'AUTOMOBILE CLUB DAUPHINOIS is the name of a new society which has just been formed at Grenoble (France), with Dr. Pegoud as first president.

LA SOCIÉTÉ NOUVELLE DES ACCUMULATEURS FULMEN, Clichy (18 Quai de Clichy), France, is the title of a new company which has just been registered with a capital of £22,000.

We learn that Messrs. Heinle & Wegelin, of Oberhausen, Augsburg, Germany, have been awarded a gold medal for their exhibit of motor-tricycles and trailing cars shown at the German Sports Exhibition at present being held at Munich.

THE James Gould Company of Albany, N.Y., has received an order from the Columbia and Electric Vehicle Company of Hartford, Conn., for fifty automobile hansom cabs, to be equipped with the latest electric motors. The manufacturers intend, it is stated, to make these vehicles much lighter than any heretofore devised, partly by means of an improvement in the storage batteries.

## AN INGENIOUS AND VALUABLE APPLIANCE.

SOME time ago we had the pleasure of alluding in general terms to the "Mensor" chronograph and speed recorder, introduced into this country by Mr. Robert S. Roberts, of 100 The Parade, Leamington.

We then stated that from a cursory examination the appliance would appear to be of undoubted value to automobilists, and promised that if possible we would give the apparatus an extended test and report results to our readers. By the courtesy of Mr. Roberts we have now been able to fulfil our promise, and have given this apparatus, through the kindness of a well-known automobilist, an exhaustive and almost daily test over a period of about two months. The appliance was used throughout the whole of the trials of the Automobile Club at Richmond, during the *Motor Car Journal's* Commercial Efficiency Tests at Islington, and on other days in private runs and on tours. It has also been used to test speeds of railway trains, horse-drawn vehicles, motor-tricycles, and even for gaining a knowledge of the speeds of pedestrians, so that these tests have been of a widespread character, and cover various speeds of from four miles per hour of a pedestrian to ninety-six miles per hour on one of the fast expresses of the London and North-Western Railway.

The apparatus is, in fact, an ordinary chronograph stop-watch, with the addition of another dial registering speeds. The speed dial has four scales upon it, each scale being figured in different colours. The scale to be read at any one time is designated by a small scale pointer working synchronously with all other parts of the watch.

By means of this apparatus it is possible to at once determine the rate of speed of any moving body, so long as that body traverses between two points the distance between which is a known quantity and a unit. It matters not whether the distance be versts, leagues, kilometres, miles, yards, metres, or any other known measurement, the apparatus instantaneously and automatically records the number of these traversed in an hour with absolute accuracy and incontrovertible fidelity.

The whole value of the appliance arises from the second or speed dial. The hands of this move synchronously with the centre-seconds, or chronograph hands of the watch dial. The fidelity of the record is therefore indisputable, for it follows that if a body takes 30 secs. to travel a unit of length, the speed of that body is 120 units per hour. In working, the chronograph is started at the instant of the moving body crossing the starting point of the known distance—a milestone, for instance—and it is stopped on passing the terminal point of this distance. Automatically, the time taken to travel the distance is recorded to a fifth of a second, and synchronously in the speed dial the rate of units travelled per hour is also recorded.

In actual practice we have found the appliance equally reliable for all speeds, and although on receipt of the apparatus from Mr. Roberts we found that the watch movement required regulation and adjustment, after this was done the variation of the watch for the two months was found to be considerably under one second. We can heartily commend this ingenious appliance, therefore, to all those who would like to ascertain the speed of travel per hour without having to undertake laborious and troublesome calculations as to time occupied and distance traversed.

"AUTOMOBILETAXAMETERDROSCHKEN" is the name by which the motor-cabs plying for hire in Berlin are known!

THE Tractor-Truck Automobile Co. has just been organised at Camden, N.J., to construct vehicles to be operated by compressed air, electricity, etc. The capital is £500,000.

## THE RENAUX MOTOR-TRICYCLE.

SO much has lately been heard of the Renaux motor-tricycle and the wonderful performances made on it by its designer and builder that a description of the machine, with illustrations, may not be without interest at the present time. The tricycle (Fig. 1) differs from those of the De Dion type in that it is provided with a horizontal motor. It is stated to be capable of working up to 3 h.p. at a normal speed of 1,200 revolutions per minute. It is located between the bottom bracket and the rear axle, its horizontal position being claimed to greatly reduce the amount of vibration experienced in motor-tricycles. There are a number of special features in the motor (Figs. 2 and 3), one of which is that the piston rod is connected by means of a satellite pinion to two toothed wheels which form the differential. Referring to the illustrations (Figs. 2 and 3) it will be seen that the cylinder *C* terminates in a case *B* in which are located two fly-wheels *V V'*, each forming part of the bevel wheels *E E'* of the differential, mounted on the

FIG. 1.—THE RENAUX MOTOR-TRICYCLE.

FIGS. 2 AND 3.—PART SECTIONAL VIEWS OF RENAUX MOTOR.

two parts of the motor shaft *A A'*. The head of the connecting rod *d* forms a collar *b* in which can turn a disc, carried by pins, connecting the two fly-wheels *V V'*. The disc enclosed in the collar is provided with a recess in which is mounted a small spindle on which can turn loosely a mitre pinion *e*, which gears with the bevel wheels *E E'*, and thus constitutes with these latter a differential gear. On each of the two parts of the motor shaft is keyed a pinion *r r'* which gears with internal toothed wheels fixed on the tricycle axle. The fly-wheels *V V'* are grooved on their circumference to receive band brakes, actuated by means of the rod *t*. The motor is started in the usual way by the pedals, a clutch mechanism being provided to the bottom-bracket chain wheel, the rear chain wheel being located at *p*. The ignition device and exhaust valve is controlled by a toothed wheel *M* (Fig. 5), which gears with a pinion *m* on the motor shaft. The wheel *M* is provided with two cams, one serving to complete the primary circuit in the induction coil at the requisite moment, and the other to lift the exhaust valve by means of the rod *N* every second revolution of the motor shaft. The sparking device may be advanced or retarded by means of the rod *p*. Fig. 4 gives a section through the combined petrol tank *U*, the lubricating oil tank *V*, and the induction coil *S'*. The carburettor *R* (Fig. 1), which is located near the exhaust box *r*, also possesses novel features. The chain connecting the pedals with

the motor bears slightly on a roller, connected with which, in the carburettor, is a miniature paddle-wheel on which falls the petrol, the latter being instantly vaporised. The quantity of spirit allowed to flow into the carburettor is regulated by the handle *r*; the quantity of explosive mixture allowed to pass to the explosion chamber is controlled by the handle *r'*,

FIG. 4.—THE RENAUX COMBINATION PETROL TANK.

FIG. 5.—THE RENAUX EXHAUST CONTROL GEAR AND TREMBLER.

while the handle *q'* controls the compression cock. Altogether the Renaux motor-tricycle is an interesting machine, and by reason of the smart performances made on it by M. Renaux himself it is likely to soon become very popular. As we have already announced, the English patent rights in it have been acquired by Messrs. Marshall & Co., of Belsize Works, Clayton, Manchester, who are arranging for the manufacture of the Renaux motor-tricycle on a large scale.

## THE PIEPER ELECTRO-PETROLEUM CAR.

ONE of the novelties displayed at the exhibition at the Tuileries in Paris in July was certainly the Pieper car, which is a combination of an oil motor with a dynamo and storage battery. At first glance the idea seems ridiculous, but a careful examination shows that such a car has great advantages.

The oil motor, situated in front, acts directly on the wheels by a two-gear transmission just as an ordinary car, but the dynamo is also connected on the main shaft of the motor, so that it acts like a fly-wheel. The dynamo is connected to a storage battery consisting of a few cells. At a certain speed—say fifteen miles an hour—the electric pressure of the dynamo and that of the battery are exactly balanced, so that no current passes from one to the other. Now, suppose the car is going down hill, the motor, which has no regulator, will run quicker, and if it were not for the dynamo would "race." The dynamo, however, acts as a regulator, and directly develops an electric pressure superior to that of the battery, so that a current flows, charging the batteries. In a word, the excess of power of the motor is not utilised to go quicker down hill, but is transformed into electricity to charge the battery. On a hill the contrary takes place: the motor slows down a little, but the energy stored up in the cells is given back, so that the car goes up hill at the same pace, or very nearly so, as it went down. The consequence is that in all circumstances the oil motor gives out the same power, and therefore works under very economical conditions.

Supposing, for instance, the motor gets out of order, the charge of the battery will be sufficient to run the car a distance of over twenty miles, an advantage that many people will appreciate.

We hope shortly to be able to give a full description of this interesting car, which well deserves the public attention.

D. FARMAN.

A FEATURE of the fourth annual Manchester cycle and motor exhibition, which is to be held at the Royal Botanical Gardens, Old Trafford, is expected to be the display of motor-cars.

## CORRESPONDENCE.

### THE PARIS-OSTEND RACE.

TO THE EDITOR OF *The Motor-Car Journal*.

SIR,—In answer to inquiries recently made, the enclosed letter has been received by the Automobile Club.

Yours faithfully,

The Automobile Club,  
August 10th, 1899.

C. JOHNSON,  
Secretary.

[TRANSLATION.]

Sir,—In reply to your letter of the 3rd inst., I have the honour to inform you that, in accordance with the new regulation concerning the running of automobile carriages in France, every driver should be furnished with a certificate of capability, and his carriage should be of a type approved of by the Office of Mines. The regulation not making provision for any exception, I can only give you the text of the law just as it stands.

Many "chauffeurs" neglect this formality, but they do so at their own risk and peril, and are liable for the contravention of the rules on being detected.

If the "chauffeurs" arrive on the eve of the race, it is certain that they will have no time to conform to the requirements of the regulations; for this, it will be well for them to arrive in Paris at the earliest possible moment.

The Customs duties deposited with the Customs House on the importation of automobile carriages into France are refunded by all the French bureaux. These fees can therefore be refunded on passing the Belgian frontier. As these formalities always take time, and a race under these conditions will be more possible, it is probable that the organizers of the Paris-Ostend race have made provision (as we did in the Paris-Amsterdam race) for removing all difficulties for the passage of vehicles to the frontier. In this way, those taking part will be able after the race to receive back the fees deposited on coming back to the frontier.

It is said, besides, that to simplify matters the finish of the race will be at the frontier, and the journey of 40 kilometres between the frontier and Ostend will be made *en promenade*.

Believe me, etc.,

DE MORLHON,

Secrétaire Automobile Club de France.

Paris, August 8th, 1899.

### ACCUMULATORS FOR ELECTRICAL VEHICLES.

TO THE EDITOR OF *The Motor-Car Journal*.

SIR,—Referring to the expressed want of electric motors (particularly for use in the country) which can be charged in a more simple manner than by means of dynamos, I should be glad if any reader can give his personal experience of the Boron-Carbon battery (made at Everton, Liverpool), which the prospectus says can "replace with advantage either dynamos, accumulators, or other electro promoters." I notice that a firm of motor builders at Hull state that the "cells have given every satisfaction." It may be feasible with these to charge sufficient accumulators to obtain some 3 or 4 h.p. It will be to the great advantage of motor builders to simplify the motive power.

Chardstock,

August 14th, 1899.

Yours truly,

COUNTRY RESIDENT.

### MOTOR-CARS AT THE SEASIDE.

TO THE EDITOR OF *The Motor-Car Journal*.

SIR,—I wish to point out to your readers, especially the manufacturers, a very great defect which goes a long way to bring motor-cars into disrepute.

It appears from my experience in running the cars for passenger traffic that the vehicles can never be depended on. I book passengers to different points of interest, and then when I have a full list and they are waiting for the cars, I have to go in search of the cars and find there is a something wrong and they cannot run. This naturally causes considerable annoyance. One would not mind if the occurrence was an occasional one, but it has been going on daily now for three months. I should be glad to know if there are cars produced that have not these defects.

The Library, Eastbourne,  
August 14th, 1899.

Yours truly,

THOS. S. GOWLAND.

### A MOTOR COMPETITION.

TO THE EDITOR OF *The Motor-Car Journal*.

SIR,—With reference to the competition of motors which is being organized by *La Locomotion Automobile*, I really do not see exactly what value such tests will have. First, how are the cars to be tested, and how will their comparative value be obtained? As far as consumption of fuel (petrol) goes, naturally the car which has the largest h.p. will consume the most per kilometre, and the most economical will prove to be a light car fitted with a De Dion motor. As for the consumption per h.p. on the brake, I am afraid it will be very much the same for any car, and in that case an ordinary Benz vehicle will be equal to the latest type of Panhard car.

The real desideratum at this early stage of automobilism is the reliability of a car, and the best is certainly that which will go over the greatest number of miles without incidents or repairs, etc. From this point of view I think no better test can be obtained than a long race (as the Tour de France), in which no part of the engine or car could be replaced.

Paris,

August 15th, 1899.

Yours truly,

"CARBURETTOR."

### AN UNNECESSARY INDIGNITY.

TO THE EDITOR OF *The Motor-Car Journal*.

SIR,—"A Gentleman" hits the nail on the head in drawing attention to the unnecessary indignities which are thrust on automobilists and their witnesses who are called upon to pay a visit to the local police-courts. It is not sufficient that motor-car owners may be stopped and "booked" by any policeman who *imagines* that the car is being driven at some remarkable speed, but when they are called upon by a summons to appear before the magistrate the treatment is nothing short of scandalous. Not only is one compelled to wait about, often for hours, among a crowd of most uninviting characters, but even when the case does come on one is compelled to listen to the wonderful tale told by the constable, which, on the face of it, is more often than not simply absurd, but on which the majority of magistrates appear to base more reliance than on the evidence of any number of witnesses on behalf of the defendant.

Fortunately, I have so far escaped the eye of the imaginative policeman, but should it be my lot to be summoned I have fully made up my mind that it will be wiser not to put in an appearance and allow myself to be fined than to waste a day at the police-court—for that is practically what it means—in undesirable surroundings in a, most probably, futile attempt to prove to the magistrate that the policeman was mistaken.

Kingston,

August 14th, 1899.

Yours truly,

A BUSY MOTOR-CYCLIST.

THE SOCIÉTÉ DES VOITURES AUTOMOBILES DECAUVILLE, of Paris, owing to the success of their little voiturettes, are now taking up the manufacture of a somewhat similar type of vehicle, but with accommodation for four persons, and driven by a motor of either 5 or 8 horse-power provided with a water-jacket. The new carriage, which is very elegant in design, has four forward speeds and one backward, and, like the smaller pattern, is driven without belts or chains.

A PAPER by Prof. G. F. Sever and R. A. Fleiss read at a recent meeting of the American Institute of Electrical Engineers gives some interesting information regarding the relative economy of horse and electric delivery wagons. The authors have found that the average delivery wagon covers a distance of about 11,268 miles per year, at a cost of 13.86 cents per mile for a two-horse vehicle. An automobile will cover the same distance for 2.65 cents per mile less, equivalent to 298 dols. 60 c. per year. A further advance is the higher speed of the electric vehicles, enabling the deliveries to be accomplished with greater celerity.

## MOTOR-CARS ON THE CONTINENT.

## Automobiles in Italy.

We understand that it is proposed to establish a regular service of automobiles between Oneglia and Garesio, the route to be followed being *via* Pontedassio, Chiusavecchia, Cesio, Piere-di-Teco, Pornassio-Acquatico, Case di Nava, Ormea and Trappa. The type of vehicle decided upon is an omnibus fitted with a steam motor developing 30 h.p., which should be amply sufficient to negotiate the steep hills encountered *en route*. The load is to be ten passengers and baggage. Doubtless, tourists will largely avail themselves of this means of communication between the various towns, and if the service proves successful others of a similar nature will be forthcoming.

## The Nice Week.

THE programme of the annual automobile fêtes at Nice organized by the Automobile Club of Nice, under the patronage of the Automobile Club of France and the Automobile Club of Marseilles, has just been issued, and it is to be sincerely hoped that English automobilism will be worthily represented at this truly brilliant festival. The official programme in a condensed form is as follows:—First day, Sunday, March 25th: 2.30 p.m., procession of decorated automobiles on the Promenade des Anglais. In the evening there will be held a torchlight procession and a reception at the Automobile Club. Second day, Monday, March 26th: Race, Nice-Marseilles, *via* Cannes, Fréjus, Le Muy, Draguignan, Carcès, Brignolles, Saint Maximin, Tretz and Gardanne. Exhibition of competitors' cars at Marseilles. Third day, Tuesday, March 27th: Race, Marseilles-Nice, *via* Aubagne, Roquevaire, Saint Zacharie, Saint Maximin, Brignolles, Flassaus, Le Luc, Vidauban, Fréjus and Cannes. In this race, Nice-Marseilles and return, there will be four categories: 1, racing cars; 2, touring cars; 3, voiturettes of less than 400 kilos.; 4, motor-cycles. The jury will determine in which series a vehicle can compete, and their decision will be final. The prizes will probably amount to 10,000 francs. Fourth day, Wednesday, March 28th: Obligatory exhibition of the vehicles which have competed in the race Nice-Marseilles-Nice. Fifth day, Thursday, March 29th: Mile race on the Promenade des Anglais. This race is obligatory for all the competitors in the 1st, 3rd and 4th series of the Nice-Marseilles race. Sixth day, Friday, March 30th: Race, Nice-La Turbie. Obligatory for all competitors in the 1st, 3rd and 4th series of the Nice-Marseilles race. In the afternoon there will be held a competition for elegance of design.

## Racing at La Rochelle.

ON Monday last at La Rochelle two events were decided, the one being open to "motor-cycles," the other reserved for "motor-cyclettes." In the former class a noteworthy performance was achieved by Béconnais, who covered the distance of 188 kilometres in 3 hours 13 minutes, averaging 58 kilometres 500 metres per hour. 188 kilometres in 193 minutes is not bad travelling. The other placed riders were: 2, Rigal, 3 h. 58 m.; 3, Bertin, 3 h. 59 m.; 4, Duanip, 4 h. 20 m. The cyclettes were required to travel 128 kilometres only, and the race resulted as follows: 1, John Léonard, 3 h. 11 m.; 2, Maurice Bucquet, 3 h. 37 m.; 3, Louis Cousin, 3 h. 52 m.

## A New Car.

M. PAUL GEORGE, in conjunction with M. J. Lemaitre, is now experimenting with a new car, which is fitted with a special 5-h.p. horizontal motor. The car is of simple construction, and is to be sold at about 5,000 francs (£200).

## Criterium of Voiturettes.

IN September next "*Le Sport Universel Illustré*," which has already organized the "criterium" of electric vehicles, is going to do the same for the voiturettes. Light vehicles for two persons are only admitted in this competition, and no doubt they will be numerous. Unfortunately, up to now this class of vehicle, so much demanded by the public, is very far from perfect. Let us hope the criterium will reveal the "*rara avis*."

## Races at Lorient.

ORGANIZED by M. Teste, there took place at Lorient on Sunday last a most successful day's racing, the principal events being as follows:—Local race—heats of 5,000 metres, final 6,500 metres: Winner, Berthou, 9m. 39s.; second, Teste. International race—heats of 5,000 metres, final 9,750 metres: Winner, Berthou, 13 m. 50 s.; second, Teste. In this event Hughes held a lead of 500 metres after 6,000 metres had been covered, and then met with an accident to his motor, otherwise the victory would assuredly have been his.

## The Barrière Tricycle.

THAT one does not see many of these machines in Paris is accounted for more by the very limited output of the makers than anything else, as those in use appear to give every satisfaction. The other day we had an opportunity of testing the hill-climbing capabilities of this tricycle in the neighbourhood of Champigny, La Varenne, and Boissy St. Léger, and were astonished at the ease and rapidity with which it ascended several very steep grades.

## Le Criterium de l'Est.

UNDER the auspices of "*Le Véloce Club Vityrat*" this race was decided on Sunday, over a course of about 110 kilometres. The winners were—1, Thevenet; 2, Robert; 3, Peron; 4, Lenfant. The first-named covered the distance in 2 h. 25 m. 20 s.

## Prizes in Le Tour de France.

THE distribution of the prizes of "*Le Tour de France*" was made at the offices of *Le Matin* on Thursday last week, and the majority of the competitors were present in person. The distribution was as follows:—Cars: 1, René de Knyff, 6,000 fr.; 2, Girardot, 4,000 fr.; 3, Chasseloup-Laubat, 3,000 fr.; 4, Pinson, 2,000 fr.; 5, De Castelnaud, 1,200 fr.; 6, Heath, 800 fr.; 7, Clément, 700 fr.; 8, Levegh, 700 fr.; 9, Jenatzy, 600 fr. Tricycles: 1, Teste, 2,500 fr.; 2, Tart, 1,000 fr.; 3, De Méaulne, 700 fr.; 4, Degrais, 400 fr.; 5, Bardin, 400 fr.; 6, Béconnais, 300 fr.; 7, Gleize, 300 fr.; 8, Cormier, 200 fr.; 9, Rivierre, 200 fr. Voiturettes: 1, Gabriel, 2,500 fr.; 2, Théry, 900 fr.; 3, Ulmann, 500 fr.

## The Paris-Dieppe Motor-Cycle Race.

THIS event, promoted by the Association Vélocipédique d'Amateurs was run off on Sunday last, eighteen motor cyclists competing. The start was effected at St. Germain at 9 a.m., and exactly 3½ hours later the premier rider (Oury) arrived at Dieppe, his average speed being 42 kilometres per hour. Five minutes later Rodriguez finished, having experienced extremely bad luck. At a level crossing, only 400 metres from the finish, he met with a bad accident, and was compelled to push his machine the remainder of the course, thereby losing first place. The third and fourth men were respectively Cormier and Rolland.

**The Condition of M. Craninckx.**

WE are glad to say that the latest news is of an extremely favourable nature, and that M. Craninckx is now on the high road to recovery. All English automobilists will rejoice equally with those of France and

Belgium that the life of so genuine a sportsman as M. Craninckx has been spared, and will unite with us in wishing him a speedy recovery to complete health.

**More Scotte Road Train Services.**

A NEW Scotte steam road train service has just been inaugurated between Arcis-sur-Aube and Brienne, France. Three trains are in use—two for passengers and one for the transport of goods.

**A New De Dion Steam Omnibus.**

MESSRS. DE DION AND BOUTON, of Puteaux, are having built in Paris a new "body" for a twenty-four seated steam omnibus, entirely constructed of "partinium"—a new aluminium alloy, which is claimed to combine

strength with lightness.

**A New Peugeot Racing Car.**

IT is said that M. Lemaitre is having built a new Peugeot racing car, which will be fitted with a 25-h.p. engine. Certainly this car will take hills!

**Motor-Car Construction in Austria.**

THE *Oesterreichisches Handels Journal* announces that a company is in course of formation in Vienna, to establish works in the neighbourhood of that city for the construction of motor-cars.

## THE LIVERPOOL SELF-PROPELLED TRAFFIC ASSOCIATION.

A MEETING of the council of this Association was held on Tuesday afternoon, under the chairmanship of Mr. Alfred L. Jones, J.P., vice-president. The business included the election of a number of new members, and, on the motion of the Chairman, Dr. H. S. Hele-Shaw, M.Inst.C.E., and Mr. Anthony G. Lyster, M.Inst.C.E. (Engineer-in-Chief of the Mersey Docks and Harbour Board), were elected vice-presidents; and Messrs. William Oulton, J.P. (the Right Hon. the Lord Mayor), and Charles W. Jones, J.P., were elected members of the council. A number of letters from visitors to the recent trials, and also from the competing firms, were read, all of which expressed complete satisfaction with the arrangements and results. Letters of regret for non-attendance at the trials from Lord Derby, president of the association, and his lordship's letter enclosing fifty guineas towards the expenses of the competition, were also read.

It was decided to hold a further series of trials about the beginning of October, 1900, by which time the existing legislative restrictions will probably be considerably relaxed. In this connection it was resolved to request the local Members of Parliament to take steps to secure the introduction of a short Bill to enact the increase of the tare limit from three tons to four, as the effect at present is to increase prime cost very greatly, owing to the use of aluminium or other expensive metals, or to tempt manufacturers to cut down bearing surfaces and factors of safety in construction. This matter was strongly commented upon in the report of the judges for last year's trials, and is still a great drawback to progress in heavy automobilism.

The marked improvement in the vehicles presented this year as compared with those which took part in the 1898 trials appeared to be a subject of general concurrence, the opinion being freely expressed that a highly favourable report will be published about November. It was stated that as a result of the trials a large number of orders had been given

THE HILL-CLIMBING CONTEST AT LIVERPOOL—SNAPSHOT EN ROUTE.

to the manufacturers who competed this year. The Lancashire and Yorkshire Railway Company, who had quite a contingent of representatives at the trials, had taken delivery of Messrs. Thornycroft's vehicle No. 2 (trailer), which carried 6½ tons during the trials and was awarded a gold medal. It is stated that sufficient orders were given to this firm to keep them busy for close upon twelve months.

THE HILL-CLIMBING CONTEST AT LIVERPOOL—SNAPSHOT EN ROUTE.

The Lancashire Steam Motor Company, Leyland, and Bayleys, Limited, London, had also, it was announced, booked a number of orders, chiefly from East Lancashire mill-owners. It was resolved to support the trials of motor-vehicles which are to be organized in connection with the Congress of the Royal Institute of Public Health at Blackpool next month, the arrangements being left in the hands of the honorary secretary, Mr. E. Shrapnell Smith.

AN electric vehicle manufacturing firm in Toronto, Ont., has copied the English example, and has constructed a motor-driven invalid's chair. It is equipped with three storage battery cells weighing 33 lb., and a small motor capable of driving it at a maximum speed of four and a half miles per hour.

## CHARGE DISMISSED.

### HON. C. S. ROLLS IN THE POLICE-COURT.

ON Tuesday last the Hon. C. S. Rolls and Mr. Ernest Hutton, J.P., both members of the Automobile Club, appeared before Mr. Rose, at the West London Police-court, charged with having "on July 26th unlawfully driven in Palace Gate, Kensington, light locomotives—to wit, motor-carriages—at a speed greater than is reasonable and proper, having regard to the traffic on the highway there."

Mr. T. W. Staplee Firth, a member of the Automobile Club, who has already won two automobile cases for members of the Club, appeared for the defendants.

William Beck (Police-Constable 126 F) swore that he was on patrol duty in Palace Gate at the time the two motor-carriages came along; that they were going at a rapid speed; that he held up his hand; that he thought the defendants did not see him do so, and that the carriages stopped farther on in Kensington Gate; that he went after them, and demanded the names and addresses of the drivers.

In reply to the magistrate the police-constable stated that the motor-vehicles were travelling at the rate of fourteen miles per hour; that there was not much vehicular traffic in Palace Gate, but that there were a number of people on the footpath going to and coming from Kensington Gardens. In cross-examination by Mr. Firth he stated that at the time the cars passed him he was standing at a point fifty yards from the turning at which Palace Gate joins the Kensington High Road; that he did not see the cars turn out of the Kensington High Road into Palace Gate; that he had formerly been a carman and that his age was twenty-two. He admitted that he did not know by what motive power the cars were propelled, but that they were proceeding at the rate of about fourteen miles an hour when they passed him. He did not notice any carriages in Palace Gate at the time, nor the presence of a single man, woman, or child on the roadway at the time. He saw Mr. Rolls, who was in the leading carriage, put up his hand. He followed the cars and found them stationary at No. 27 Kensington Gate, W., which was just round the corner. He (the police-constable) had stated that he had "lost" a motor-car the day before, which was being furiously driven in Palace Gate—he had "lost" the car because he could not catch it up. He had no method in judging the speed of a motor car.

Mr. Firth: In fact, you rely upon your imagination?

Police-Constable; Yes.

The Magistrate: Were the cars going faster than the ordinary traffic?

Police-Constable: Yes.

Professor Vernon Boys was then called by Mr. Firth, and stated that he was a Fellow of the Royal Society, late Assistant Professor of Physics at the Science and Art Department, one of the Gas Referees to the Board of Trade, and one of the judges at the recent Automobile Club Show. He knew Palace Gate well, having cycled through it almost daily for some years. One of the cars in question, that driven by Mr. Rolls, was an electric car which could not be driven at a high speed; it had amazing brake power. He had been with Mr. Rolls in the car on the road in question, and had ascertained that the car could be stopped without trouble whilst at its best speed in a space of three or four yards. The steering of the car was absolutely under control, and the control of the car itself was far better than that of a horse-drawn vehicle.

Mr. R. E. B. Crompton said he was an electrical engineer, Past President of the Institute of Electrical Engineers, and a member of the Institute of Mechanical Engineers, and was for nine years in charge of steam traction on highways in India; during five of those years he had been in charge of motor-vehicles running on the Grand Trunk roads of India. It was a part of his business to test speeds. He understood the construction of the car driven by Mr. Rolls, and he found it was so constructed that if a certain speed was exceeded a

retarding action would set in. He had tested the car in Palace Gates, and on a series of runs, during which the car was started at the corner at the rate of four miles an hour and then as soon as possible put on its highest speed. He concluded that at the end of about sixty yards the car could not travel at a speed exceeding nine and a half miles an hour. Mr. Crompton also spoke of the brake tests, which had proved eminently satisfactory. He pointed out also that there were no side turnings from Palace Gate.

Mr. Ernest Hutton, J.P., one of the defendants, stated that he was an electrical engineer. Mr. Rolls was driving a Columbia electric car, and he himself was driving his own 6-h.p. Panhard car. In coming along the Kensington High Road they found portions of the road taken up, with a mixed traffic proceeding in single file, and at this time the cars were not exceeding a pace of about three and a half to four miles an hour. A police officer told them to get along faster. On arriving at the corner of Palace Gate they went round the refuge. While in the Kensington Road their speed did not exceed four miles an hour, and in Palace Gate it did not exceed six and a half or seven miles an hour. Palace Gate was quite clear of vehicular traffic, and there was not a person on the roadway. They called at the house of a friend of Mr. Rolls, 27 Kensington Gate, and whilst there the police-constable came there and demanded their names and addresses. He charged them with furiously driving, and seemed very sceptical as to the correctness of the names and addresses given him by them; his demand was accompanied by rudeness, which they did not expect in a London police-constable.

The Hon. C. S. Rolls stated that he was a member of the Automobile Club of Great Britain and a member of the Automobile Club de France. He had passed the test and held the certificate granted by the French Government entitling him to drive in France. He had driven motor-cars since the Act came into force in November, 1896; had had nine motor-carriages; had never had an accident except a broken axle; and had never caused injury to any man, woman, child, horse, or vehicle. The car he was driving at the time in question was one owned by Mr. Alfred Harmsworth, who had asked him to try it, as he (Mr. Harmsworth) had just received it from abroad and could not make it proceed at a greater speed than about five miles an hour. It was an electric car, and specially built for town traffic; it was incapable of running at a high speed. In the Kensington Road there was a brewer's dray in front of him, and he was not able to drive then at a greater speed than about three and a half miles an hour. In Palace Gate, where there was no traffic at the point—about fifty yards from the corner—where the police-constable was standing, he was not running the car at more than about seven miles an hour. When about to turn the corner at the end of Palace Gates he held up his hand as a signal to any vehicle which might be behind him that he was about to turn the corner and stop.

In reply to the Magistrate, Mr. Rolls stated that the highest speed at which he travelled at any time during the afternoon in question did not exceed nine miles an hour, and that the tests of the vehicle which he had since made showed that the car could not travel at a high speed.

The Magistrate, in summing up the evidence, stated that it was clear that there was, at the time in question, traffic in Palace Gate; that the police-constable sincerely believed that the cars were travelling at fourteen miles an hour; but he (the Magistrate) admitted that it was difficult to judge the speed of a motor-vehicle (accustomed as one is usually to the sight of a horse in front of a vehicle), and that unless the pace of a motor vehicle was measured no accurate judgment could be arrived at. He thought that the police-constable was mistaken, and that the cars were not going at the rate of fourteen miles an hour. It remained for him to consider whether they were travelling at a pace which was dangerous to the public. He thought that the defendants having previously been urged by a police-constable in the Kennington Road to get along faster the defendants might be inclined to get along faster; but in

view of the fact that they were about to pay a visit in Kensington Gate, and that they knew they had a turning to take at a corner at the end, he did not think that they would be driving at a high speed. Taking into consideration the technical evidence, he did not consider their speed could have been more than nine miles an hour, although this pace might have seemed faster to the police-constable; and, seeing that there was no traffic then in Palace Gate, he did not consider that they were driving to the danger of the public. He therefore dismissed the case.

Mr. Firth asked for costs, as the defendants had succeeded in establishing their case; but the Bench declined to allow these.

## THE RIKER ELECTRIC DEMI-COACH.

THE Riker Electric Vehicle Co., of Brooklyn, New York, have sent us a photo, which we reproduce herewith, of a new electrical demi-coach they have lately introduced. The vehicle has seating accommodation for four persons, in addition to the driver and an attendant. Two electro-motors, of 2 kilowatt capacity each, are provided, they being geared to the rear wheels. The accumulators have a capacity of a run of 25 miles on level roads. The controller switch is arranged to give three forward speeds and two backward motions, the maximum speed being ten

THE RIKER ELECTRIC DEMI-COACH.

miles per hour. The vehicle, which is handsomely finished, is provided with wood wheels with solid rubber tires; its weight complete is given as about 1 ton 17½ cwt. As will be seen the driver has been placed, as in a hansom, at the back of the vehicle, leaving the view of the passengers entirely unobstructed. Furthermore it is pointed out that in a hansom nothing but the dashboard intervenes as a protection to the passenger. In this Riker demi-coach a large part of the battery is put in the box in front, serving as a very solid bulwark and putting a greater distance between the passenger and any vehicle or person that might chance to collide.

WITH regard to the run which is being organized by the Automobile Club to Folkestone and Dover next month, the arrangements so far made are as follows:—On Saturday, September 16th, there will be a run to Folkestone; on the following day, Sunday, members will cross over to Boulogne, and witness the finish of the Paris-Boulogne race, returning to Folkestone the same day; on Monday, September 18th, there will be a tour from Folkestone through some part of Kent; while on Tuesday members will proceed to Dover for the opening of the motor-car show which is being promoted by the Mayor of that city.

## SCOTTISH NOTES.

### A Carriage Accident.

THE following paragraph from the *Glasgow Herald* of Monday last is of interest from the fact that it was placed under the headline of "A Carriage Accident" in place of "A Motor-Car Accident," a title which from the presence of a motor-carriage many newspaper correspondents would have felt justified in applying to it. The motor-car party referred to was in charge of Mr. J. D. Brimlow, secretary of Stirling's Motor-Carriages, Ltd., of Hamilton, and had been for the past two weeks on tour in the Highlands. On inquiry on Wednesday I was pleased to learn that the injured gentleman, Dr. Edwards, of Glasgow, was rapidly recovering from the effects of the regrettable accident.

On Saturday afternoon, as Miss Hay, Kinloch House, accompanied by a lady friend, was driving in a phaeton on the public road a short distance above Kinloch, a motor-car going in the same direction overtook them at a sharp turn of the road in the wood, where neither party could see the other until close up. The spirited horse driven by Miss Hay became very nervous, and reared and plunged in a dangerous manner. One of the gentlemen in the motor-car came promptly to help Miss Hay, but when trying to control the frightened animal it again reared, and fell upon him. When extricated it was found that the gentleman had received a very severe scalp wound, and was bleeding profusely. The horse was also much cut about the legs. The gentleman who had been hurt was at once conveyed to Kinloch, and every attention was given him until the arrival of Dr. Taylor from Dunkeld, and he had the wound properly dressed.

### The Motor-Car and the Life-Boat.

IN several places in the North on Saturday last demonstrations in aid of the National Life-boat Institution took place. At Girvan in Ayrshire the demonstration was most up to date in having the presence of a motor-car and motor-tricycle, which are as yet novelties in that district. The cars, which belonged to Mr. John Stirling, who is at present residing in Girvan, led the long procession of cycles, etc.

### The Trossachs.

THE invasion of the charming little village of Aberfoyle, the starting point of the Trossachs, the other week by the motor-car was the occasion of considerable excitement among the inhabitants. The horseless wonder was literally "gaped at" with open-mouthed astonishment by old and young alike, the smart manœuvres of the driver also coming in for a fair share of admiration. A motor tour through the Highlands of Scotland in the present fine weather and at this season is particularly delightful, and it is surprising the incredible amount of ground which can, without the sense of hurry, be covered. The roads here are delightfully undulating in a great many places, and a very fair speed can be averaged in some of those beautifully secluded highways and byeways "far from the madding crowd."

### A Good Example.

ALL drivers of horses are not prejudiced against motor-cars. When driving recently in an automobile from Lanark to Carlisle I passed a wagonette and pair of fine bays which showed evident signs of terror and an inclination to bolt on our slowly passing them on the first speed going up a stiff hill. It must be confessed our first speed was a little noisy, and I was not surprised that the animals were alarmed. However, the driver kept his horses well in hand, and after walking alongside us for a while whipped them up and passed us. He turned after going a short distance and made his team meet us face to face this time and pass. After going a little further he turned again and once more overtook us, repeating these manœuvres over and over again

until his horses discovered that we had no intention of harming them, and finally paid not the slightest attention to us. If the sensible action of this driver were followed by others we should hear less about those alarming "motor-car accidents."

#### The Scottish Police.

THE petty spitefulness (one might almost call it) shown by the English police towards autocarists, and the shamefully one-sided treatment they receive from a certain section of the Bench in that enlightened country when up for an alleged but often undefined charge of lawbreaking, is, happily, practically unknown in this part of the country. Whether it is that the Scottish police are more intelligent or more tolerant than their brethren of the South or that Scottish autocarists are more law-abiding is a moot point, but the fact remains that charges of furious driving, failing to stop when signalled to, and all the other "heinous crimes" which "chauffeurs" are supposed to be addicted to, are practically non-existent here.

"BROWN HEATHER."

### THE GREFFE FRICTION CLUTCH.

ALTHOUGH the use of friction clutches in engineering work is by no means a new departure, yet the revival of the horseless-carriage movement would appear, judging from the large number of new devices which have lately come under our notice, to have given an impetus to the devising of new forms of clutches. Among these we may mention that which has been lately brought out by M. E. P. Greffe, of 34 Rue Philippe-de-Girard, Paris, of which we are herewith enabled to publish a brief description and several illustrations, Figs. 1, 2 and 3. The illustrations show the clutch arranged in such a way on the crank shaft of a motor-car as to control by a single lever the putting in and out of gear of two variable speeds, and to disconnect entirely the motor from the power-transmitting mechanism. Referring to Fig. 3, it will be seen that the motor-shaft *C* has keyed on it a disc or pulley *B*, to the periphery of which are attached four shoes *D*. The shoes project beyond the pulley *B* on both sides,

FIG. 1.—END VIEW OF GREFFE FRICTION CLUTCH.

and are so pivotally mounted on it that one side or the other may, under pressure, be moved slightly downwards, the opposite end, of course, rising a corresponding distance. At each side of the disc *B* are two pulleys *A A'*, running loosely on the shaft *C*; the faces of these pulleys, which are directly under the projecting portions of the brake shoes *D*, are covered with leather. It will be noticed that the outer faces of each of the shoes *D* are provided with longitudinal ridges or projections, the upper surfaces of which form two inclined planes. Fixed round the disc *B* and shoes *D* is a thin steel ring *E*, which is free to slide the whole width of the shoes *D* under the action of the levers *F*, which terminate in a pair of forks, between which, but not in contact with the same, is the ring *E*. When this ring is placed in a central position, the disc *B*, the shoes *D*, and the ring will all rotate without transmitting any power to the pulleys *A A'*. By

forcing the lever *F* over to the left the ring *E* is also carried in the same direction, and, meeting the inclined planes of the balanced shoes *D*, the latter are pressed down into contact with the face of the pulley *A*. Similarly, if it is

FIG. 2.—ELEVATION OF GREFFE FRICTION CLUTCH.

desired to make connection between the shaft *C* and the pulley *A'*, the ring is, by means of the lever, forced over to the right, the right-hand end of the shoes *D* then being brought into frictional contact with the pulley *A'*. Rigidly connected with the pulleys *A A'* are two spur wheels *G G'* of different diameters, which transmit the power at their respec-

FIG. 3.—SECTION OF GREFFE FRICTION CLUTCH.

tive speeds to corresponding spur wheels on an intermediary shaft. M. Greffe, who informs us that very little pressure is required on the lever *F* to alter the position of the ring, has sent us a diagrammatic circular showing his clutch arranged for use on De Dion motor-tricycles, Bollée voiturettes, and for both belt and spur-wheel driven motor-carriages.

A NEW firm has just been formed at Nancy (Faubourg Saint Georges), France, under the style of Thomas & Co., to deal in motor-cars and motor-tricycles.

WE learn that Mr. E. S. Morley, cycle agent, Diss, Norfolk, is now carrying a stock of motor-car spirit, and is thus enabled to supply the wants of automobilists passing through that district.

THE concern known as La Marque Georges Richard, 13 Rue Theophile-Gauthier, Paris, builders of the Richard motor-cars, is being reorganised, a company having been registered with the title La Société des Etablissements Georges Richard, with a capital of £320,000.

## A LONG DISTANCE RUN BY A STEAM LORRY.

JUST on the point of going to press we have received from the Clarkson & Capel Steam Car Syndicate, Ltd., of Devereil Street, London, S.E., the following interesting account of the journey of their vehicle from Liverpool to London last week:—"The car started from Liverpool by road with a load of three tons on Tuesday afternoon, August 8th. The first day's run was forty-nine miles, *via* Widnes, Warrington, and Sandbach. The second day's run, thirty-one miles, was to Cannoch. On the third day the car passed through Birmingham. There was a congestion of traffic in the vicinity of the Bull Ring, which we are told is a notoriously dangerous turning: the descent is steep and the road surface also slopes inwards towards the curb. At the worst part of the road the driver was requested to stop by an inspector of police for the purpose of traffic regulation, and after an interval was directed to proceed. On releasing the brakes the car moved quickly, so the driver put the brakes on again, and although the wheels were locked and the motion somewhat arrested, the car continued to move both forward and sideways towards the curb; scotches were used but were dragged along, and the car continued to slowly and deliberately glide by the irresistible force of gravity along the smooth setts. When the curb was reached the front wheels slowly mounted and then advanced across the pavement to the plate glass window of a cycle shop. When the car touched the glass it did not break for a perceptible time, and the driver says he could see the glass bend before it finally gave way; then the car stopped and the inspector at once told the driver to remove his hands from the levers in order that he might be satisfied that the brakes were properly applied. This he did, and the police, who were most helpful and even courteous, were convinced that, as one of them said, 'No mortal man could have averted the accident under the circumstances.'

"We give you particulars of the accident because reports have got into the daily papers that the brakes failed to act. This was not the case, and we hope you will assist us in contradicting the statement. Some little damage was done to the car but not sufficient to prevent it proceeding at once. The driver's nerve was rather upset by the accident, so he decided to put up for the night at Mereden, about six miles further on; the day's run being twenty-nine miles.

"After receiving a telegram Mr. Clarkson went down the following day (Friday) and drove the car all Friday night, getting to Fenny Stratford (fifty-one miles) at 8.45 a.m. on Saturday. Here they rested and took in oil. They had experienced much trouble at several places in obtaining water by reason of the drought, getting a few pailfuls at one place and a few at another. This trouble would have been aggravated but for the excellent working of the Clarkson condenser with which the car is fitted, and it may interest your readers to know that less water was used on our car than any other in the recent Liverpool trials.

"After leaving Fenny Stratford we discovered that the damage done to the burner at Birmingham was causing trouble; the protective fire-clay covering on top of the burner had been broken away and, in consequence, the burner-top was exposed directly to the heat and began to perish. However, we tried to get on, and it was not until we arrived at St. Albans that we found the burner-top must be renewed before we could proceed. Accordingly, we put the car up at 'The George' and returned to town by rail. On Monday a man went down with a new top, and as soon as Mr. Clarkson's other engagements permitted he went and drove the car back to town, the final run of twenty-one miles being accomplished in 5½ hours, without incident of any kind.

"The load was delivered in good condition to Messrs. Anderson, Tulloch & Co., who are greatly interested in the run. We are informed by Mr. Shrapnell Smith that this is the longest heavy load run that has ever been made, and it

is gratifying to us to be able to report that the car, which is the first heavy vehicle we have constructed, has stood the journey well. The wheels, which, as is well known, are subject to severe stress, have not given the slightest trouble, the same being true of driving chains and axle bearings. The automatic water-feed to the boiler worked perfectly the whole time; there is a little perceptible wear on the engine brasses, as might naturally be expected, but with the single exception of the renewal of the burner-top, owing to the Birmingham accident, the vehicle completed the trip without a breakdown of any kind."

MESSRS. MAROT, GORDON & Co., 37 Rue Brunel, Paris, motor-car builders, etc., have just increased their capital from £4,400 to £16,000.

ONE of the Dunlop motor-tandems was shipped to Australia last week for use on the Sydney and Melbourne tracks during the coming Australian cycling season.

THE following was copied from the notice-board at the Automobile Club yesterday:—"A companion desired in February next, to travel from Hong Kong to Paris and London; one used to photography preferred."

WE regret to learn that the Automobile Club have unfortunately been obliged to give up for the present season their proposed tour in Scotland. The cause is that it has been found to be too late to secure accommodation at the hotels. It is hoped, however, that the tour will take place next year.

A WRITER in the *Leicester Post* referring to Mr. W. Turner's recent letter, commented upon in our columns last week, considers the thanks of the public are due to him for getting rid of his pony. "The public at large," he adds, "will now be safe from that particularly unmanageable hay-motor." The question is, however, Where is the pony now?

LORD ALWYNE COMPTON, M.P., went to the recent *fête* at Biggleswade from Earl Cowper's residence at Wrest Park, Silsoe, on Mr. Dan Albone's motor-car. Mr. Albone took him back to Silsoe on his car in the evening. Will Lord Compton have to be added to the Parliamentary-Automobile Party?

AMONGST those recently elected to membership of the Automobile Club are the following:—The Marquis of Anglesey, Sir John Carden, Bart., Dr. Allingham, Messrs. Charles Jarrott, Fred Ballard, J. Ernest Hutton, J.P., A. H. Barkworth, F. D. Lyon, E. Fitch Shepard, Henry Mann, John Garroway, Henry Jephson, and Charles Connah.

THE Melbourne Carriage, Motor and Cycle Co., Limited, has been registered, with a capital of £3,000 in £1 shares, to acquire the business carried on at Dudley Road, Wolverhampton, by Frederick W. Summerfield and Herbert A. Beech, and to carry on the business of cab, carriage, motor, and cycle builders, etc.

THE Dobrashian Motor Syndicate, Limited, has been registered with a capital of £2,000 to adopt an agreement with G. S. Dobrashian, to acquire and turn to account any patents and rights, and to manufacture and deal in the articles to which such patents, etc., relate. Registered office, 5, Copthall Buildings, E.C.

THE Committee of the Health Exhibition to be held in Blackpool in September and October next, in connection with the Congress of the Royal Institute of Public Health, have decided to include a display of motor-cars. The Committee of the Automobile Club and the Committee of its Liverpool Branch, the Liverpool Self-Propelled Traffic Association, have promised to assist in every possible way in forming a good automobile section. Before determining whether any trials of motor-vehicles shall take place, the Committee are desirous of knowing how many exhibitors there are likely to be in the section, and the number and nature of the exhibits.

## A CARBONIC ACID MOTOR-CAR.

FOR nearly three years Mr. C. D. P. Gibson, a well-known chemist and mechanical engineer of Jersey City, N.J., has given his attention to the construction of a motor-car propelled by means of carbonic acid, a gas of wonderful expansive power, but beset with difficulties in its practical application to vehicles. Thousands of dollars have been spent in futile attempts to control it, its tendency to freeze in the valves being an insurmountable obstacle to previous inventors in this line.

The vehicle which Mr. Gibson has chosen to first exemplify his system is a stanhope with the usual tubular truss frame and tangent spoke wheels, the front 36 in. and the rear 38 in. in diameter. The customary compensating gear regulates the rear wheels, its location being in the same plane as the driving sprocket. Provision is made for an extra seat if desired. While the general design of the carriage is attractive and all the visible details finished in a thoroughly mechanical manner, interest, states the *Horseless Age*, centres chiefly in the ingenious mechanism concealed in the body of the vehicle, where is located an engine weighing only 32 lb., yet capable of developing 12 h.p.—the lightest engine for its power so far known.

The carbonic acid is stored in commercial cylinders, tested to 6,000 lb. pressure, and each having a capacity of 10 to 12 lb. of acid. They are about 4 ft. in length and 5 in. in diameter. Eight of these are carried in a carriage, four on each side, constituting what Mr. Gibson calls a "battery," the two batteries containing enough acid for a run of eight miles on country roads. The reason for the arrangement in two batteries is to prevent the operator from exceeding the radius of action of the vehicle. When one battery is exhausted it is a sign to return to one's destination, and inasmuch as the second battery contains the same amount of acid as the first, a safe return is assured. This present method of storage, however, is merely the best available at present, and when vehicles are manufactured in quantities it will be superseded by an improved method which Mr. Gibson says will allow a run of thirty miles on one charge.

The acid is conducted through the ordinary commercial valve and a small pipe to the very heart of this system, the Gibson valve, in the engines and the cycle, controlling the flow of the acid under all circumstances, which prevents freezing and is easily manipulated. Particulars of this achievement Mr. Gibson is not prepared to give for the reason above stated, patents having been applied for in all foreign countries.

In the rear of the body are two valves, each controlling a battery, one only being opened at a time. To make due allowance for expansion the cylinders are filled only half full of gas, the rest of the space being left for the air cushion, which serves the same purpose as a dome in a steam boiler.

The ordinary working pressure of the acid is between 2,500 and 2,700 lb., maintained by a gasoline burner under the expander, the flame of which is closely regulated by a diaphragm. If the acid should reach a temperature giving 3,000 lb. pressure the diaphragm automatically moderates the flame and immediately brings the pressure down to the normal. Any higher pressure than 3,000 lb., could not be practically employed, because the wear and tear on the apparatus would destroy the economy. A gallon of gasoline will supply this burner for a week. The engine which handles this great force is surprisingly small and delicate in appearance, although it is in reality as strong and durable as science can make it of such weight and for such duty. It is of the horizontal, reciprocating type and has two cylinders, 1 $\frac{3}{4}$  in. in diameter with 4 in. stroke. A noticeable feature is the absence of noise, the little 5-16 pistons and the valves performing their functions almost as silently as clockwork. At 500 revolutions and 500 lb. pressure the engine develops twelve horse-power, which is sufficient to handle a heavy truck on city

streets. All parts are made of hardened, ground and tempered steel, and are encased from dust. Power is transmitted direct to the rear axle from a nine tooth sprocket wheel of 1 $\frac{1}{2}$  in. pitch on the engine shaft to a thirty-nine tooth sprocket on the rear axle.

One lever performs all the operations of controlling the vehicle with the exception of the band brake on the rear axle, which is brought into play by a pedal, but is seldom used because the engines when shut off automatically brake the carriage. In the manipulation of this lever a right and left motion steers, a rocking motion controls the power, and by raising the handle the engine is reversed and energized by the same rocking motion.

There are no gauges to watch and burden the operator with anxiety. The controlling mechanism is kept free from vibration by means of compensating devices in the frame and in the controlling mechanism itself, so that whatever the relative positions of the wheels the lever is always safe in the hand.

A unique feature of this system is the immense reserve power that is available for bad roads, for hills and emergencies of any kind. In the course of an experimental trip deep sand was traversed with ease, and as conclusive evidence of the power of the engine the vehicle was very slowly run into a barn over an abrupt rise of six inches with the passengers in it, and without any momentum such as is generally required to surmount such an obstacle. Carbonic acid has hitherto been so costly to produce as to make its economical use for power purposes out of the question, but it is now stated that the cost of production has been lowered to 12s. 6d. per ton, rendering it available for this purpose, and a strong syndicate is being organised in New York to develop the Gibson system for road vehicles and street cars.

## EXCESSIVE SPEED OF MOTOR-CARS.

At the Liverpool Police-Court on Tuesday, Maurice Souvestrie was summoned under the Locomotive and Highways Act, 1896, for having on the 5th instant driven a motor-car down Hardman Street at a speed greater than was reasonable and proper having regard to traffic in the street. It was given in evidence that the car was driven at the rate of at least eighteen miles an hour. A fine of 40s. and costs was imposed. The same defendant, whose name appeared on the information as Maurice Gildart, was summoned for having on the 3rd inst. in Greenbank Road driven a motor-car so as to endanger life or limb. In this instance a police-officer said that the speed was from fourteen to fifteen miles per hour, while the driver of a wagonette, who said he would have been run into but for the fact that his horses were walking, estimated the speed at twenty miles per hour. The Bench inflicted a fine of 40s. and costs. Mr. Cripps supported the informations, and defendant was represented by Mr. Watkins, who urged that the defendant ought at the time to have been told that he would be summoned, so that he might have an opportunity of procuring witnesses as to the speed at which the car was being driven.

THE *Calcutta Englishman*, in its last issue to hand, states that the motor-car for the conveyance of mails to the railway station in Colombo, Ceylon, is to arrive shortly, and according to Mr. Pennycuik's report it is to be a Leyland steam car, having a carrying capacity of one ton.

A COMPANY, composed of Chicago and Mexican capitalists, is being formed for the purpose of establishing an automobile service in the City of Mexico. It is understood that an effort will be made by the company to obtain an exclusive concession for the operation of automobiles in that city for a long term of years from the Mexican Government, but it is doubtful if such a privilege will be granted.

At the last meeting of the Buckingham County Council, Councillor H. J. Johnstone called attention to the rate of speed at which motor-cars are at present travelling and the danger to the public as well as the inconvenience to other traffic arising therefrom, and moved, "That in the opinion of this Council the Local Government Board should take measures to secure the registration of motor-cars and their drivers." A long discussion ensued, and in the end the resolution was carried.

## DRIVING A MOTOR-CAR FURIOUSLY.

At Newport, Isle of Wight, the other day, Mr. William Player Bugslocke, of Ryde, was summoned for driving a motor-car furiously through Haylands into Ryde on July 24th. Evidence was given that the defendant was driving at the rate of from eighteen to twenty miles an hour. Numerous complaints were stated to have been received, and one witness said the pace was enough to paralyse children. The Chairman (Lieutenant-General the Hon. G. J. L. Calthorpe) said the Bench had no doubt defendant was driving a great deal faster than he was allowed to do by the Act, and as he was fined £5 in February for a similar offence he would now have to pay a fine of £7 and £1 os. 6d. costs.

## THE LONDON STEAM OMNIBUS COMPANY.

An extraordinary general meeting of the shareholders of the London Steam Omnibus Company, Limited, was held on Thursday last week at the Hotel Cecil, London, W.C., for the purpose of considering and, if approved, of passing resolutions changing the name of the company and altering the articles of association; and also to receive a statement by the directors as to the arrangements made with the vendors for the reduction of the purchase consideration payable to them, and for varying the terms of the licence granted to the Company on August 5th, 1898, such arrangements being part of the plan agreed upon for the settlement of actions commenced against the vendors and others by certain shareholders.

Mr. E. H. Bayley (Chairman of the Company), who presided, said: As explained in the circular that was sent round, this meeting has been called, in the first place, to arrange for the general meetings of shareholders to be held twice a year, instead of only once. We arranged some months ago to call you together to pass the necessary alteration in the articles of association; but the shareholders' actions were commenced, and it was considered advisable to postpone the matter until the litigation was settled. Now that the actions are settled, this meeting has been called, and I shall presently put the proposal to the vote. You are aware of the valuable concessions that have been obtained from the British Motor Company, the vendors of the patent rights. The broad general result is that you are now £20,000 in cash and £140,000 in shares better off than you were six months ago. It is right, as you know, that the negotiations which have produced the satisfactory improvement date back from before the registration of the company. The terms originally asked by the vendors were much more onerous than those ultimately published in the prospectus. Among other conditions demanded was one that this company must purchase all its omnibuses from the vendors, and you will easily understand that this would doubtless have meant paying an excessive price for an inferior article. Another condition was that the vendors' shares, £140,000 in value, should not be deferred shares, but should rank equally with the cash shares. I should here explain that one, if not two, out of the five directors were nominees of the vendors, and, therefore, could not reasonably be expected to oppose their claims, which made it all the more difficult for what I may call the independent directors to fight your battle. Three of us, however—Messrs. Mace, Hall, and myself—were absolutely independent, and we got the two obnoxious conditions, to which I have referred, and others struck out. The prospectus was issued and the capital subscribed, and now that all disputed matters have been pleasantly settled I wish it to be placed on record that we directors have withdrawn nothing and modified nothing that we stated in the prospectus. If it had to be issued again, we should not alter a syllable. After the capital had been subscribed we still continued to press the vendors for concessions, and our efforts were attended with a considerable measure of success. The truth is that Mr. Lawson, who is the leading spirit of the British Motor Company, has a great stake in the success of the motor industry, and especially in this omnibus company. He owns over 200 patents in connection with motors, which will greatly increase in value if this company prospers, and which, on the other hand, will greatly depreciate in value if this company fails. Using this fact as a lever, we continued to press Mr. Lawson for a revision of the purchase price, and before I had the pleasure of making Mr. Hunter's acquaintance Mr. Lawson had given a pledge to me and also to Mr. Mace to give up the £140,000 of shares and some of the cash. When 250 shareholders applied to have their money back and commenced legal proceedings which could only end in throwing the company into liquidation, Mr. Lawson, rather than see the company wrecked, agreed to give up not only the shares, but £20,000 in cash. He has also granted a new licence on better terms than the old one. Mr. Hunter exercised a wise discretion, and took an enlightened view of his clients' interests, when he advised them to drop the actions and accept this compromise rather than throw away their money in law. The litigation has thus been satisfactorily closed. As far as the two gentlemen are concerned who represented the British Motor Company on the board, the agreement provides that Mr. Lawson shall procure their retirement, and I presume that their resignations have been received. As to the three independent or shareholders' directors, I intimated some months ago that, having been unanimously elected chairman of the Daimler Motor Company, I intended to devote my time to making that great undertaking a success, and should take a favourable opportunity of resigning my seat on the board of this company. Mr. Mace and Mr. Hall decided to follow the same course as soon as this litigation was ended and a new board could be arranged for. Although this litigation has stopped the progress of

the company for six months, and delayed the placing of omnibuses on the streets, I have much pleasure in stating that the organization of the company is in perfect working order, and there is no reason why you should not now go full steam ahead. Above all, we have worked out the omnibus itself, which when we started was only a success on paper, into a proved mechanical success. It has been tested practically by running over 1,000 miles on every description of road without a hitch, and at a cost which, under good management, will yield enormous profits as compared with those of the horse-drawn omnibus. We have concluded what both we and Mr. Hunter consider a very valuable contract for the building of eighty omnibuses, and my advice is not to lose a moment in getting them at work in the streets. It would be a good stroke of business to offer the builders, who are the Daimler Motor Company, some inducement to get a considerable number out in advance of the agreed time, so as to be ready for the spring traffic next year. Mr. Straker will have some minor improvements to suggest; but, in the meantime, the motors and the bulk of the machinery should be pressed on with, or you will lose the time when they ought to be at work coining money. It is my firm conviction that, with good management, you ought at this time next year to be receiving a dividend of at least 10 per cent., and that your shares will then be at a high premium. I now beg to move the first resolution, which reads as follows: "That the name of the company be changed to the Motor Traction Company, Limited."

Mr. J. G. Hall (director) seconded the resolution, which was unanimously agreed to.

The Chairman: I have now to propose: "That Article 46 shall be altered by substituting for the word 'once' the word 'twice,' so that the latter part of the article shall read: 'A general meeting shall be held twice in every year (after the company is incorporated), on such day and at such place as may be determined upon by the board.'"

Mr. J. H. Mace (director) seconded, and the resolution was carried unanimously.

Both resolutions were passed without discussion.

On the motion of Colonel Harris a vote of thanks was accorded to the chairman and directors, and, the Chairman having suitably acknowledged the compliment, the proceedings terminated.—*Financial News*.

## MOTOR-CAR TOURS THROUGH THE MIDLANDS.

The Motor Touring Company, during the last holiday week, commenced a series of motor-tours through the most picturesque and historic places of interest in the Midland shires, commencing on Bank Holiday with a run to the old Cathedral City of Lichfield. The car started from Stechford Station, near Birmingham, at 2.30 p.m., the rain in the morning having prevented the advertised run to Stratford-on-Avon. A full equipment of passengers boarded the car, and immediately—under the able supervision of Mr. T. Morrison, manager of the Company—we started at a good pace on our journey, but on arrival at the noted Fox and Goose Inn a stalwart city police officer stopped our career, and informed our pilot that on account of the vehicular traffic occasioned by the Birmingham races being held the same day, the car would have to go a considerable distance out of its way to reach its final destination. Our guide at once obeyed the instructions given, and steered the car in the direction desired, which was along the main road as far as Church Lane, Aston, where we turned off and proceeded on our journey through Aston Manor via Gravelly Hill, Erdington, Wyde Green, and Sutton, reaching Lichfield about 4.15 p.m., after a most enjoyable run. Our return journey was made at 6.15 via Coleshill, Minworth, and Castle Bromwich, arriving home in good time, about 8 p.m., all expressing themselves well pleased with the pleasant outing.

On Tuesday, the 8th inst., we were again invited by the manager to take another and more extended whole-day run to the charming Vale of Evesham. The car started at 11 a.m., piloted again by the manager of the Company, Mr. T. Morrison. The holiday, together with short notice of run announced, no doubt prevented a full complement of passengers; nevertheless a dozen turned up, and our car was soon on its journey, which was a circuitous route by way of Stonebridge Hotel, where we arrived at 11.15 a.m., Kenilworth 12.30 p.m., Warwick 1.17 p.m., Stratford-on-Avon 2.10 p.m., Bidford 3.10 p.m., arriving at Evesham at 4.15 p.m., after an exceedingly stiff climb up the Bostock Hill. The scenery en route embraced the most picturesque and beautiful landscape of the two famed shires of Warwick and Worcester. On arrival at Evesham we put up at the well-known Rose and Crown Commercial and Family Hotel, where an excellent dinner was speedily served. Our party having regaled themselves with the good things provided, we broke up into groups and sauntered round the good old country town until the blow of the horn by our pilot warned us that the time of departure had arrived, and immediately the car was remounted for its return journey, not before, however, a large concourse of townfolk and villagers had assembled to inspect the latest invention in vehicular enterprise. They evidently thought we had taken the town by storm, judging by the look of wonderment expressed on their features and the enthusiastic send-off they gave us on our departure. Promptly at 6 p.m. we started on our return journey via Alcester 6.45 p.m., Grocott Hill 7.40 p.m. (one and a quarter miles long), Moseley 9.17 p.m., arriving at Stechford at 10.15 p.m.

The weather being beautifully fine, and the roads in splendid condition the whole way, the drive proved a very enjoyable outing, the car going in splendid condition and without a single hitch throughout the entire journey, covering a distance close upon 100 miles, a record performance, we believe, yet accomplished by a motor-waggonette of its size.

There can be no doubt that shortly these wagonettes will be commonly seen on the main roads of England. We understand, in fact, already negotiations are being entered into with several English and the best Continental firms to place on our main roads the latest improved form of motor-cars. Birmingham being in the centre of most beautiful landscape scenery, there should be a great opening for the motor-car, especially should it prove a boon to the working classes, to whom a cheap and rapid means of transit to the popular rural resorts must be of incalculable value.—*The Birmingham Telegram*.

### A MOTOR PATENT UPHELD.

IN the Court of Appeal last week before the Master of the Rolls, Sir Francis Jeune, and Lord Justice Romer, judgment was given in the case of the British Motor Syndicate, Limited, *v.* Andrews & Co., Limited. This was an appeal against a decision of Mr. Justice Kekewich. The plaintiffs, as the registered proprietors of letters patent (No. 5,479 of 1890) granted to Frederick William Lanchester for "improvements in gas motor engines," brought the action to restrain the defendants from infringing the patent. Lord Justice Romer, who read the judgment of the Court, said the defendant's engine was an improved Korting, but it was started according to Lanchester's invention, and therefore was an infringement. It followed that the plaintiffs were entitled to succeed on this appeal, and there must be an injunction restraining the defendants from further infringing the plaintiff's patent with an inquiry as to damages. Plaintiffs would have their costs, both of the appeal and of the Court below.

### SALES, WANTS, Etc.

[All Advertisements under this heading will be inserted at the minimum rate of 1s. 6d. for 18 words and thereafter at the rate of 1d. per word per insertion, but on no account will any Advertisement be inserted unless prepaid.]

**NIPPLES FOR MOTOR-CAR WHEELS.**—All gauges, lowest prices, prompt deliveries.—John Child Meredith, Hampton Street and Summer Lane, Birmingham.

**STEAM CAR FOR SALE.**—Powerful and simple; to carry four to six passengers; covered-in, solid rubber tires; £250.—W. H. Brown, Engineer, Devizes.

**TRICYCLE FOR SALE** at a low figure. Practically new and latest pattern; genuine De Dion throughout; with all accessories; can be seen in London.—Box 72, *Motor-Car Journal*, 39-40 Shoe Lane, London, E.C.

**WORKS FOR SALE.**—Modern plant. Promoters note: Purchase in cash or shares.—"Engineer," 58 Waterlow Road South, Wolverhampton.

**ELECTRICAL ENGINEER** seeks Situation. Thoroughly experienced in motor-cars.—Apply Box 83, *Motor-Car Journal*, 39-40 Shoe Lane, London, E.C.

**WANTED.**—Benz or Decauville Car; in good condition, and cheap.—Full particulars to Guest, Ockbrook, Derby.

**DAIMLER MOTOR-WAGONETTE**, 5½ h.p., grand carriage, in perfect condition, new tires, re-painted and upholstered, to carry four or six, free trials to buyers.—Apply Frank F. Wellington, 36 St. George's Square, Regent's Park, N.W.

**MOTOR-WAGONETTE** by Daimler, 5½ h.p., to carry eight passengers besides driver, geared low for hill climbing, suitable for seaside resort, in grand condition, almost new, free trials to buyers; price £275.—Apply Frank F. Wellington, 36 St. George's Square, Regent's Park, N.W.

**THREE MOTOR DELIVERY VANS.**—Could be made into wagonettes; in good condition; to be sold at ridiculously low price to make room for new carriages.—Can be seen at Frank F. Wellington's, 36 St. George's Square, Regent's Park, N.W.

**BENZ INTERNATIONAL SOCIABLE CARRIAGE**, to carry three, beautifully upholstered, very powerful, with all latest improvements; price £125.—Apply Frank F. Wellington, 36 St. George's Square, Regent's Park, N.W.

**GENUINE DE DION QUADRICYCLE**, interchangeable to Tricycle, very little used, exceptional bargain, in grand running order, price £65; De Dion Tricycle, 1½ h.p., fitted with front attachment if required, in grand order, price £45; De Dion Tricycle, 1½ h.p., really fine machine, good goer, price £35; De Dion Tricycle, 1 h.p., splendid running machine, price £30; Two Bollées in grand working order, to be sold cheap; also two Werner Bicycles, £20 each.—Apply Frank F. Wellington, 36 St. George's Square, Regent's Park, N.W.

**PANHARD MOTOR**, 6 h.p., all latest improvements, complete for running, with fly-wheel, burners, pressure tank, starting gear, governing gear and carburettor; first-class condition; price £55.—Napier, Vine Street, York Road, Lambeth, London.

### Trade Announcements.

[All Advertisements under this heading will be inserted at the minimum rate of 2s. 6d. for 30 words and thereafter at the rate of 1d. per word per insertion, but on no account will any Advertisement be inserted unless prepaid.]

**PLATINUM.**—Used Ignition Tubes Wanted, and Platinum Scrap of all kinds Purchased; best prices by Derby & Co., 44 Clerkenwell Road, London, E.C. Established 1797. 24

**MOTORS ON HIRE.**—Daimlers, Panhards, Benz, New Beestons, etc., in good order, by day, week, or month.—The Yorkshire Motor-Car Co., Ltd., Bradford.

**BENZ**  
GREASE CUPS,  
3/6

THE SOUTHERN MOTOR-CAR CO., 59 BRIXTON ROAD, LONDON, S.W.

### TO CORRESPONDENTS.

All communications intended for insertion in this Journal or relating to Editorial matters should be addressed to THE EDITORIAL DEPARTMENT, MOTOR-CAR JOURNAL, 39 and 40 Shoe Lane, London, E.C. Letters must in all cases be accompanied by the name and address of the writer, as no notice will be taken of anonymous communications.

The Editors cannot undertake to return MSS. or drawings, although every effort will be made to do so in the case of rejected communications. Where such are regarded as of value, correspondents are requested to retain copies.

The Editors do not hold themselves responsible for the opinions expressed by their correspondents, or for statements and facts which do not appear in the editorial columns.

The Editors and Publishers beg also to state that they will accept no responsibility for unsolicited contributions, even if used, unless payment for same is directly specified in forwarding, and the terms arranged before publication.

To insure insertion communications and contributions must be in the Editors' hands by Wednesday forenoon of the week in which the same are intended to appear. Disappointment may be caused by non-compliance with this rule, and to avoid this earlier receipt, if possible, is necessary.

## COMMENTS.

### The Automobile Club's Autumn Tour.

THE secretary of the Automobile Club has kindly furnished us with a copy of the programme of the forthcoming autumn tour. On Saturday, September 16th, there will be a run to Folkestone. The distance is 77½ miles, the route decided on being *via* Maidstone. On the following day, Sunday, members will cross over to Boulogne, and witness the finish of the Paris-Boulogne race, returning to Folkestone the same day; on Monday, September 18th, there will be a day tour from Folkestone to Canterbury, Minster, Sandwich, and back to Folkestone. On Tuesday, September 19th, members will proceed to Dover for the opening of the motor-car show which is being promoted by the Mayor of that city, returning to Folkestone the same evening. The return journey to London will be made on Wednesday, the 20th. As usual, arrangements are being made for the provision of seats in a club vehicle for members who do not own motor-vehicles. If the present fine weather should hold out, the tour should, like its predecessors, prove both interesting and enjoyable.

### An Example for Horse Owners.

THE note, "A Good Example," from our Scottish correspondent last week is worthy of more than passing notice, for it is rarely that one comes across the owner of a horse or horses who is determined to make his animals accustomed to automobiles. We know that in writing this note we shall draw upon us the ire of some of our contemporaries who devote themselves to horses, but we venture to suggest that a large proportion of the accidents ascribed to the motor-vehicle are due to the stupidity of drivers who habitually drive with loose reins, so that quick control of their horses is impossible. We believe that if a frightened horse is properly checked and pacified before he is terror-stricken and unmanageable, a runaway can very often be averted. But when the reins are hanging limp over the dashboard the horse gets the start and is soon beyond control. The driver of a horse is assuming a moral and legal responsibility when he brings an animal upon the highway, where all have equal rights with himself, and the time has arrived when this responsibility should be recognised, and drivers held accountable for the animals they guide. The drivers of motor-vehicles are, and will for some time at least be, under strict surveillance, and justice demands that drivers of horses be treated in the same manner.

### The Latest "Endurance" Car.

MESSRS. MULLINER, the well-known carriage builders of 28 Brook Street, Bond Street, W., who have established quite a reputation for carriage building work for motor-cars, have just completed the body of a new Endurance motor-car for Mr. J. Burns, of 44 Berners Street, W., and on Monday last we had an opportunity of inspecting the vehicle. It takes the form of a three-seated dog-cart, and is

generally of a most attractive design. The body is painted in black and light olive green, picked out in maroon and fine-lined yellow. The car is fitted with cycle-type wheels, shod with pneumatic tires, while the front of the vehicle is adapted to receive a large touring basket. The battery and induction coil in connection with the electrical ignition are carried in a box on the floor in front of the driver. The cushions are of the spring type, of which Mr. Burns is making a speciality, and from our brief trial appear to be very comfortable. Another feature of the car is that by simply removing four bolts the body can be instantly detached from the frame, carrying the motor and transmission gear. Altogether the vehicle is of taking appearance, and, in view of the finish Messrs. Mulliner have given to it, whoever becomes its owner will have a car of which they may justly be proud.

### Ladies and Motor-Tricycles.

HAPPENING again during the week to call on Messrs. Mulliner, the well-known carriage-builders of Brook Street, W., we were shown a convertible motor-quadracycle rejoicing in the name of "Wildfire," which the firm are at present engaged in re-enamelling. On enquiry we find that the machine, which is a Peugeot fitted with De Dion motor, has just been sold by the Motor-Car Co., of Shaftesbury Avenue, W.C., to Mrs. G. H. de Bathe (Mrs. Langtry) for the use of that lady and her husband.

### Carriage Builders and Motor-Cars.

THE *Carriage Builders' Journal* has published a special motor-car issue, devoted to a description of the vehicles shown at our recent Exhibition at the Agricultural Hall. In commenting on the subject of automobilism our contemporary remarks: "We cannot shirk the motor-car even if we are inclined to do so. It is with us, and we cannot get away from it. We may try to argue it away, but it will not budge, and all we have to do is to make the best of it. As Galileo said, '*E pur si muove*'—it moves, and we have to reckon with it. We may prefer the horse and the horse-drawn vehicle, but the world is taking to the motor-car, and as wise men we must recognise and adapt ourselves to the new condition of things. As we remarked last month, the motor-car has come and has come to stay, consequently carriage builders have no resource but to make up their minds to understand it and do their best with it."

### An "Accident" or a "Miracle."

"AT the very moment of writing" (another attack on motor-cars), says the editor of the *Stable and Kennel*, "we have to record a great commotion near our offices, in the Strand, caused by a motor delivery wagon suddenly dashing out of Wych Street into the midst of the traffic. It has startled all the horses in the neighbourhood, and it will be little short of a miracle if some awful accident does not happen." We have scanned the daily papers to learn whether the "awful accident" happened or whether the "miracle"

occurred. We have also examined two or three 'bus drivers whose vocation led them by the *Stable and Kennel* on that fateful morning, but, up to the time of writing, we have not been able to ascertain whether the awful accident predicted followed the startling of the horses or the miracle occurred after the great commotion. Anxious for information we shall be glad to hear what our friend whose offices are in the Strand has to report. Meanwhile he will be glad to know that the wood pavement of Shoe Lane in front of our *sanctum sanctorum* has materially lessened the clatter and noise produced by the horse-drawn vehicles that persist in passing from Holborn to Ludgate Circus.

#### Ladies and Motoring.

WITH reference to our comment last week on ladies and motoring the accompanying photograph will be regarded as conclusive evidence so far as Mrs. Bazalgette is concerned. The illustration shows the lady on her Benz Ideal, on which she travels many miles nearly every day. At first she had some little difficulty in turning the fly-wheel to start

MRS. BAZALGETTE ON HER BENZ IDEAL CAR.

the motor, but that she has overcome, and now drives herself in a very expert fashion. The car goes beautifully, and the other day she went from her home in Portman Square, W., to Southsea, leaving the former place at 9 a.m. and arriving at her destination at 5 p.m. Mrs. Kennard, the novelist, is also a lady motorist, who would probably be prepared to controvert the *Daily Telegraph's* assertion that the motor-car is not for the fair sex.

#### The Late Mr. Epstein.

WE regret to learn of the death at Broadstairs of Mr. L. Epstein, who was well known amongst electrical engineers as an inventor of an improved Planté storage accumulator. Mr. Epstein was an Austrian by birth, and received his technical education in Austria and in Germany. He was for several years director of one of Messrs. Siemens and Halske's branch works—that devoted to electrical accumulators. Here he evolved his battery, and, patenting it, he came to London to establish its claims for commercial use. He also devoted much attention to the design of motor-vehicles, his arrangement having not only accumulators, but the engines for charging them.

#### Lend a Hand!

ONE result of the accident to Mr. Rush's car on Monday last, referred to in other columns of the present issue, is that he has not a very good opinion of at least two fellow automobilists. After his car had overturned, and with his friend still underneath, two gentlemen went by in a motor-car, and, although signalled to for assistance, could not, as Mr. Rush puts it, "find it convenient to lend a hand." Our experience has so far been that automobilists are only too willing to render assistance to fellow motorists in distress, and we prefer to believe that the experience of Mr. Rush is the exception which proves the rule of the good feeling which prevails in the automobile world.

#### Omnibuses in London.

THE fact that the London General Omnibus Company can declare a dividend of 8 per cent. and secure to the shareholders a further bonus of 2½ per cent. will probably cause the directors to philosophise in the spirit of "let well alone." Besides, they have 16,000 horses, and to try experiments in the way of motor-traction on their own account would cost money. Add to this the fact that the chairman of the Company, Mr. John Pound, has had an unsatisfactory ride on a motor-'bus from Deal to St. Margaret's Bay, and the public may be certain that the L.G.O.C. is not likely to give much impetus to automobilism. It will not lead, but will not object to follow, and the directors "are carefully watching the question of mechanical traction." Meanwhile other people are doing what they can to develop mechanically-drawn 'buses, and some of these will shortly be seen in the streets of the Metropolis. At present we have seen the motor-car at its best as a fair weather car; but as the winter approaches attention will have to be given to the 'bus-like form suitable for winter work.

#### The Motor-Car for Strolling Players.

MANY times have we advocated the use of motor-vehicles and motor-tricycles in connection with the conveyance of goods and journeys of commercial travellers. The use of these cars should also extend in the theatrical profession, not only for the transport of the requirements of theatricals but also the conveyance of the players themselves. Not only would our actors and actresses thus become independent of the railway companies when on tour but they would also, at the end of each week's work, find the trip on their motor-vehicle have a reviving influence on their health and spirits. Already the idea is being developed in this direction by the Modern Marvel Co., Ltd. (Edinburgh), of which Mr. T. J. West is the general manager. This gentleman is about to commence an eight months tour with his cinematograph, travelling in a 5½-h.p. Daimler wagonette. Journeying from town to town, and conveying his own apparatus and staff, Mr. West will thus emulate the old strolling players and demonstrate the achievements of his motor-car in many towns and villages throughout Great Britain.

#### A Stand for Motor-Cycles.

THE Ailsa Craig Machine Co., of East Putney, S.W., are bringing out an improved stand for motor-tricycles. Many forms of stands are already in use to enable the rear wheels of a machine of this kind to be held off the ground so that the motor may be adjusted and experimentally run in the store shed, but the task of lifting the rear axle on to the supports has not been a light one. The new Ailsa Craig stand gets over the difficulty in a simple and effective way. It consists practically of two small lifting jacks combined with a support; the device is simply placed below the axle and operated in the usual way, the rear part

of the machine being lifted and held clear of the ground. We understand that the new stand has already met with the approval of several motor-cycle firms.

**Some Silly American Ideas.**

A GOOD many novel—we regret we cannot say practical—ideas have lately been brought forward by American inventors in the way of motor-car construction. Not long ago one of our transatlantic contemporaries published an illustration of a motor-car to the front of which was affixed a full-sized model of the fore-half of a horse, the claim of the inventor being that horses would be less likely to shy at such a car than at the ordinary horseless vehicle! The same contemporary now briefly refers to another novelty which has lately been patented by an American genius. It consists of a three-wheel tractor fitted with a petroleum-spirit motor. This is intended to take the place of the horse in ordinary vehicles—that is to say, any form of horse-drawn car can be attached to it. Not only so, but unlike other tractors no accommodation is provided on it for the driver. On the other hand, he is supposed to sit in the front of the trailing vehicle and control all the movements of the tractor—starting and stopping the motor, the variable speed gear, and the steering—by means of an ordinary pair of reins! We have carefully read the specification, but can find no mention of the driver's whip to urge on the motor should it prove obstinate!

**2½-h.p. English Motors for Tricycles.**

THE example set by Messrs. De Dion, Bouton & Co. in adopting a 2½-h.p. motor in place of the 1½-h.p. hitherto employed is being followed by makers of similar engines in this country. Although only a few weeks have elapsed since the introduction of the new motor by the French firm was made known in England, the Motor Manufacturing Co., Ltd., of 47 Holborn Viaduct, E.C., and Coventry, are already making a 2½-h.p. motor, while the Beeston Motor Co., Ltd., of Coventry, announce that, when desired, they will fit their tricycles with motors of the increased power. By the way, while on the subject of motor-tricycles, we note the *Scottish Field* falls into a slight error in stating that the Motor Manufacturing Company are offering a De Dion British-made tricycle at £24. If this were so we imagine the Coventry Company would soon have its hands very full of work. Of course it is only the De Dion motor that is offered at this price, not a complete motor-tricycle.

**Motor-Cars and Cycle Makers in Germany.**

JUST as in this country, some of the German cycle companies are turning their attention to the construction of motor-cars and motor-cycles. According to a consular report lately to hand, German cycle manufacturers consider that motor-vehicles are open to improvement and capable of being produced at lower prices, and it is with the object of participating in this new branch that the cycle companies are adding the manufacture of motor-cycles and cars to their existing business.

**A Stanley Steam Car in England.**

A STANLEY steam car has just reached this country from America. It has been brought over by Mr. H. N. Searles, of the Locomobile Co., of Newton, Mass., and yesterday, at Messrs. Mulliner's carriage depot in Brook Street, London, W., we had our first sight of this wonderful production. The car is of the ordinary four-wheel American buggy type, with seating accommodation for two persons. The road wheels are of the suspension type, shod with pneumatic tires, the total weight of the carriage being less than 400 lb. The boiler is fired by means of a petrol burner, automatically controlled. The carriage has, it is

stated, climbed an incline of 36 per cent., and will go up a gradient of 14 per cent. on a country road at a speed of fifteen miles an hour, while on the level it will travel at thirty to forty miles an hour. There is stated to be practically no vibration, no offensive odour, and no noise, except that in climbing hills there is a slight puffing sound. A supply of fuel can be carried for a run of 100 miles, while water is only needed about every forty miles. For further details of the Stanley car we would refer our readers to the description published in our issue of May 9th last. In addition to Mr. Searles, we understand that Mr. A. L. Barber, the President of the Locomobile Co., is now in this country.

**The Persecution of Automobillists and Motor-Car Drivers.**

WE are glad to note that the Automobile Club is taking steps to bring to the knowledge of horse-drawn vehicle drivers the real state of the law with regard to the stoppage of motor-cars on the roads. At the present time there are many who appear to imagine that a driver of a horse can hold up his hand at any time and so cause a motor-car to be brought to a standstill. The Automobile Club has, however, just issued a circular in which the provisions of the regulation of the Local Government Board are clearly set forth. The regulations provide that "Every person driving or in charge of a light locomotive when used on any highway shall (a) on the request of any police-constable (b) or of any person having charge of a restive horse, or of any such constable or person putting up his hand as a signal for that purpose, cause the light locomotive to stop and to remain stationary so long as may be reasonably necessary." In the circular above referred to the Committee counsel drivers of motor-vehicles to show every possible consideration to those in charge of restive horses, and the Committee do not recommend for one moment that drivers of automobile vehicles should disregard any signals which may not fall within the letter of the regulation when there is good cause for such signals, but in view of the fact that this regulation is being used as a means of annoyance to automobilists, it is pointed out that—  
1. No person has a right to require a motor-vehicle to be stopped except (a) a police-constable, and (b) a person in charge of a restive horse. It is clear that a passenger in a horse-drawn vehicles who is not driving has not charge of the horse; therefore (a) a police-constable and (b) the driver of a restive horse are the only persons who can require a motor-vehicle to be stopped. 2. Further, the driver of a horse has not the right to require a motor-vehicle to be stopped unless the horse be restive. The Committee of the Club are ready to supply copies of this circular to members so that they may carry a few of the same with them, ready to present to drivers of horses who give signals to stop without sufficient cause. Of course it remains to be proved whether the circular will result in diminishing the annoyance to which automobilists are subjected in this respect, but that the Committee mean to do all in their power to abate it is indicated by their invitation to members to submit to them any cases of attempts to unfairly or harshly interpret the regulation.

ACCORDING to the daily papers a somewhat serious motor-car accident occurred at Hatfield Peveril, near Witham, on Monday last. Capt. Giles and a friend were journeying from London to Yarmouth in a motor-car, and when opposite the Duke of Wellington Inn a dog ran under the car. Either this had some effect on the steering arrangements or the gentleman in charge suddenly altered its course—the point does not appear to be very clear. At any rate the car overturned, and the occupants were beneath it. Mr. Jones, the landlord of the inn, at once ran to render assistance, and other help was speedily at hand, and the car was lifted. Since the above reached us, we have received a letter, published on another page, from Mr. Rush, of the London Autocar Co., Ltd., giving the true facts of the accident.

## A Large Daimler Motor-Omnibus.

ONE of the latest productions of the Daimler Motor Co., Ltd., of Shaftesbury Avenue, W.C., and Coventry, is a 14-seated covered omnibus, of which we are able to give an illustration herewith. The car is provided with a 4-cylinder motor capable of working up to 12 b.h.p.; it is arranged in front as usual; in fact, the whole arrangement of the motor and transmission is, generally speaking, similar to that of the standard type of Daimler car. It may be mentioned, however, that the rear axle is cranked, enabling the "well" to be dropped between the frame, so bringing the bottom of the 'bus close to the ground. The variable speed-gear is arranged to give four speeds, ranging from  $3\frac{1}{2}$  to 14 miles per hour. Three powerful and independent brakes are provided, while it will be noticed that the steering is controlled by a vertical hand wheel. The road wheels are fitted with solid rubber tires. The interior of the 'bus is handsomely upholstered in cloth and imitation morocco leather.

LA SOCIÉTÉ DES AUTOMOBILES ET MOTOCYCLES AURORA is the style of a new company which has just been formed at 79 Boulevard Haussmann, Paris, with a capital of £6,000.

THE United Motor Industries, of 3 Rue Meyerbeer, Paris, of which Mr. H. O. Duncan is managing director, have sent us a copy of their new illustrated catalogue for the 1899-1900 season. We may say at once that it is the most comprehensive list of the kind we have so far seen; some extent of its magnitude may be gauged from the fact that it extends to no less than 148 pages. To motor-cycles and trailing-cars eighteen pages are devoted, followed by six in which the Bollée voiturette is dealt with. The next nine pages are concerned with voiturettes and light cars, including one or two new types. Two long sections follow, one devoted to motors, component parts, and accessories of every kind for motor-cycles, and one dealing with similar parts for Panhard-Levassor and other well-known cars. In fact, it is difficult to find an article that is not dealt with in the catalogue, a production which should be in the hands of all interested in automobilism.

### THE AUTOMOBILE CLUB.

THE following is a copy of a circular which has just been issued by the Committee of the Automobile Club setting forth the various matters which are at present receiving attention, and also the arrangements which have so far been made with regard to the coming winter season:—

#### PROGRAMME.

The Committee have now under consideration the following matters. Special committees will meet and press forward with these matters as soon as the summer vacation is terminated:—

1. Recommendations to the Local Government Board as to amendments in the Regulations of the Board affecting Light Locomotives on Highways.
  2. The formation of a Society for protection against vexatious prosecutions and vexatious actions at law.
  3. The organization of a Race for touring and racing carriages in France next spring.
  4. The organization of the Second Automobile Club Show, to be held from or about March 24th to April 7th next.
  5. The framing of Rules affecting Automobile Racing.
- NOTE.—At the last meeting between the Racing Rules Committee of the Club and the representatives of the National Cyclists' Union highly satisfactory advance was made towards a settlement of this matter.
6. The representation of British manufacturers at the Paris\* Exhibition of 1900 and at other Exhibitions.
  7. Arrangements for the accommodation of Members of the Club who may be visiting the Paris Exhibition of 1900. It is proposed to rent a small villa near Paris.
  8. The compilation of an accurate list of Motor-spirit Stores, Repairing Firms, etc.
  9. The compilation of a small Pocket Book giving useful information of a non-technical nature.

\* The Automobile Club of Great Britain has, at the request of the Royal Commission for the British Section of the Paris Exhibition of 1900, agreed to co-operate and act as the Advisory Body in respect of the British Automobile Section.

10. Arrangements whereby manufacturers or Members may, at any time, submit motor-vehicles to trial, and obtain a Club certificate as to their capabilities.

11. The formation of Branches of the Club in Scotland, in Ireland, and the provinces.

### NOTICE TO MEMBERS.

#### MEMBERSHIP.

Members of the Club are requested, in order to place the Club in a position to carry out the important work which it has before it, to do their best to obtain new Members for the Club. The subscription of Members elected on and after October 1st next will cover the period ending December 31st, 1900. Members are particularly requested to impress upon all to whom the Club may be mentioned that it is in no way concerned with any automobile firm or company or business undertaking; but that it is an entirely independent body, having for its object only the general advancement of automobilism.

The Automobile Club of Great Britain is recognised as the representative in this country of the Automobile Club de France, the Automobile Club de Belgique, the Automobile Club de Suisse, and the Automobile Club in Vienna (the Österreichischer Automobile Club); and Members of the Club have, under certain restrictions, the right of temporary admission to the Automobile Clubs respectively in Paris, Brussels, Geneva, and Vienna.

#### SHEEN HOUSE CLUB.

The Committee of this Club have agreed that Members of the Automobile Club shall be Members of the Sheen House Club at the reduced subscription which is allowed to officers of the Army, Navy, and Reserve Forces, viz., £3 3s. instead of £5 5s. At present there is no entrance fee, but it is proposed to institute an entrance fee on and from January 1st next.

#### PETROL STORES AND RELIABLE REPAIRING SHOPS.

A revised list of Petrol and Motor-spirit Stores and Repairing Shops is now being prepared by the Club Committee for the use of Members.

Members are invited to send to the Secretary all the information they can as to—

- (1) The price charged for petrol and motor-spirit by the various agents with whom they may be acquainted; and
- (2) The names and addresses of firms or individuals who may be relied on to carry out motor repairs efficiently.

#### WINTER SEASON 1899-1900.

The usual ANNUAL DINNER (in celebration of the completion of the third year since the Light Locomotives Act came into force) of the Club will take place in London on Tuesday, November 19th.

HOUSE DINNERS will be held at the Club on the second Wednesday in every month, viz. :—

Wednesday, December 13th, 1899.

Wednesday, January 10th, 1900.

Wednesday, February 14th, 1900.

Wednesday, March 14th, 1900.

PAPERS will be read and discussions will take place on these evenings.

AN automobile race took place at Belmont Driving Park, Philadelphia, on July 28th. There were three entries—a Winton hydrocarbon vehicle, a vehicle of the General Automobile Company, and a Waverly electrical car made by the Indiana Bicycle Company. The Indiana Waverly vehicle punctured one of its tires on the road to the track, and although it completed the two-mile course, did so not with any hope of winning, but rather to fill the class. The Winton led from the start, and passed under the wire at the end of the second mile about ten feet ahead of the General Co.'s vehicle. The time reported by the judge was 7 m. 38½ s.

## CORRESPONDENCE.

### AN UNNECESSARY INDIGNITY.

TO THE EDITOR OF *The Motor-Car Journal*.

SIR,—In reference to the indignity gentlemen are put to in police-courts because a police-constable wants a day off duty, I should like to speak of an experience of mine. My *fiancé* and myself were riding a tandem cycle *up a rise* when a mounted constable took it into his head that we were exceeding a reasonable pace. Whether we were or not is nothing to do with the present, suffice it to say that, according to the evidence (*sic*) the patrol must have galloped at the rate of thirty-five to forty miles per hour to have overtaken us in the distance that he did! An invitation to Stratford was the result (after much rudeness and incredulousness at a police-station). Ten o'clock was the time of the appointment, and we were compelled to wait till 12.30 in a most reeking atmosphere of "drunks and disorderlies," etc.

There is one satisfaction, and that is that with a motor the driver *only* has responsibility, so that it is not necessary for ladies to get into this position.

Have we not enough influence amongst the ranks of automobilists and cyclists to get this abominable style of managing things altered? I think if you were to use your columns to bring this disgrace to the notice of your readers, and induce your contemporaries to do the same, something might come of it.

Hackney, August 19th, 1899.

Yours faithfully,  
"DISSATISFIED."

### A MOTOR-CAR ACCIDENT IN ESSEX.

TO THE EDITOR OF *The Motor-Car Journal*.

SIR,—You will doubtless have by this time heard that "a serious motor-car accident" took place near Witham, in Essex, last Monday. The real facts of the case are these: I started for a 700-mile tour round the East Coast on Monday, and after a good run as far as Chelmsford, on passing through the little village of Hatfield Peveril a big sheep-dog ran out from the side of the road, getting badly mixed up in our front steering-wheels. This immediately threw us round in the road, and, as luck would have it, at this particular spot the crown of the road was very steep, causing the car to turn right over, the wheels being where the hood usually is, my old friend Mr. Giles, of King's Lynn, being underneath the car. I was, happily, thrown out away from the car and only badly bruised and shaken. My friend was eventually rescued from his awkward predicament by the landlord of the village public-house and a few willing volunteers. The car, I am happy to say, was not in the slightest damaged with the exception of the iron armrails and hood, and it would have been quite possible to have continued our journey. We preferred, however, to wait and have these little defects seen to. This certainly speaks volumes for the good work and material that Messrs. Marshall put into their carriages, as I am convinced that very few cars would have stood the strain.

I should take it as a very great favour if you would kindly point out in your Journal that there should be at the present time a certain amount of sympathy among motor men, as during the time that the car was in its most unnatural position, and my friend Mr. Giles underneath, two motor men came by on a Daimler car. They were signalled to for assistance, but these gentlemen could not find it convenient, I suppose, to lend a hand to rescue a fellow motor man from a most perilous situation.

182 Gray's Inn Road, W.C.,  
August 22nd, 1899.

Yours very truly,  
CHAS. H. E. RUSH.

A COMPANY has just been formed in Paris (135 Rue de la Convention), with a capital of £40,000, to be known as La Société Générale des Voitures Automobiles.

## MOTOR-CARS ON THE CONTINENT.

### "La Locomotion Automobile" Motor Competition.

In previous issues we have given general details of the scheme of our French contemporary, *La Locomotion Automobile*, to assist owners of motor-cars in the matter of ascertaining the horse-power of their engines, and we now append the premier list of engagements, from which it will be noted that already a large variety of types are represented:—

|                             |    |    |                                     |    |         |

### Automobile Meet at Brescia.

A GRAND meet of automobiles has been arranged for September 8th to 11th, at Brescia, and judging from the attractiveness of the programme the reunion should be very successful. The first two days will be devoted to an exhibition of automobiles, while on the 10th and 11th proximo races have been arranged for all classes of vehicles. The course fixed for the 11th is one of 220 kilometres, the greatest distance of any race in Italy. The route is Brescia, Cremona, Mantone, Verona, Brescia, and we understand that the roads throughout are excellent.

### Béconnais at Lons-le-Saunier.

BÉCONNAIS and his motor-tricycle still maintain their form, and at present appear to be all-conquering. Last week we chronicled the remarkable performance at La Rochelle, when 188 kil. were covered in 193 m., and since then this well-known "chauffeur" has scored another victory. This time it was at Lons-le-Saunier, in a motor-cycle race organized by the Automobile Club du Jura, and the win was achieved with the comfortable margin of 1 h. 16 m. in hand. Béconnais covered the distance of 256 kil. in 289 m. 25 s. (4 h. 49 m. 25 s.). The second and third men were Cormier and Castoldi respectively. At the same meeting two other courses were decided, and resulted as follows:—Voitures (distance 256 kil.): 1st, Petit, 5 h. 9 s.; 2nd, Kœchlin, 5 h. 32 m. 4 s.; 3rd, Rigoulot, 5 h. 42 m. 24 s. Voiturettes (distance 126 kil.): 1st, David Amédée, 3 h. 39 m. 31 s.; 2nd, Martin, 3 h. 43 m. 42 s.; 3rd, Chesney, 4 h. 40 m. 16 s.

### A New Amusement.

ALL automobilists and cyclists have met, times without number, the urchin who delights in throwing his cap under the wheels, but a French "gamin" has enlarged upon this dangerous practice, and with serious consequences. Seeing the approach of an automobile containing Edmond Beer and a mechanic, this small boy deposited on the road several large stones, so arranged that the car could not avoid striking them. The result was the upsetting of the carriage, without, however, the occupants receiving any very grave injuries. This incident occurred at Deauville on Monday last, previous to which the boy's brother had been arrested for a similar offence.

### An Exhibition at Ostend.

ON the day following the termination of the Paris-Ostend race, that is to say, Saturday, September 2nd, there will be held in the Kursaal of Ostend an exhibition of all the placed automobiles. We are pleased to note that by a further change in the itinerary the amount of *parcours* to be negotiated in the race has been reduced by twelve kilometres.

### M. G. A. Rives.

ON the recommendation of the Minister of Commerce and Industry, M. Gustave Rives, member of the Automobile Club de France, and director-general of the two Exhibitions of Automobiles, has been nominated a Chevalier of the Légion d'Honneur, and the French automobile world has rejoiced accordingly. An architect by profession, M. Rives has carried out many important works. Among those in Paris may be cited the establishments of the Crédit Lyonnais, Dufayel, and last but not least the extensive alterations and additions to the Automobile Club's hotel in the Place de la Concorde. But it is M. Rives' splendid work in connection with the Tuileries Exhibitions that appeals most to the automobile world at large. The labour entailed in creating and organizing such an exhibition as that of 1898 was immense, and in 1899, when, in the ordinary course of events, the work would have been materially simplified, the action of the Government in closing the Club a week or two previous to the opening of the show complicated matters tremendously. That these complications were successfully overcome was witnessed by the production of a magnificent exhibition, the administration of which was complete in every detail.

### Motor-Cars in Greece.

*La France Automobile* announces that the Hellenic Government has passed the first reading of a Bill providing for the establishment of automobile services in various parts of Greece, and that a thirty years concession in respect of the same has already been granted to M. Moraitinis, of Athens.

### Daimler Motors in Austria.

THE OESTERREICHISCHE DAIMLER MOTEREN GESELLSCHAFT (Bierenz, Fischer & Co.) is the title of a company which has just been formed in Vienna to construct Daimler motors and motor-vehicles in Austria.

MESSRS. POUGNAUD & BROTHIER is the name of a new concern which has just been formed at Villefagnan, France, with a capital of £4,800, to manufacture motors, carburettors, and automobiles.

ACCORDING to the British Vice-Consul at Trapani (Sicily), a company will undertake the transport of passengers from Trapani to Alcamo Station, making a direct track which will have the effect of rendering the journey from Trapani to Palermo much shorter than it is at present. The cars have been purchased in Paris.

THE city authorities of Buffalo, N.Y., have made a contract with the National Motor Transit Company for the operation of automobile-vehicles in the city parks. The city gives the Company a one-year franchise for the nominal sum of one dollar. The Company may charge five cents for a single trip. The Company assumes all liability from accidents arising from frightened horses. The carriages must not be run at a greater speed than eight miles per hour, and their design must be approved by the park authorities. The Company will first try petrol carriages, but may change to electric vehicles later on.

## The Déchamps Petroleum-Spirit Motor-Voiturette.

WE are enabled this week to give an illustration of a neat two-seated motor-voiturette which has lately been introduced in Belgium by the Société Anonyme des Ateliers H. P. Déchamps, of 31 Rue Frère-Orban, Brussels. The car is provided with a two-cylinder vertical petroleum-spirit motor. It is located in the front portion of the car under a perforated bonnet, and is described as being capable of developing up to  $4\frac{1}{2}$  h.p.; the ignition is electrical, the carburettor of the Longuemare type, while the cooling of the cylinders is effected by means of radial discs assisted by a small high-speed fan driven off the motor-shaft. Three forward speeds—10, 20 and 30 kilometres per hour—as also a backward motion are provided. The transmission of the power of the motor to the rear road-wheel axle is effected entirely by gear wheels, no chains or belts being employed. The car is provided with wheels of the suspension type fitted with Michelin pneumatic tires, and its weight complete is given as 300 kilogrammes, or not quite 6 cwt. In a letter to us the makers state that a vehicle of this type took part in the recent Brussels-Spa race, and that it was the only car which got through without a breakdown.

A NEW firm has just been formed at Levallois-Perret (Rue du Bois), France, under the style of Messrs. Lamaudière et Labre, to construct a new type of motor-bicycle devised by M. Labre,

PASSING along Great Eastern Street, London, E.C., the other day, we noticed that Messrs. Casswell & Co., Ltd., cycle factors, are just now displaying a motor-tricycle fitted with a De Dion motor constructed by the Eadie Mfg. Co., Ltd., of Redditch.

A NEW petroleum-spirit motor for horseless vehicles has just been introduced by the St. Louis Gasoline Motor Company, 822 Clark Avenue, St. Louis, Mo. The points aimed at by the makers have been simplicity of construction, durability, a combination of small weight and great power, the enclosure of all working parts, and the class of workmanship. The motor, which is of the horizontal type, is of 2 h.p.; it weighs only 89 lb., and occupies a space of but 24 by 11 inches.

## THE PARIS-LILLE RACE.

(From Our Own Correspondent.)

ALTHOUGH the elimination of the carriage category in this race had the natural effect of materially reducing the public interest in the *course*, still, such was the number and quality of the competing motor-cyclists that a crowd of fair proportions assembled to witness the start at Chatou on Sunday morning last. For once in a way the time of departure had been fixed at a reasonable hour, that is to say at 10.30, hence we enthusiasts were spared the painful necessity of rising at an unearthly hour in the morning, a proceeding usually imperative if one wishes to see the initial stage of an automobile race in France. The road from Paris to the pleasant little suburb of Chatou leads through Neuilly, Courbevoie, and Nanterre, and consists almost throughout of *pavés*, the horrors of which, from an automobile or cycling point of view, baffle description. It was therefore with a feeling of thankfulness that I descended from my bicycle at the *contrôle* fixed on the Saint-Germain road and proceeded to watch the arrival of the competitors, the majority of whom were unmistakably glad to dismount from their racers after the fearful run out from Paris. In some respects the few minutes preceding the start is, I think, the most interesting feature of a race. It is then that one has an opportunity of examining the machines, the motors, and the hundred and one small parts and accessories carried by the competitors to meet all eventualities. It is of interest to note the different demeanours of the participants themselves: the feverish anxiety of some, the cool deliberation of others; the rapid adjustments and trials made at the last moment and the bustle and excitement of getting into line for the start. At Chatou all the actual starters had put in an appearance by 10 o'clock. They numbered twenty-five, but at the moment of departure Gasté discovered, to his dismay, that his machine would not move, although the motor would run gaily. A journey of 258 kilometres under these conditions would probably have been wearisome, so Gasté wisely abandoned the attempt. The other participants were:—1, Oury; 3, Rigal; 4, Tart; 5, Baras; 7, Bertin;

| Do. .. .. .                                  |  |      |      |     | do.                    |      |      |     | do.           |      |      |     | 12½  | 1 in 9½             | 16½                           |
| Do. .. .. .                                  |  |      |      |     | do.                    |      |      |     | do.           |      |      |     | 10   | practically on flat | 6½                            |

\* Driver was slow in getting on brakes.

11, Merville; 12, Willaume; 14, Lille; 15, Lepoutre; 17, Caron; 20, Vasseur; 21, Rivière; 23, Bardin; 24, Osmont; 25, Théodore; 26, Deneux; 27, Roquette; 28, Caillois; 29, Degré; 30, Sylvere; 31, Adolphe; 32, Gleize; 34, Tampier; 35, Zenfuehi.

They were duly despatched without mishap, and when passing my point of vantage, situated at the foot of a hill some 2 kilometres from the start, Osmont, Baras, Willaume and Rigal lead the way, travelling at a speed of probably 60 kilometres per hour. Lepoutre was almost immediately placed *hors de combat*, as he ran into a cart, and at Beauvais (76 kilometres) Rivière also abandoned. At Breteuil (105 kilometres) Bertin, mounted on a machine fitted with two Aster motors, retired; the time of the leader (Baras) at this point being 115 minutes. Throughout Baras was never headed, and eventually reached Lille at 3.45, where he covered the required five laps on the track, and finished at 3 h. 48 m. 35 s. having completed the journey of 258 kilometres in 5 h. 18 m. 35 s. Meeting with an accident at Arras he terminated the course on a borrowed machine, and on this ground Osmont, the second man, has lodged a protest, which on the face of it, will probably be upheld. The other competitors arrived as follows:—3rd, Tart in 5 h. 31 m. 13 s.; 4th, Gleize in 5 h. 33 m. 22 s.; 5th, Willaume in 5 h. 35 m. 2 s.; 6th, Caillois in 5 h. 38 m. 28 s.; 7th, Rigal in 5 h. 40 m. 15 s.; 8th, Bardin in 6 h. 2 s.; 9th, Tampier in 6 h. 1 m. 13 s.; 10th, Sylvere in 6 h. 10 m. 47 s.; 11th, Roquette in 6 h. 17 m. 17 s.; 12th, Merville in 6 h. 46 m. 25 s.; 13th, Vasseur in 7 h. 6 m. 33 s.; 14th, Lille in 7 h. 17 m. 35 s. Many of the competitors had experienced trouble in some form or other, but no serious accidents occurred.

Following the race, there was decided on Monday afternoon on the Lille track a *course* styled the Championship of the World. The heats were of 5,000 metres, and the final of 10,000 metres. The placings in the final were as follows: 1, Osmont; 2, Rigal; 3, Sylvere Accou; 4, Vasseur; the time of the winner being 11 m. 52½ s. The race throughout was of the most exciting nature, and aroused the spectators to a great pitch of enthusiasm.

MOTOR-VEHICLES are being used on several "shoots" in Scotland this year. Mr. Roger Wallace, Q.C., is using his motor in Inverness.

THE *Umpire*, of Manchester, *apropos* of the case against the Hon. Charles Rolls, re-assures nervous pedestrians as to the character of the motor-car. "It means no harm," says our contemporary, "and it wouldn't dream of doing any; it does not revel in death and destruction, and it would no more wilfully run over a human being than it would intentionally crush a worm."

## RAISING THE SPEED LIMIT.

### THE AUTOMOBILE CLUB TRIALS BEFORE THE LOCAL GOVERNMENT BOARD OFFICIALS.

IT will be recollected that some short time ago the Local Government Board requested that the Automobile Club should organize trials to take place before their officials with reference to the application which had been made to the Board that the limits of speeds for vehicles weighing 30 cwt. and upwards should be raised. The object of the trials was to ascertain by accurate experiment the stopping-powers of heavy motor-vehicles. The Club invited a number of firms to supply vehicles for the purposes of these trials. The companies who went to the trouble and expense of supplying vehicles for the occasion are to be heartily congratulated on the public spirit they have thereby shown.

At the trials—which were held on Friday last, the 18th inst.—the first arrival at the Star and Garter Hotel, Richmond, was the Clarkson & Capel lorry, which had a load on board of 2 tons of granite, kindly supplied by the Surveyor to the Borough of Richmond; the second arrival was the omnibus of the Motor Traction Co., Ltd. (late London Steam Omnibus Co., Ltd.); and this was followed by the Thornycroft steam lorry, carrying a load of 3 tons, and a Daimler post office van with a load of 30 cwt.

The Local Government Board was represented at the trials by its Chief Engineering Inspector (Major-General C. Phipps Carey, R.E.), the Deputy Chief Inspector (Colonel J. O. Hasted, R.E.), Second Deputy Chief Inspector (Mr. Rienzi Walton), and one of the Inspectors (Mr. Willcocks). The trials were carried out under the superintendence of the Secretary of the Automobile Club, assisted by Mr. Julius Harvey (who acted as starter), Mr. Thomas Clarkson (who acted as timekeeper), and Mr. Foster Pedley (who held a second watch). Mr. Straker, the engineer to the Motor Traction Co., Ltd., accompanied the petrol omnibus.

The trials consisted of stopping the vehicles while running down Petersham Hill at Richmond at an unexpected signal, the speed of the vehicle before stoppage as well as the distance covered in stopping being both carefully measured. Similar tests were carried out on the flat. The results of the tests are given in the table above.

THE *Irish Cyclist* states that the Waterford motor-car was to have been hired by some well-known sportsmen from Kilkenny for a run to Tramore Races last week, but some hitch occurred and the vehicle was not availed of. It is reported that a well-known car owner in the district is going to invest in one for the purpose of excursions. If he does it will create a great stir there.

## MIDLAND MOTOR NOTES.

By "HERCULES."

### A Midland Motoring Centre.

STONEBRIDGE, the Ripley of the Midlands, is the calling place for thousands of cyclists, and this summer one can hardly pay a visit without finding motors in evidence. There are vehicles of all descriptions, and the motor-tricycle always attracts attention. The speed cyclists who endeavour to "hang on" are not slow to appreciate the speed of these tricycles. Breakdowns are not met with frequently, although the roads around Coventry are practically the testing ground for motors. Unfortunately the police in this district swoop down upon motorists who are experimenting with cars to test their speed capabilities, and however careful the drivers are to select a quiet course the police are ever ready to do their duty. But the magistrates are not vindictive, and small fines are the rule. Furious driving, however, in Coventry's congested streets meets with more severe sentences, as it should. J. W. Stocks was summoned to appear before the County Bench at Coventry the other day. He sent a representative, and the Bench allowed the case to be heard in his absence. Stocks admitted to a speed of eighteen miles per hour while travelling to London, and a fine of 10s. and costs was not excessive under the circumstances. On the Continent motor manufacturers are afforded facilities for testing vehicles on the road. In fact, in the recent race from Bordeaux to Paris a large number of policemen were employed to keep the roads clear. How English manufacturers would enjoy such privileges!

### The Care of Motor-Vehicles.

It is not too much to say that in nine cases out of ten failures are due to carelessness in driving or want of proper supervision. A few weeks ago the writer was out with a friend on a motor-car, and a few miles from Coventry we had a stoppage. An examination of the engine revealed the fact that there was practically no oil with which to run it, and the bearings had become so hot that some oil had to be borrowed from a friendly cyclist's lamp. I am afraid our imprecations upon the individual who had neglected to provide the oil before we started had but little effect. This case is only cited to show that breakdowns are not always due to defective workmanship. During the past two years great improvements have been made in the construction of engines with a view to making everything as simple as possible to the non-practical person.

### More Experimental Work in the Midlands.

Now that trade with most of the Coventry and Birmingham cycle firms is slackening off, managers are turning their attention to motor-car manufacture. Many leading firms have purchased new and second-hand motors or the purpose of becoming acquainted with their mechanism, and those in authority are of opinion that this is the very best way of gaining experience.

### The Motor Manufacturing Co.'s Employees' Outing.

THE Motor Manufacturing Co.'s employes held their annual outing on Saturday last at Stratford-on-Avon. The journey was made *via* Kenilworth and Warwick in brakes. In the unavoidable absence of the manager, Mr. Geo. Iden, dinner was presided over by Mr. Thomas, who made a very sensible speech, and urged the workmen to study their own interests by first looking after the interests of the Company, and by devoting all their energies to turn out the very best of work possible. By such means they would further advance their qualification to be first in the motor industry. The afternoon was given over to outdoor amusements, and the return journey was much enjoyed.

### The "Allard" Motor-Tricycles and Cars.

LAST week W. Williamson, of the Allard Cycle Co., Ltd., Coventry, rode a motor-tricycle from Coventry to London in just over four hours. He rode right through without a hitch and without stopping, lubricating the parts while in the saddle. This firm has received quite a number of orders for motors and tricycles, and are completing two small cars, one to carry two passengers and the other four. We have been promised a trip in one of them, and will report our experiences in a subsequent issue.

### The Endurance Motor-Car.

MR. HALLETT, of the Motor Endurance Co., Ltd., took a car to London the other day from Coventry in about 7½ hours, a very fair performance for the ninety-two miles. This Company have just increased their capital, and expect shortly to extend their works so as to enable them to meet the increased demand for their motors.

### A Great Yarmouth Visitor.

THE other day I came across Mr. Crampton, of Great Yarmouth, a member of the Automobile Club. Mr. Crampton had ridden on his motor-tricycle to Coventry on business, as is his custom, and he states that everywhere he goes he witnesses the development of the motor industry. Mr. Crampton, who travels great distances on his tricycle, was one of the first to start motoring in Suffolk. At the present time there are four or five Daimler cars in Great Yarmouth doing a thriving business in passenger traffic.

### Another Birmingham Concern Takes Up Motors.

I LEARN from Mr. E. Gascoine, who is now with Messrs. Alldays & Onions, Birmingham, that this firm has several new motor-cars in course of construction. Arrangements are, I understand, also in hand whereby this concern will shortly be able to undertake repairs to any type of motor-vehicles, a staff of experienced men in this class of work having been obtained.

### A Motor-Tricycle Accident.

MR. G. W. HANDS, managing director of the Bard Cycle Co., Ltd., Birmingham, while out touring on his motor-tricycle in the neighbourhood of Bristol, met with rather a nasty accident, but on enquiry I find he is progressing satisfactorily and hopes to be out again in a few days.

### An Impromptu Shower Bath.

AN amusing incident occurred in one of the Coventry streets the other day. A motor driver was laying on his back in the roadway repairing a car when a water-cart passed and the motorist had an impromptu shower bath. It was no doubt more refreshing than pleasant even in this hot weather, and for a few minutes the language was plain and free between the driver and the water-cart man.

ON Saturday last a fire at Guinness' Brewery, Dublin, extended to the motor-car house and considerably damaged three cars.

MR. DAN ALBONE, of Biggleswade, Beds, has sent us a copy of his new cycle catalogue, in which prominence is also given to ball-bearing hubs and axles for horse-drawn and motor-vehicles. It is well-known that Mr. Albone has for some time been devoting attention to motor-vehicles, and he now announces that he is prepared to make and supply complete motor-cars.

## MOTOR-CAR AND CYCLE RACES IN FRANCE.

—B—

### THE REGULATIONS OF THE COMMISSION SPORTIVE OF THE AUTOMOBILE CLUB OF FRANCE.

**M**OTOR-CAR races, which up to now have been submitted to no strict regulations except that of not hurting anybody and arriving first, if possible without making use of the train (!), will next year be ruled by the following regulations.

Hitherto everything has gone on all right, and nobody grumbled. All the races took place without causing any injury, and nobody dreamt of complaining. But now this is over, and general regulations will be made to apply to particular cases. Every time any one is not satisfied with his fate the consequences will be recriminations, law suits, etc., etc. But the work is achieved—the Commission Sportive of the Automobile Club has drawn up a series of regulations which has been declared valid for the year of grace 1900 over the whole of France.

As it will no doubt be of interest to some English "chauffeurs" to know exactly the laws laid down by the Commission Sportive relating to motor-car races in France, I append a short but complete enumeration of the rules.

*Introduction.*—1. The Automobile Club of France is the only association regulating motor-car and cycle races in France.

2. The following regulations are made with the idea that it is the machine and the driver who must go over the whole course without disjunction:—

*General Rules.*—No. 1. Every one entering a competition is supposed to know the present regulations.

*General Dispositions.*—No. 2. All races or records (motors) are ruled in France by the regulations of the A.C.F.

No. 3. All races in which these rules are not followed will be interdicted, and those who participate in such races disqualified.

*Publication of Programmes.*—No. 4. The programmes of the races must be (1) sent to the Commission Sportive, and (2) published in the press at least five days beforehand for track races, and a fortnight beforehand for road races.

No. 5. The programmes must contain: 1. The full enumeration of the prizes. 2. The distances. 4. The date of the closing for entries. 5. The amount of the guarantee (*forfaits*) if such is stipulated. 6. The full itinerary of the race.

No. 6. No modifications can be made to the programme.

No. 7. A copy of the programme must be given to every competitor inscribed.

*Classification of the Races.*—No. 8. The races must be free or reserved. The races reserved are those which only apply to a class of races stipulated by the organizers.

*Categories.*—No. 9. The different classes of vehicles recognised by the A.C.F. are (1) motor-cycles, etc., not weighing more than 250 kil.; and (2) vehicles weighing over 250 kil., and carrying two persons side by side of a minimum weight of 70 kil. each.

No. 10. The Commission Sportive is the only judging body as regards questions of classification.

*Entries and Guarantees.*—No. 11. The organizers have to fix the entry fees, and may make them returnable or not.

No. 12. Any guarantee must be stipulated in the programme.

No. 14. Entries must be made in writing, within the time fixed, or by telegram followed by a letter of the same date.

No. 16. Any false declaration made by the competitor may render him ineligible for the race.

No. 17. Any person running under a pseudonym must have it accepted by the Commission Sportive.

No. 18. The pseudonym can only be changed if a sum of 20 francs accompanies the demand.

*Commissaires or Judges.*—No. 19. Every race must be directed by three commissaires chosen by the organizers, and whose names must be communicated and accepted by the Commission Sportive.

No. 20. The execution of the programme and also of the present regulations are in the hands of the commissaires, who shall also give decisions in case of any dispute.

No. 21. The commissaires can prevent any competitor from participating in the race if they consider his car dangerous or the driver inexperienced.

No. 22. The commissaires can inflict penalties up to 200 francs, and disqualify for a maximum period of one month.

No. 23. The commissaires must refer to the Commission Sportive if they consider the penalty should be higher than the above-mentioned sum.

No. 24. The starter is chosen by the commissaires and is the only judge as to the validity of the start.

No. 26. The competitors are to be started in the order of entry, unless the programme makes other stipulations.

*Arrival Judging.*—No. 28. The arrivals must be judged by a single person, who, however, may ask for the assistance of others. The judge must be accepted by the commissaires of the race.

No. 30. In case two competitors arrive together it shall be proclaimed a dead heat, the first two prizes being divided between them.

No. 34. It is sufficient for one competitor to start in a race for him to have a right to the first prize.

*Curves and Turnings.*—Special marshals have to be located at turnings to see that no competitor acts in such a way as to prevent the other from passing, or to cause him any accident.

*Track Races.*—The regulations are more or less the same as those which apply to motor-tricycles.

*On the Road.*—No. 39. Any competitor who in a race crosses another one, or gets too close to him, and prevents him going on, is considered as disqualified unless he is obliged to do so on account of a third vehicle. The fact of the obstruction being involuntary is in no way considered as a sufficient excuse.

No. 49. In road races the approach of vehicles must be announced by means of horns.

No. 50. During the night vehicles must have at least one white and one green light at the front, and a red light at the back.

*Regulations of Records.*—These regulations are more or less the same as in other sports, consequently they do not call for any lengthy reference.

*Validity of the Present Regulations.*—The above regulations are obligatory, and will come into force on January 1st, 1900.

Vive la Liberté!

D. FARMAN.

THE English Automobile and Motor Co. is the name of a company which has just been formed in Chicago to manufacture and sell rotary engines and automobiles, etc. The capital is £1,000,000!

WE learn that Mr. H. Mulliner, of the well-known carriage-building firm of Brook Street, W., has taken up an agency for the Bleriot acetylene carriage lamps. These lamps, which it will be remembered were displayed at the recent exhibition at the Agricultural Hall, are used by all the leading automobilists in France.

ACCORDING to a telegraphic despatch, Mr. Alexander Winton, the builder of the Winton motor-carriage, left Cleveland on the 16th inst. for New York in one of his vehicles. At Chicago he was to receive a message from General Anderson, Military Commander of the Lakes District, to be delivered to General Merritt at New York. Mr. Winton expected to cover the distance, 1,100 miles, in six days, and hopes to demonstrate the utility of the automobile for carrying messages in time of war. Mr. Winton is using a very heavy carriage, built specially for the trip.

## SOME USEFUL ACCESSORIES.

THE proper lubrication of the motor and the various parts of a motor-carriage is a most important point, and one which, if neglected, is most likely to spoil the pleasures of motoring, if, indeed, not to lead to more serious results. It is therefore satisfactory to find that the needs of automobilists in this connection are now being catered for by several concerns, among which are Messrs. Stern Brothers, of 57 Gracechurch Street, London, E.C. This is an old established firm of oil, grease and lubricator manufacturers which is now vending quite a number of lubricants suitable for motor-car users. One speciality is the "Fram" motor lubricant. This is specially prepared for motor-car axles and differential gears; it is particularly heavy and economical, exceptional lubricating and cooling properties being claimed for it. The "Sternoline" lubricant, which is adapted for bearings, is a semi-solid paste, free from acid and impurities, non-corrosive, and capable of being stored for years without deterioration. It possesses a high melting point, and lubricates in its ordinary condition without becoming molten. The "Sternoline" elastic paste for gear wheels and chains is stated to be used by most of the leading French motor companies, as well as by several English motor-car builders. It is intended to be applied every two or three months, and forms a covering on the gear wheels and chains which reduces the wear and tear and noise to a minimum, and keeps these parts efficiently lubricated and free from dust. It is also claimed to be economical in use. For automobilists using belt-driven cars Messrs. Stern supply what they term their belting brick. The belts are occasionally rubbed with these bricks, which weigh 2 lb. each, and are so kept soft and pliable while slip is prevented. The "Sternoline" motor-bearing and cylinder oil is another lubricant to the production of which the closest attention has been given. It is stated to possess an exceedingly high flash-point, free from all impurities, and is particularly recommended for both cylinders and engine bearings. An efficient rust-preventive paste and a stainless motor-car and cycle oil, the latter being a colourless oil of heavy body, are also included in the list of this firm's productions. In addition to lubricants Messrs. Stern are also supplying lubricators suitable for use on motor-cars. Four types are made, the "Sternoline Stauffer," dustproof screw, spring pressure automatic, and feed drop lubricators, the latter for liquid oil. The three first-named are constructed to hold sufficient semi-solid lubricant for several weeks' use, according to size and the number of hours run. The screw-down types require an occasional turn of the screw from time to time, so as to force the lubricant into the bearing, but the automatic lubricator requires no attention except for the purpose of refilling. The improved "Sternoline" screw lubricator is the type particularly recommended for motor-car use. It is quite dustproof, and the feed is obtained by turning the screw once or twice a day.

"MOTOISTS" is the latest term adopted for those who make use of motor-cars and cycles. It is the invention of a Midland newspaper.

THE Detroit Automobile Co. has been formed at Detroit, Mich., to manufacture and sell automobile vehicles, etc. The capital is £30,000.

It is announced that a company known as the Thames Valley Motor-Car Company is being formed for the purpose of running a service of Daimler motor-brakes between Richmond and Hampton Court, *via* Twickenham and Bushey Park.

It is reported that Baillie Lyon, of Aberdeen, has ordered a motor-omnibus to convey the people to and from the Bathing Station in the northern city. The omnibus in question is similar to that shown at the recent Exhibition at the Agricultural Hall by Messrs. Bayley, Ltd.; it is constructed to carry twelve persons inside and fourteen outside.

## SCOTTISH NOTES.

### "The Twelfth."

THE whirr-r-r of the startled grouse and the bang of the sportman's gun have taken the place of the peaceful quietness which a few days ago reigned supreme in the Highlands of Scotland. The Twelfth has come and gone, and a scorching day it was! Indeed, unless in the early hours of the morning before the sun shone forth with burning intensity, shooting partook more of the nature of a weariness to the flesh than sport. "But what has all this to do with motor-cars?" I can imagine I hear my Editor growl. Well, I have just seen a very substantial and business-like motor-car fresh from the Hamilton factory on its way to Strathpeffer, and on making enquiry I found it was intended to be utilised for shooting purposes. The vehicle, which has a Daimler motor, is built on Stanhope lines, only there is no entrance from behind. Both seats face the front, and admission to the back one is gained by lifting up a half of the front seat. It is extremely roomy and could accommodate a shooting party of five along with dogs and guns with comfort. The wheels were yellow, and the body natural varnished walnut, and altogether the car looked decidedly smart and serviceable.

### Nobility and Motor-Cars.

HIS Grace the Duke of Hamilton, who is expected at the Palace of the same name this week, is another nobleman who is interested in a quiet way in motor-cars. Last year he drove by the new method of locomotion up to Grouse Lodge, his shooting box in Avondale, on several occasions, and was delighted with the comfort and rapidity of the various automobiles which took him there. I expect a few more trials of the horseless carriage on the occasion of his present visit will result in his becoming the owner of one of these useful machines.

### More Advantages.

As a matter of fact, the advantages of a motor over a horse for work at a shooting lodge are great. Often a drive of several miles to convey sportsmen, guns, dogs, and luncheon baskets has to be made, and when the *locale* of the "shoot" has been reached the horse or pony has to be taken often a considerable distance to be stabled at a farmhouse. With the vehicle one has no need to trouble about stable accommodation or even the weather. The car can be pulled up at the side of the road nearest the moor to be shot over, and left standing there all day without requiring any attention. The moral is obvious: it is only a question of time, and, despite the sneers of anti-motorists, we shall one day hear the hum of the merry motor as it rapidly conveys a load of "sports" to their destination. Regarding the Strathpeffer car before referred to, another gentleman says that if it proves satisfactory he and several friends will immediately go in for similar vehicles.

### The Limit of Speed.

TALKING about speed on the highways, the chief constable of one of the largest counties in Scotland said recently to an autocarist of his acquaintance that he did not see why motor-cars should not be driven from twenty to thirty miles an hour in the open country, so long as one could see a clear run a long way ahead and slowed down when approaching other machines or in going through towns and villages. From what I know there is no one fonder of a good smart "spin" than the self same representative of law and order. I have seen him myself being driven a good sixteen miles an hour on a delightfully undulating country road, disturbed by little or no traffic, not a

hundred miles from his own head-quarters. He recognises the admirable control a competent driver has over his machine, which makes it infinitely more easy to handle than a horse-driven trap, and he is sufficiently broad-minded to admit that such is his own opinion, although it is not the law's.

#### More Wise Horse Drivers.

WHILE motoring through Crossford recently I was much struck with the plucky behaviour of a silver-haired old dame, who could not have seen less than seventy summers. She was driving a little market cart, to which was harnessed a fairly fiery-looking young pony. We slowed down on approaching, but the pony turned completely round and looked as though he meditated a "bolt." The old lady pulled it up sharply, and gave it a smart cut with the whip to show she would stand no nonsense. One of our party by this time had run to the pony's head and helped to bring it round. The plucky driver set it going again, and we thought it had got over its nervousness, but on approaching our by this time perfectly "dead" motor (we had stopped the engine) it again wheeled sharply round, nearly upsetting the light vehicle it was pulling. The old dame's spirit was up by this time, and with a "Na, na, I'm no gown to be beat with the powny, he'll have to pass lots o' thae things some day" she argued out the point with her stubborn steed till in the end she conquered, and made him walk closely past the monster who had inspired him with so much alarm. It is pleasant to record an instance of this sort, for as a general rule a meeting of this kind is usually attended with a more or less voluble flow of lurid and picturesque language.

"BROWN HEATHER."

### THE PY MOTOR-VOITURETTE.

A NEW motor-voiturette, which at first sight appears to resemble the well-known Bollée, but which on closer inspection differs considerably therefrom, has lately been put on the market in France by the Compagnie des Automobiles du Sud-Ouest, of which M. André Py, the designer of the vehicle, is the manager. As will be seen from the illustrations (Figs. 1 and 2) the vehicle has three wheels, and has seating accommodation for two riders back to back. The motor *C* is of the single cylinder horizontal petroleum-spirit type, provided with radial discs for cooling purposes, and tube or electric ignition. It is capable of working up to  $3\frac{3}{4}$  h.p. It is located on the left-hand side of the frame, with the explosion chamber at the rear. The exhaust valve *S* is controlled by a small longitudinal shaft *o*, actuated by worming gearing *d* from the motor-shaft *A*. A centrifugal governor *r* is mounted on the shaft *o*, and prevents the exhaust valve being opened when the speed of the motor becomes excessive. The silencer is located at *x*. Three forward speeds—8, 18 $\frac{1}{2}$ , and 29 kilometres per hour—and one backward motion are provided, these being obtained by a series of gear-wheels on the motor-shaft *A* and the counter-shaft *a*. The handle *m* controls the forward speeds and the lever *l* the backward motion. A friction clutch *G* is arranged in conjunction with the fly-wheel *V*, so that the motor can be instantly thrown out from the transmission gear. Contrary to the Bollée, the Py voiturette is front driven and rear steered, the power of the motor being transferred to the front road wheels *RR'* through the counter-shaft *o* and the gear wheels *E*, a differential gear being provided on the opposite side at *D*. A handle is provided at *M* for putting the motor in operation. Steering is effected by the hand wheel *f* connected by the rack and pinion gear *e* with the rear wheel *F*, the latter being mounted in a special way. A lever *L*

controls a band brake on the differential gear, while a foot pedal *p* actuates two band brakes on the intermediary shaft *a*. All the transmission gear is arranged under the seats, where is also located the petrol storage tank, which has a capacity of 12 litres. The vehicle is 9 ft. long and 4 ft. 8 in. in width, while the seats are only 4 ft. above the ground. The centre of

FIGS. 1 AND 2.—ELEVATION AND PLAN OF PY VOITURETTE.

gravity is thus very low, and renders the vehicle exceedingly stable. The wheels are of the cycle type with pneumatic tires. The mudguard over the rear wheel is arranged to act as a luggage carrier, so that the vehicle may be used for touring purposes. It is claimed that the car can mount gradients of 10 and 12 per cent. even with a load of 6 cwt.

THE *Automobile* is the title of a new American illustrated monthly magazine to be devoted to the interests of horseless traction which it is proposed to bring out in October next by the United States Industrial Publishing Company of New York. It will be edited by Mr. Sylvester Baxter and Mr. E. E. Schwarzkoff.

MR. J. BURNS, of 44 Berners Street, London, W., sends us particulars of a novel form of spring cushion and seat he is introducing into this country suitable for use in motor-cars, as also in railway carriages, omnibuses, and vehicles of all kinds. The seats are constructed of a set of tempered steel blades arranged transversely, and having at their extremity a special bend, and hinged upon two parallel rods. Round copper shields suppress, it is claimed, the noise which would otherwise be produced by the rubbing of steel on steel. The blades are joined at the centre by a longitudinal band upon which they are clamped. In order to compensate for the too great flexibility of the blades in the middle, and to obtain a uniform elasticity, this band rests upon oval springs. By this arrangement the weight is transmitted by the blades, partly by their flexibility and partly in rotation round the rods, which reduces the work of the steel. The apparatus is contained in a light wooden frame, on which are screwed the hinges and the band springs. This frame enables the covering, which can be of any desired material, always to retain the same shape. This system has been devised to avoid the inconvenience attending metallic springs, and to replace horse-hair cushions. The apparatus is described as being simple, unbreakable, non-rusting, and as not showing—even after a long wear—any traces of malformation. Furthermore, the seat is very light, and, on account of the construction with the inside cavity, it is hygienic and cool.

# THE GENERAL PUBLIC AND MOTOR-VEHICLES.\*

THERE is a large opportunity to study the one-sided mental characteristics of both horses and drivers in connection with the motor-vehicles. Many amusing instances occur daily, and some very interesting reading could be had if they were collected and classified.

It is commonly supposed that the noise of the new vehicle is what scares horses, but it is very easily proven that such is not the case. Both horses and drivers recognise that it is a new thing, and their astonishment sometimes amounts to fright. For example, when coasting hills it is our practice to stop

the motor and control the vehicle by clutches or brake, or both, so that there is no puffing nor noise of gearing, and the carriage is practically as quiet as a bicycle. It is also our practice to go slow, keeping the vehicle in perfect control, and with the ability to stop it at any point on the hill; yet under these circumstances horses get as badly frightened sometimes as when the motor is running, proving conclusively that it is not the noise that scares the horse. Neither is it the shape of the vehicle, for some of our vehicles cannot be told at a glance from horse vehicles.

It is the simple fact that a vehicle without a horse is a strange, and to the horse an unaccountable, thing. Many instances could be cited to show that the same feeling exists among people, particularly children, and while most people have no fears, some instances of adults getting badly scared could be cited.

The most common feeling, however, is complete astonishment and an utter forgetfulness of everything excepting the sight in front of them. This accounts for a driver sitting still in his vehicle with loose lines, while the horse does a can-can, to the danger of all concerned. Many times we have vainly shouted to the driver to look out for his horse, while he, in open-mouthed wonder, failed to see anything but our vehicle.

It is a common remark also that motor-vehicles are noisy, although people immediately ask us why we do not put on a bell lest we run over somebody, and further ask us how we came down the street without their hearing us, both of which remarks show very plainly the absence of noise and also show that peculiar condition of a man's mind which, because a motor-vehicle is in question, presupposes noise.

It is pleasant to note, however, that these new and adverse conditions are now changing. The public are rapidly waking up to the advantages of the mechanical motor over the horse, and encouragement rather than opposition is becoming the order of the day.

Another phase of the mind is shown by people's views as to what the motor-vehicle ought to be, having nothing except their own imaginations to guide them. They are more or less disappointed with every vehicle shown. It is either too heavy or too light, too high or too low, too long or too short, too fast or too slow, or some other reason is assigned for their not liking it, simply and solely because they in their inexperience have set up an imaginary and impossible model. They forget that the horse has many objectionable features, and are surprised to find that the motor-vehicle has any, although they are aware that nothing in this world is perfect.

In a recent letter a doctor, who is a cycle rider and a man of sound sense, objects because the vehicle offered him appeared so little for the money, when as a matter of fact the light weight and neat appearance are strong evidences in the vehicle's favour. The same man rides a bicycle weighing less than 25 lb. and without brakes or mud guard because of its general good features, when he could have had a great deal

more for his money by buying one made ten years ago, weighing 50 lb., having 30-in. or 32-in. wheels, mud guards, brake, coasters, etc.—double the quantity for less money. This looks like inconsistency, but the man is honest and trying to be consistent. The fault is in the mental condition in which his inexperience finds him, and it is because of such peculiar ideas that all or part of the buyers need more education along this line.

## HOUPIED'S MAGNETO-ELECTRIC IGNITION DEVICE FOR PETROLEUM-SPIRIT MOTORS.

ME. HOUPIED, of 16 Rue Royer Collard, Paris, has recently brought out a new magnetic ignition device for petroleum-spirit motors, which obviates the use of primary or secondary batteries. A view of the apparatus is given herewith, from which it will be seen that it comprises a magneto-electric machine, driven off the motor itself by a small band working on the grooved pulley *c*. In circuit with the magneto-electric machine is an interrupter, worked by a cam on the shaft of the small generator. Owing to the action of this cam contact is continually being broken, this rupture in the primary circuit to the induction coil giving a regular continuous succession of good sparks in the secondary circuit. Referring to the illustration, *b* is the permanent magnet and *d*<sup>2</sup> the stationary armature within which rotates a soft iron envelope. The two principal organs are the cam *m* on the end of the generator shaft and the interrupter *e*, the latter forming part of circuit of the primary current. Each time the cam acts on the interrupter a

rupture is caused in the primary circuit between the generator and the induction coil *A*, carried by the supports *J*. A feature of this coil is that it has no trembler. The connection between the interrupter and the wire *H* to the induction coil is made at *t* by means of a platinum point. From the coil the secondary circuit wires are connected to the terminals *R R*<sup>1</sup>, from which the wires run to the explosion chamber, where the sparking takes place. The putting in operation of the device is claimed to be very easy, a few turns of the motor fly-wheel being all that is necessary. It can also be so arranged as to provide the necessary electric spark for two or more cylinders and the current for a small incandescent lamp. The power required to run the new ignition device is very small, and in view of the certainty of its action and the small space it occupies, we are informed that, although it has only been on the market a short time, it has already met with a large adoption by motor-car builders and owners in France. As will be seen, the whole of the device is contained in a dust-proof box.

## MOTOR-CYCLE RACING IN MANCHESTER.

ON Saturday afternoon last a charity tournament took place on the ground of the Manchester Athletic Club at Fallowfield, the proceeds of the tournament being handed over to the Manchester Royal Infirmary and the Salford Royal Hospital. A very attractive programme was arranged, and every effort made to ensure success. There were in all twenty-three events, in which were included several new features. Cycle racing was prominent, of course; but there were also motor-cycle races, motor exhibitions, volunteer physical drill competitions and volunteer cycle races, a brass band contest, and tugs-of-war. During the afternoon C. G. Wridgway, the world's motor-cycle record-holder, made an attempt to break the ten miles motor record. He accomplished the distance in 18 m. 45 s., the previous record being 22 m. 11 s. Half the distance he covered in 9 m. 30½ s. Mr. J. A. Bennett rode a Phébus-Aster motor-cycle an exhibition mile, and C. G. Wridgway and D. H. Simpson engaged in a two-mile motor-cycle race. Wridgway won easily, the time being 4 m. 37 s.

The following are the results:—Two miles motor-cycle handicap: There were five entries, but only two competed, these being C. G. Wridgway, who rode a "Phébus" 2½ h.p. tricycle, and started from scratch, and D. H. Simpson, who rode a "Peugeot" of 1½ h.p. Simpson had a start of 400 yards, but Wridgway, going at a great speed, caught up to him in the third lap, and won easily by at least three-quarters of a lap. Time, 4 min. 37 sec. In the one-mile motor-cycle handicap Simpson and Wridgway were again the only competitors. Simpson had 200 yards start, but Wridgway easily got in front and won by a lap. Time, 2 m. 3 s.

## MOTOR-RACING AT BIRMINGHAM.

UNDER the auspices of the Birmingham branch of the Motor-Car Club and *Sport and Play*, a very interesting motor-cycle race meeting was held on the Aston track on Wednesday evening, in the presence of a large number of influential men interested in the motor and cycle industries, including Messrs. Harvey DuCros, jun., A. DuCros, C. Sangster (Ariel Cycle Co.), A. Eadie, R. W. Smith, C. R. Garrard, — Marples, R. F. Hall, Roland Hill, jun., W. A. Clay (Beeston Motor Co., Ltd.), A. Thomas (Motor Manufacturing Co., Ltd.), etc., etc. The weather was everything that could be desired, and in the final of the five-mile race S. F. Edge got within 10 s. of world's record. The results were as follows:—One mile motor-tricycle handicap: Heat 1—1, S. F. Edge (De Dion), scratch; 2, W. Munn (Ariel), 150 yards. Time 1 m. 53½ s.; won easily. Heat 2—1, C. Jarrott (De Dion), scratch; 2, C. Garrard (Ariel), 20 yards. Time 2 m. 14½ s.; won easily. Heat 3—1, C. G. Wridgway (Phébus Aster), scratch; 2, Bruno (Motor Manufacturing Co.), scratch. Time 2 m. 2½ s.; won by half a lap. Heat 4—1, W. Dunn (Ariel), 200 yards; 2, R. Hill (Beeston), scratch. Time 1 m. 52½ s. Final—1, S. F. Edge, scratch; 2, C. Jarrott, scratch; 3, C. G. Wridgway, scratch; 4, W. Dunn, 200 yards; 5, C. Garrard, 20 yards. Time 1 m. 51½ s.; won by inches only. Five miles motor-tricycle handicap: Heat 1—1, W. Dunn, 1,050 yards; 2, S. F. Edge, scratch; 3, J. W. Stocks, scratch. Time 8 m. 36 s. Heat 2—1, C. Jarrott, scratch; 2, C. G. Wridgway, scratch. Time 8 m. 57 s. Final—1, S. F. Edge, scratch; 2, C. Jarrott, scratch; 3, W. Dunn, 1,050 yards; 4, W. Stocks, scratch. Time 8 m. 32½ s. (ten seconds outside world's record). Edge won by a few inches—a very exciting finish. Ten miles motor-tricycle scratch race; 1, C. Jarrott; 2, S. F. Edge; 3, J. W. Stocks; 4, W. Dunn. Time 17 m. 22 s. Wridgway retired early from the race owing to a disconnected wire. Edge made the pace until half a lap from home and looked a certain winner, but his tire deflated just before entering the straight.

This was the first meeting of its kind ever held in Birmingham, and the terrific pace of the competitors caused quite a sensation amongst the spectators present.

## TO YARMOUTH BY MOTOR-CAR.

MESSRS. OLLEY & Co.'s 5-h.p. motor-car did a very successful trip to Yarmouth and back last week. With Mr. Olley as driver, a select party left Enfield at 6 o'clock on Tuesday morning, the 15th instant, and reached Chelmsford before stopping for breakfast. Thence they journeyed to Ipswich and Lowestoft, encountering some execrably loose roads *en route* and a heavy thunderstorm into the bargain. Consequently Yarmouth was not reached until late at night. Wednesday was spent in sightseeing, and, incidentally, the party discovered that the local police object to anything over four miles an hour for the dreaded motor! The return journey was commenced at 6 o'clock on Thursday morning. At Ipswich, Colchester, and Chelmsford, halts accounted for four hours; and thence the journey was completed *via* Ongar and Epping, arriving home, after a delightful ride, at 8 p.m.

## A SCORCHING MOTOR TRICYCLIST.

AT Ashford last week, Ernest Sinclair, of Kennington Road, London, was fined £2 and costs (£1 3s. 6d.), for driving a motor-tricycle in the High Street, Ashford, at a rate variously estimated by witnesses at from fourteen to twenty miles an hour. The defendant said they could not judge the speed, and that the capacity of the machine was only twelve miles. Notice of appeal was given.

## AN ASSAULT CASE AT DOVER.

MURRAY WATERER was summoned at Dover last week by W. Claringbould, conductor to the St. Margaret's motor-bus, for assaulting him on July 28th, at St. Margaret's. Troward Spanton was summoned by Edward Akhurst for using obscene language, and for disorderly conduct. There were cross summonses against Akhurst and Claringbould for using obscene language.

Mr. J. Harris Stone, instructed by Messrs Stilwell & Harby, appeared for the Motor-Bus Company employes, and Mr. A. Gill, instructed by Mr. A. E. Aldington, appeared for Messrs. Spanton and Waterer.

Mr. Stone, in opening for the prosecution, said the charges were the outcome of an attempt to stop the introduction of automobiles. The defendant had obstructed on several occasions, and the case was taken to protect the public from such things, which were a danger to efficient driving.

Mr. Gill objected to this statement as not referring to the case.

William Claringbould, licensed conductor, in the employ of the East Kent Motor 'Bus Co., of 57 High Street, said on Friday, July 28th, they arrived in the 'bus at St. Margaret's at 8.14 p.m. At the shed he noticed Waterer and Spanton driving furiously in a cart following the motor-car. He got off the car and went inside the car shed. When there he heard a commotion outside, so he went out, and heard Waterer say to Akhurst that he was like the stinking little secretary, getting 18s. a week. Then Spanton, who was swearing, said to Akhurst, "Come out in the meadow and have ten rounds for £5." Akhurst did not then answer. Witness said nothing. There was a crowd of people there then. Mr. Bettridge then came and one of the prisoners took him by the arm and shook him. Waterer then came to witness, and, striking him on the left side with his right hand, said, "This saucy little — was on behind." The blow made witness's lip bleed. He had not said a word to either of the defendants then. He had seen them before, but only knew Mr. Spanton. Before Waterer struck witness he told Akhurst to come away when Spanton was challenging him. Waterer, when in the cart, backed the cart into the 'bus, though he had the road to get by in. They stopped there a quarter of an hour, though the road was free, as the 'bus was inside the private ground of the shed. Both defendants were the worse for drink.

Cross-examined: He did not know that the defendant Waterer bore any ill-will. Akhurst did not use bad language. When Akhurst answered the challenge he was standing his ground, and said, "You hit me!" When getting the car into the shed, the road being narrow, they sometimes had to back more than once, but not so much as seven times. The car shed was on the Old Norman Road. They always waited till the road was clear, and never had any complaints. On this occasion the horse was restive and sweating. There was plenty of room to pass. When pulled up the horse began to rear, and a stout man came out and held it. He was in the shed at the beginning of the row. He did not hear Mr. Spanton call out "Move, and let me pass." Akhurst did not in witness's hearing say he could "— well wait." When he came out of the shed he did not hear the driver say he had been stopped before. He believed Waterer and Spanton stopped there a quarter of an hour simply to have an argument. He did not hear Mr. Bettridge say "It's no use talking to you, you're the worse for drink." The first he saw of Mr. Bettridge was when he was walking away. He never heard Akhurst use any bad language, nor did he go up to Mr. Waterer and say "You're the — who lost his watch at Folkestone." He never said anything at all to Mr. Waterer, nor did he say anything when struck.

By Mr. Stone: There was no reason why they should not have driven past.

Edward Akhurst, of Southampton, instructor in automobile driving, said he had had experience all over England. On July 28th he was with the 'bus, instructing the driver. When they got to St. Margaret's he saw the trap with Waterer in it alone, and holding the reins up high so as to show the horse was not afraid of the car. Afterwards he saw them following the 'bus at a good pace. As they on the 'bus turned the corner into the road to the shed one of them called out "Hi! Hi! where are you going with that — thing?" At the 'bus shed witness saw it backed into the shed; this was done in two minutes, but the defendants would not drive on. Then Mr. Bettridge asked them to go by, and said, "I don't want any more conversation with you, I am not drunk." They then got down and shook Mr. Bettridge, who ran away. Witness was there then, and Spanton said "Take your — 'bus away; you are like your stinking little secretary, getting 18s. a week." He kept repeating the same words. I told him to go back to the "Red Lion." He then said, "Do you know who I am? I am a County Councillor." He got in the cart again and flicked the whip on my face and challenged me to fight ten rounds for £5. Waterer then went up to the boy and struck him in the face; he tried to do it again, but some of the convalescents from Morley House held him back. A crowd was there and cried "Shame!" Both men were the worse for drink.

Cross-examined: There were generally people to see the 'bus back in. This was not because there was any difficulty, but because of the novelty. The only thing witness said was "Don't call me a —." It was a fact they had to back the car because of the narrowness of the road. The shed was just at the corner. Sometimes they had to go by the gate more than once to do this. The horse was not rearing, and he saw it all the time. A man held the horse, but that was because the men got out of the trap. When defendants caught the car up neither called out "Let me pass," and witness did not tell them to "— well wait." Witness heard what occurred between defendants and Bettridge; what he had said before was correct. He heard both defendants also brawling out "Go and fetch a doctor." Witness did not hear Claringbould say anything about the

watch at Folkestone races. Witness was close by, and would have heard. Asked as to some people who saw the row, witness said there were several witness called who were nowhere near.

Mr. Gill said he would call them in to be identified.

Henry George Curling was called, and witness said he could say on oath that he was not there during the row, as witness saw him come out of the public-house when he was going for the police.

Alfred Nilus Dowle, formerly at the South Foreland lighthouse, and now of Ramsgate, one of Marconi's wireless telegraphists, said that between the Red Lion public house and Drews' public-house he saw the defendants, between 7.30 and 8, driving down the High Street at a furious pace, and he and his family had to get out of the way. Afterwards he saw them drive back the same way, and later he saw them again driving towards the 'bus shed shortly after the bus had passed. The road at the corner was clear. Later he met Mr. Bettridge running, and the first thing he heard was Spanton saying, "We have frightened your secretary and we'll frighten you." The driver of the car was making several attempts to back in. The horse was then plunging about and was held by one of the crowd. He heard Spanton use bad language and challenge and threaten Akhurst, who replied to the threats, "Oh, will you?" He saw Waterer strike Claringbould, who was at the door of the shed. Witness then went up to protect the boy. The defendants were the worse for drink. There was no room to pass, but in two minutes there was. He did not see Waterer held back by anybody after he struck the boy. He heard the boy after being struck say, "I know you, you are the man who lost your watch at Folkestone races." This was all he said.

Henry Shoulders, a coastguardsman stationed at St. Margaret's, said he heard Spanton use bad language and challenge Akhurst. He saw Waterer assault the boy, but neither the boy nor driver used bad language. The car was partly across the road when he got there.

George Stephen Vaughan, a carpenter from St. Margaret's, corroborated as to the assault by Waterer on the boy. Several people then took the boy's part.

William Thomas Gillings corroborated as to the alleged furious driving. When the 'bus got to the shed he saw both Waterer and Spanton shake Mr. Bettridge. He heard Spanton use the bad language and challenge Akhurst, and also saw the assault by Waterer. He did not hear a word of provocation.

Police-Constable Saunders said he saw blood on the boy's face.

John Jackson Bettridge said he was secretary and manager of the Motor-Bus Co. On July 28th he met the 'bus at the "Red Lion," and rode to the door of the car shed, where he jumped down to open the door. Witness saw the defendants in a cart behind, so he ordered the car to back in as quickly as possible. The car stopped half in the shed, and then Mr. Waterer jumped down. Witness told him there was plenty of room to pass. He argued with witness, who then said, "I am not intoxicated if you are." Spanton then got down and stated that if he said they were drunk let a doctor be fetched. To smooth matters over witness apologised, and said all he wanted was for them to pass. He went away after apologising, as he thought if he did so no trouble would be caused.

Cross-examined: When the cart caught them up first they could have passed, but when they stopped he at once gave orders to back the car into the shed so as to let them pass. They did not back right into the shed, but on to the company's ground in front, which is 14 ft. 6 in. by 50 ft. The length of the 'bus is 19 ft. 6 in.

Recalled: No complaints had been received as to stoppages of traffic when entering the shed. The drivers' general instructions were to be most civil.

This concluded the evidence for the prosecution.

Mr. Gill then addressed the Bench, and dealt mainly with the imputation of drunkenness on his client, which he considered had not been sustained, and was absolutely without foundation. It was suggested that they were lying in wait for the 'bus, but this was a pure figment of imagination.

Murray Waterer said he was a farmer at St. Margaret's. He drove over to Deal on July 28th with Mr. Spanton. The horse, his own, was a spirited animal, and very difficult to drive. They got back to St. Margaret's about 8, and when driving to his farm were stopped by the 'bus. There was no room to pass and he shouted to them. Akhurst called out, "You must — well wait." He got down and told Mr. Bettridge there was no room. He said they were drunk, but afterwards begged witness's pardon and walked away. Akhurst said to witness, "You are a pair of drunken —." The car was then about six feet on to the road. Then commenced a "general swearing," but he denied swearing. The boy came up and said "You are the beautiful — that lost your watch at Folkestone races." Witness pushed him aside, but did not strike him. Witness was farming land for the Earl of Mexborough.

Toward Spanton, Whitfield, denied being drunk or that he was trying to pick a quarrel with the motor-bus people. He corroborated Mr. Waterer's evidence. In consequence of the obstruction and annoyance, he swore at the driver after the latter had sworn. He admitted offering to give the driver a good hiding.

James Williams, coachman at Mill Bottom, St. Margaret's-at-Cliffe, corroborated as to obstruction by the car. Both sides swore at one another. He did not see Mr. Waterer assault the boy. Both Mr. Spanton and Mr. Waterer were sober.

By Mr. Store: His father was bailiff to Mr. Waterer.

Henry George Curling, jun., said Mr. Spanton and Mr. Waterer were in the same condition as in court. He heard swearing on both sides at the car shed. The boy cheeked Waterer, who then pushed him away.

James Williams, bailiff to Mr. Waterer, said at 8.30 they were all right—quite sober.

The Bench, after retiring to consider the case, decided that the charge of assault against Waterer was proved, and fined him 10s. and £3 16s. 6d. costs. In reference to the other charges, the evidence was extremely conflicting, and not a single witness had not either contradicted himself or someone else. These charges on each side would therefore be dismissed. The Bench were of opinion that this case should have been settled out of Court.

Mr. Stone said that his side had not been approached.

The Chairman: Then my remarks may convey the reproach that no approach should have been made.—*Dover Express*.

## THE SPEED OF MOTOR-CARS.

WILLIAM DOWNIE, a motor-car driver, living in Sunnybank Place, was charged before Bailie Pollard in Edinburgh City Police-Court last week with driving a motor-car in a furious and reckless manner in Regent Road and London Road on the 22nd ult. He pleaded not guilty. Robert Sutherland, a constable, said that when on duty in Regent Road he observed the motor-car, which was one of the Edinburgh Autocar Company's, travelling between Edinburgh and Portobello, coming from Edinburgh at a very furious rate—about twelve or fifteen miles per hour. Being Saturday night the streets were very crowded at the time. He had cautioned accused once or twice about the rate of speed he drove at. Cross-examined: Witness admitted that he did not charge the accused until thirty-five minutes later, when he was coming down from Edinburgh again, but explained that he could not stop him at the time, being some little distance away. David Blair, another constable, and Finlay Sutherland, a tramway inspector, corroborated. For the defence, Mr. John Love, the manager of the Autocar Company, said their drivers received instructions not to go more than third speed, which was eight miles per hour. It was impossible for the car to go more than ten miles per hour, as it was only geared to that. Cross-examined by the prosecutor, witness admitted that in the hands of a novice, going down hill, it might go faster. If it did go more than ten miles per hour, however, it would shake the engine to pieces within fifty yards, and was therefore highly dangerous. Bailie Pollard pointed out that the car had gone to Portobello, returned to the Post Office, and was on its way back, a distance of at least six miles within thirty-five minutes without allowing for stoppages. Accused in his evidence said he had his brakes on going down the incline, and it was impossible under the circumstances to go more than eight miles an hour. Notwithstanding this Bailie Pollard chose to take the evidence of the policemen, and imposed a penalty of £2 with the option of seven days' imprisonment on the driver of the motor.

## AN IRREPRESSIBLE MOTOR-CAR "SCORCHER."

THREE summonses were heard at the Liverpool Police-Court on Thursday last week against a French boy, named Maurice Gildart, for having, on the 11th inst., driven his motor-cycle at three different periods of the day, at three separate points in the neighbourhood of Sefton Park, in such a manner as to endanger the life and limb of the public. The same defendant has been repeatedly before the court for similar offences and only two days before was fined 40s. and costs on each of two informations for reckless riding. The first case heard on this occasion referred to a "terribly excessive" rate of speed in Mossley Hill Drive on the morning of the 11th inst.; the second offence was committed shortly after noon on the same day in Aigburth Drive, where it was stated he was travelling at a "terrific pace," going very much faster than an electric tramcar; and the third case of serious "scorching" occurred about 11 o'clock on the same night in Lark Lane, where there was a considerable number of pedestrians. Mr. Watkins, who again appeared for the defendant, said his client did not come to court because, being French, he did not understand English. Mr. Watkins acknowledged that it was useless to attempt to justify or explain away the action of the boy, who had been previously fined five times for a similar offence, the penalties, of course, having to be paid by his employers. He (the defendant) was a skilful rider, but in view of the circumstances his employers had been compelled to take away the motor-cycle from him and lock it up, so as to avoid any repetition of the offence. The Bench imposed a penalty of 40s. and costs in each of the three cases—a total of £6 4s. 6d.

## MOTOR-CAR DRIVER FINED AT LOWESTOFT.

At Lowestoft Police-Court on Thursday last week Wm. R. Youngs, motor-car driver, Lowestoft, was summoned for driving a motor-car contrary to the Act in Cliff Road, Lowestoft, on August 11th. Defendant pleaded not guilty. P.-c. Chas. Read deposed to defendant travelling at twelve or thirteen miles per miles, causing his wheels to skid on to a jingle wheel. Defendant straightened his motor, and dashed away at the same speed. Witness had also received complaints about the defendant's rapid driving on the previous day. Henry Kenn and Arthur Boulron, jingle drivers, corroborated. Defendant said he drove his car very carefully; he had regard to the safety of his passengers and also of his car, which cost him £400. The extreme speed of his car was twelve miles per hour, and it was impossible to turn a corner at that speed, as was alleged by the witnesses. He denied having run into a horse. The Bench having retired for some time, the Mayor said the Bench did not want to be hard on motor-cars, or to show any apparent prejudice against them. They proposed to take a lenient view of the case, as it was the first prosecution, and imposed a fine of 10s 6d., or seven days.

## SALES, WANTS, Etc.

[All Advertisements under this heading will be inserted at the minimum rate of 1s. 6d. for 18 words and thereafter at the rate of 1d. per word per insertion, but on no account will any Advertisement be inserted unless prepaid.]

TRICYCLE FOR SALE at a low figure. Practically new and latest pattern; genuine De Dion throughout; with all accessories; can be seen in London.—Box 72, *Motor-Car Journal*, 39-40 Shoe Lane, London, E.C.

WORKS FOR SALE.—Modern plant. Promoters note: Purchase in cash or shares.—"Engineer," 58 Waterlow Road South, Wolverhampton.

ELECTRICAL ENGINEER seeks Situation. Thoroughly experienced in motor-cars.—Apply Box 83, *Motor-Car Journal*, 39-40 Shoe Lane, London, E.C.

DAIMLER MOTOR-WAGONETTE, 5½ h.p., grand carriage, in perfect condition, new tires, re painted and upholstered, to carry four or six, free trials to buyers.—Apply Frank F. Wellington, 36 St. George's Square, Regent's Park, N.W.

MOTOR-WAGONETTE by Daimler, 5½ h.p., to carry eight passengers beside driver, geared low for hill climbing, suitable for seaside resort, in grand condition, almost new, free trials to buyers; price £275.—Apply Frank F. Wellington, 36 St. George's Square, Regent's Park, N.W.

THREE MOTOR DELIVERY VANS.—Could be made into wagonettes; in good condition; to be sold at ridiculously low price to make room for new carriages.—Can be seen at Frank F. Wellington's, 36 St. George's Square, Regent's Park, N.W.

BENZ INTERNATIONAL SOCIABLE CARRIAGE, to carry three, beautifully upholstered, very powerful, with all latest improvements; price £125.—Apply Frank F. Wellington, 36 St. George's Square, Regent's Park, N.W.

GENUINE DE DION QUADRICYCLE, interchangeable to Tricycle, very little used, exceptional bargain, in grand running order, price £65; De Dion Tricycle, 1½ h.p., fitted with front attachment if required, in grand order, price £45; De Dion Tricycle, 1½ h.p., really fine machine, good goer, price £35; De Dion Tricycle, 1 h.p., splendid running machine, price £30; Two Bollées in grand working order, to be sold cheap; also two Werner Bicycles, £20 each.—Apply Frank F. Wellington, 36 St. George's Square, Regent's Park, N.W.

BACK NUMBERS "MOTOR-CAR JOURNAL."—Numbers 1 and 4 are out of print. Of other back numbers we have but a few left. Those desirous of completing their files should make immediate application for missing copies. Usual price, 1d.; post free 1½d., or through any news-agent.—Cordingley & Co., Proprietors, 39-40 Shoe Lane, E.C.

MORS DOG-CART FOR SALE.—Silent, in perfect condition, just been overhauled, and back wheels fitted with Continental tires; spare oil tank and luncheon basket; photo.—36 Highfield Road, Edgbaston, Birmingham.

SHARES FOR SALE.—500 ss. paid and 100 fully-paid Shares in Stirling's Motor-Carriages, Limited. Will sell at par, including present year's dividend.—Box No. 35, *Motor-Car Journal*, 39-40 Shoe Lane, London, E.C.

BENZ CAR FOR SALE.—3 h.p.; Connolly's tires, Brampton's chains; bought new at Hewetson's this year; thoroughly reliable; very little used; can have a hundred miles trial before purchasing; immediate cash, £115; going in for larger car.—E. W. Foster, Victoria House, Southchurch Road, Southend-on-Sea.

COVENTRY MOTETTE FOR SALE.—3½-in. cylinder; in splendid condition and good working order.—Grose, Limited, Northampton.

WANTED ALL KINDS OF FITTINGS AND WHEELS FOR BENZ MOTORS, in quantities.—Apply Box 59, *Motor-Car Journal*, 39-40 Shoe Lane, London, E.C.

DRIVER WANTED.—Must have had experience with Daimler motors; abstainer; good reference.—Matthew & Langley, Park Square, Luton, Beds.

MOTOR-CAR DRIVERS WANTED.—Must be experienced and of good character. Write stating wages expected to Box 24, *Motor-Car Journal* Office, 39-40, Shoe Lane, London, E.C.

## Trade Announcements.

[All Advertisements under this heading will be inserted at the minimum rate of 2s. 6d. for 30 words and thereafter at the rate of 1d. per word per insertion, but on no account will any Advertisement be inserted unless prepaid.]

PLATINUM.—Used Ignition Tubes Wanted, and Platinum Scrap of all kinds Purchased; best prices by Derby & Co., 44 Clerkenwell Road, London, E.C. Established 1797. 24

MOTORS ON HIRE.—Daimlers, Panhards, Benz, New Beestons, etc., in good order, by day, week, or month.—The Yorkshire Motor-Car Co., Ltd., Bradford.

## TO CORRESPONDENTS.

All communications intended for insertion in this Journal or relating to Editorial matters should be addressed to THE EDITORIAL DEPARTMENT, MOTOR-CAR JOURNAL, 39 and 40 Shoe Lane, London, E.C. Letters must in all cases be accompanied by the name and address of the writer, as no notice will be taken of anonymous communications.

The Editors cannot undertake to return MSS. or drawings, although every effort will be made to do so in the case of rejected communications. Where such are regarded as of value, correspondents are requested to retain copies.

The Editors do not hold themselves responsible for the opinions expressed by their correspondents, or for statements and facts which do not appear in the editorial columns.

The Editors and Publishers beg also to state that they will accept no responsibility for unsolicited contributions, even if used, unless payment for same is directly specified in forwarding, and the terms arranged before publication.

To insure insertion communications and contributions must be in the Editors' hands by Wednesday forenoon of the week in which the same are intended to appear. Disappointment may be caused by non-compliance with this rule, and to avoid this earlier receipt, if possible, is necessary.

## COMMENTS.

### Motor-Cars in the Isle of Man.

The first of a number of motor-cars which are intended to run in conformity with a recent Act of the Manx Legislature to various towns and pleasure resorts in the Isle of Man arrived at Douglas on Wednesday last week. It is handsomely constructed, of *chars-a-banc* type, is on the Daimler-Panhard principle, and carries eight passengers and a driver. The same day the car, which ran smoothly and satisfactorily, was taken to Peel, a distance of ten miles, in just over an hour, doing the return journey five minutes under the hour. The newcomer was eyed with curiosity by a tremendous crowd at Peel, and met with an enthusiastic reception. The car has been built by the Motor Manufacturing Co., Ltd., of Holborn Viaduct, E.C., and Coventry, to the order of the Manx Cycle and Motor Co., Ltd., Douglas.

### The Trans-American Automobile Tour.

We have already referred to the trip of Mr. and Mrs. Davis in a motor-car from New York to San Francisco and to the poor results so far achieved. The latest accounts to hand show that the tour is still proving a dismal failure. Thus, the *Horseless Age* remarks: "The adventurous couple who are endeavouring to make 'San Francisco or bust' in a motor-carriage have apparently taken the latter alternative. At the rate at which they are travelling they could not reach San Francisco in less than five months from the date of setting out, and at the rate at which they are 'busting' they would have an entirely different carriage if they ever reached the Pacific Coast. If the unfortunate experiences of this couple shall do anything to discourage similar enterprises in the future their troubles will not have been wholly in vain. An immediate termination of the journey would be welcomed by the motor-vehicle industry of the United States."

### The Function of the Horse.

OUR good friend the *Electrical Review* has joined the prophets of melancholy things, and while recognising that "the motor-vehicle industry is now fairly established, and that very soon considerable numbers of vehicles will be seen at work," is, nevertheless, rather doleful, for "we also anticipate a considerable crop of very serious accidents. Without a horse in front to push a person out of the way these heavy motor-vehicles have their leading wheels well thrust out in front and absolutely devoid of safeguards of any sort." We did not know that the function of the horse between shafts was to push people out of its way as well as to draw the vehicle. Apparently, therefore, when a man, woman, or child is knocked down by a horse it must be accounted to the animal for playfulness, and merely indicate a desire to remove obstacles. Really we are surprised that the *Electrical Review* has not developed the idea and suggested that a rod resembling the barber's pole should be attached in front of motor-vehicles, with others hung out sideways, to clear a passage for the vehicle. Our contemporary has nothing against the motor-car as such, but it is sorely afraid

that without a horse to push people out of the way accidents will happen. Well, so thought the Editor of the *Stable and Kennel* when he saw a motor-car near his street; but, up to now, no damage has been reported in the locality.

### "Rely on the Police."

REALLY we are sorry to have to expostulate with the Editor of the *Stable* again, for after his recent kindlier tone we had thought he had begun to realise it was no use declaiming against the inevitable. And yet in his last week's issue the dear good man actually suggests that the declaration of a policeman to the effect that the pace of a motor-car endangered the public should be sufficient to secure conviction. This seems a laborious way of getting over the difficulty. Why not make it a criminal act to mount a motor-car? A penalty of six months imprisonment for such an offence should satisfy even so persistent an enemy as the Editor who discourses of the stable. When he wants a little relief from such monotony he should try a trip on a motor-car. The fresh air would revive his spirits.

### Horses and Tramcars.

THOSE who are afraid that the "noble horse" will not often be seen in the streets of London in the early days of the coming century may take comfort in the fact that the motor-car is not likely to entirely supersede the horse in Metropolitan thoroughfares till after the year 1999, so that the matter can hardly be regarded as coming within the view of current events. Despite the great advance lately made by electric traction, some 40,000 horses still find employment in hauling tramways, thus demonstrating how slowly changes are effected. Even the Glasgow Corporation tramways, which are largely operated by electricity, still find work for 4,267 quadrupeds.

### Junior Engineers and Motor-Cars.

ONE of the pleasantest trips enjoyed by the Institution of Junior Engineers during their recent summer meeting at Portsmouth was that to the works of the Liquid Fuel Engineering Co. at East Cowes. Under the guidance of Mr. Tousey, the party was shown over the establishment, which employs about 200 workmen and has a capacity for the construction of thirty "Lifu" steam wagons and twenty launches annually, among the orders now in hand being four steam omnibuses for Toulon. After the inspection of works, some of the Junior Engineers were driven to Whippingham in "Lifu" motor-cars, while others saw a demonstration of the working of the Company's steam launches.

### Motor-Cars on Teeside.

TYNESIDE having proved kindly to the motor-car services that have been provided, the Tees-side district is now to be similarly favoured and orders have been placed with the Daimler Motor Company, Limited, for eight cars with a seating accommodation of ten passengers each. The proposed services are from Stockton and Middlesbrough

to various suburbs, and it is contemplated to develop the scheme until Thornaby, Redcar, Saltburn, Darlington and the Hartlepoons are similarly served. Show rooms and repairing shops will be established at Middlesbrough and Redcar, and the plans of the North York and South Durham Motor-Car and Bungalow Syndicate, Limited, also include the letting of vehicles to tradesmen by the day, as well as catering for the public. Mr. D. Anderson, of Collingwood Street, Newcastle-on-Tyne, is at the head of the undertaking, Mr. J. L. Gribbin, a Middlesbrough solicitor, being also interested in the venture.

**A Chester Journalist behind the Times.**

"THE Duke of Westminster is long-suffering, but will he tolerate the motor-carriage?" Such is the momentous question propounded by the highly decorous *Chester Chronicle* last week.

It appears a member of the editorial staff was walking in the Duke's park and "met a motor-carriage with two men on the box and three or four ladies inside." The men were driving cautiously; they continually sounded the horn and "were everything that could be desired." So that there was nothing to say against the drivers, "but the motor-carriage was such an unusual object that horses would not face it." In fact, one horse was so alarmed that he "would have run into the wood but for the trees." What he would have done in the wood had the trees not been there we leave this Chester scribe to picture; but we are glad the trees stopped his course in that direction. Evidently our journalistic brother does not know that the Duke of Westminster attended the Motor-Car Exhibition at the Agricultural Hall and ordered a motor-car, which will undoubtedly be seen in the park at Chester, thus testifying to the encouragement of automobilism by a gentleman who is famous as a lover of horses. We agree with the *Chester Chronicle* that new regulations may be necessary in the ducal grounds, but would suggest that they should apply to the driving of horses by competent drivers and the education of

AN EARLY STEAM TRACTOR.—MR. LOFTUS PERKINS' VEHICLE, BUILT ABOUT 1870.

such animals (the horses we mean) to look without alarm on the Duke's motor-car and not to attempt to run into other people's woods. Again we must express pleasure that the trees prevented that rude horse entering the wood.

**Motor-Cars and the Boscombe Carnival.**

MOTOR-CARS were very much *en evidence* at the Boscombe carnival, which took place on Wednesday last week, no less than four decorated automobile vehicles taking part in the procession. Prominent among them

was the electrically-propelled bath chair, fitted with a Britannia motor and Sherrin accumulators driven by Master

Douglas Armstrong, the electrical engineer-in-charge, a young gentleman of only eight summers, with Miss Eileen Armstrong, aged six, as a passenger. This was the same chair—in fact, the identical juvenile driver—which attracted so much attention at the recent Exhibition at the Agricultural Hall, Islington. The Armstrong electric parcels carrier, fitted with Britannia motor and Crowds accumulators, was also on view in the trade tableaux class. The exhibition of these vehicles was due to Mr. Jas. Shepherd, of 15 Somerset Place, Boscombe, who we may mention has secured the agency for the same in that district. Another vehicle in the procession which attracted considerable attention was the Peugeot car owned and driven by Mr. A. W. Armstrong, of

MR. ARMSTRONG'S DECORATED PEUGEOT CAR AT THE BOSCOMBE CARNIVAL.

Hampstead, N.W. The carriage was decorated to represent "Harvest," and gained first prize for best decorated motor-cars. The decorations consisted of bunches of white and black grapes, mulberries, apples, pears, tomatoes, backed up with sheaves of corn, with poppies and marguerites intermixed, and bulrushes at the corners. For the best trade tableaux there were eight entries, the first prize being secured by Mr. C. Cowell, of the Avon Cycle Works, Boscombe, Bournemouth, who, as "King Cyclos," drove a decorated Benz car, he having four mounted cyclists on each side of his vehicle as attendants.

**Motoring and Marrying.**

MISS ELLA HEPWORTH DIXON—we must beg the lady's pardon if she is Mrs.—is a friend of the motor-car and a contributor to the *Lady's Pictorial*. In her study of the automobile she has discovered that "people in a motor-car always look more amused than people in a carriage drawn by a horse," and that although "timid elderly ladies and stout Justices of the Peace will be chary of taking up the new mode of locomotion," the motor-car has come to stay—or, she should have said, it has come to go. But in addition to these reflections Miss Dixon has studied the sociological and the matrimonial aspect of automobilism, and has come to the conclusion that "rural society will become vastly enlarged and broader-minded" as it takes to the motor-car. But that is not all: it may arrest the degenerate tendency of the species which is said to be going on, and thus prove itself one of the great influences of the modern world. In a remote part of Kent Miss Dixon has discovered that "the village folk intermarry to an alarming extent. It is only when the country-side is provided with electric omnibuses,

# The Gobron and Brillié "Silent" Motor-Car.

FIG. 1.—GENERAL VIEW OF WAGONETTE.

and intercourse is easy and frequent with other villages and towns that Hodge will discover that it is better for himself and for the race to espouse a maiden in a distant parish than his cousin and next-door neighbour." The electric omnibus will therefore be the vehicle for Cupid in the future, and the country lanes will lose their attractions for rural swains and maidens. But if all the lads are to go by motor-car to neighbouring villages, what is to become of the maidens sitting all forlorn awaiting the tooting of the automobile horn or the coming of the electric cab? But seriously, we fancy Hodge will keep at his plough and pursue his courting in his own way. If he sees a charming lass living a few hundred yards away he is more likely to make love to her than to spend his money in motoring to the next village and probably faring worse. Really, Miss Ella Hepworth Dixon is too enthusiastic on the subject of motoring and marrying.

## The British Association at Dover.

MOTOR-CARS should be prominent at the meeting of the British Association at Dover which commences on the 13th inst. Already we have recorded the proposed visit of the Automobile Club, and have chronicled the motor-car exhibition which will be held. Now we are able to announce, on the authority of the *Times*, that in the section devoted to mechanical engineering Mr. Thornycroft, of Chiswick, will read a paper on steam motor-vehicles. Every such discussion, as is certain to be evoked, should be welcomed by all interested in the progress of the "new industry"—a phrase rapidly becoming out of date.

M. CHARLES CRANINCKX, the well-known Belgian "chauffeur," who was terribly injured in a motor-car accident in July, is now rapidly recovering.

THE West London carnival was successfully held on Thursday last week in the grounds of the Godolphin Schools, Hammersmith. In the procession many well-known cyclists took part, Mr. F. G. Lewin, as "Dreyfus," mounted on a motor-tricycle, cutting a good figure.

THERE are many features of interest in the new motor-vehicle (Fig. 1) built by the Société des Moteurs Gobron and Brillié, of 17 Rue Philippe de Grand, Paris, and lately introduced into this country by the Automobile Association, Ltd., of Prince's Road, Holland Park Avenue, London, W. In our report of the Richmond Show we gave a brief description of the five-seated wagonette of this type there exhibited, which we are able to supplement with some further particulars and also illustrations of the motor and certain of the other details.

To deal first with the motor. This, as will be seen from Figs. 2 and 3, is of quite a new type, the object being to reduce vibration by arranging the parts in such a way as to secure absolute balance. In the motor, which is the design of M. E. Brillié, it will be noticed that there are two cylinders with two pistons in each (3, 4, 5 and 6, Figs. 2 and 3). The cylinders each work on what is known as the four cycle system and are connected together in such a manner as to obtain a working stroke for every revolution. The main features consist of the general arrangement of the pistons and connecting-rods so as to prevent disturbances by the inertia of the parts when the engine is in motion, and in an arrangement of pump whereby the burnt gases are cleared out and air supplied for mixing with and pulverising the oil when a liquid hydrocarbon is employed. The cylinders of each pair are in line with each other, the pistons of each pair moving in opposite directions. The pistons of the lower cylinders 5 and 6 of each pair drive the shaft direct by means of connecting-rods working on a crank 14 on the shaft and the pistons of the other two cylinders 3 and 4 drive the shaft indirectly by means of a swivelling cross-head 11 connected to the two pistons and having its ends connected by links or pitmen to two cranks 13 and 15 set at 180° to the preceding ones. The radius or throw of the crank 14 to which the lower pistons are connected is greater than that of the cranks 13 and 15 to compensate for the extra weight presented by the indirect connection of the pistons with the shaft. The inlets 11 for the combustible mixture to, and for the exhaust of the burnt gases from, the cylinders, are situated between the cylinders of each pair. The inlet valves communicate with

a chamber in which opens a valve for the inlet of air, a passage conveying the gas or oil and a passage opening into an air pump also leading into this same chamber. All the valves are operated by cams mounted on counter-shafts which rotate so as to operate the valves at the requisite times. An air pump cylinder is set at or about an angle of  $45^\circ$  to the working cylinders, its piston being driven by a connecting

FIGS. 2 & 3.—SECTION ELEVATIONS OF MOTOR.

rod from the crank of the motor-shaft. The air passage above referred to opens into the air pump cylinder, and at the proper time is closed by the piston of the air pump. Into the air pump cylinder also opens an orifice which at a given moment can be placed in communication with the interior of the cylinder by a passage formed in the piston of the air pump.

FIGS. 4, 5 & 6.—SECTIONAL VIEWS OF CARBURETTING DEVICE.

The cylinder is also provided with an inlet or supply valve for air, the orifice being connected with a pipe leading to a petroleum pulverizer for supplying air to and pulverizing the charge. As the motor-shaft rotates the lower pistons 5 and 6 are moved in the opposite direction to the upper pistons 3 and 4, and as the latter have a higher speed than the former by reason of the difference in the throw of the cranks, the strains due to inertia from the upper pistons and links or

pitmen are therefore compensated for. The piston of the air pump draws in at every revolution a certain quantity of air while at the same time a valve shuts off communication with the atmosphere. At this moment exhaust takes place in one or the other cylinder (while there is compression in the other). The valve of the cylinder which is exhausting is raised by its cam allowing a free passage for the air which expels the gases contained between the two pistons. At the close of the period of exhaust, that is to say at the end of the converging of the pistons, the piston of the air cylinder continuing its course stops the passage of air to clear out the exhaust and then compresses the air which at the proper time passes by a passage through the piston to mix with the oil so that the explosive mixture enters the chamber between the inlet valves to the combustion chambers just as one of the cylinders starts drawing in a charge.

In the wagonette in question the motor is of 6 h.p., at a normal speed of 700 revolutions per minute. The latter, however, can be varied from 250 to 1,000 revolutions. The cylinders are water-jacketed, while the ignition is electrical.

FIG. 7.—DETAILS OF STEERING GEAR.

Only one induction coil is employed, the spark being obtained alternately in each cylinder by means of an automatic commutator arranged in the secondary circuit. The water tank has a capacity of about four gallons, the heated water being passed through a condensing coil in front by means of a small plunger pump ere it returns to the tank.

In place of the ordinary form of carburettor, Messrs. Gobron & Brillié employ what they term a mechanically-operated volumetrical distributor, which measures exactly and automatically the volume of petrol required for each explosion, the mixture of the same with air taking place in the suction pipe. The details of the apparatus are shown in Figs. 4, 5, and 6 (Fig. 5 being a section through the line A B and Fig. 6 a section at C D). The distributor proper consists of a conical plug, which has formed on its outside face a series of equi-distant grooves. This plug turns and is held by a spring 3, in a seating 2 in communication with the petrol storage tank. A circular space formed in the seating 2 permits the petrol to pass freely into the grooves in the plug. At 6 and 7 converge two

pipes, the one 6 being the air inlet, the other 7 leading to the inlet valves of the cylinders. Externally the plug 1 is actuated by a small shaft carrying a ratchet wheel having the same number of teeth as there are grooves in the plug. The ratchet wheel is operated by the pawl 8; a governor acting on the lever 21 controls this pawl, the latter being so arranged that it can be prevented from operating the ratchet wheel and consequently the plug 1. The rotation of the latter being in the direction of the arrow, it will be seen that at the moment that one of the grooves of the plug 1, full of petrol, comes in front of the inlets to the pipes 6 and 7 the aspiration stroke of the motor will draw in a charge of air along the pipe 6, which air passing into the pipe 7 will draw with it the petrol in the groove of the plug. The petrol is pulverised by means of a screen in the pipe 7, and is afterwards mixed with fresh air entering by the pipe 12. The amount of air allowed to pass through the pipe 12 is regulated at 14 in such a way that at the moment of exhaust a reduction takes place in the pressure in the chamber 15, so as to give rise to a sufficient in-draught of air by the pipes 6 and 7. The petrol from the storage tank passes into the distributor by the pipe 16. At 17 a small chimney is provided which permits any globules of air in the distributor to escape.

The governor controlling the lever 21 comprises a lever 22 (Fig. 4), which receives its oscillating motion from a cam or eccentric on the motor-shaft 23. A weight 24 loosely

FIG. 8.—DETAILS OF STEERING GEAR.

mounted on the shaft 25 of the lever 22 is moved during the oscillation of the lever, by a projection 26 which extends through a hole in the lever 22. The weight 24 is held by a spring 27, of which the tension may be varied by means of the hand lever 29, placed within easy reach of the driver. On the lever 22 is a tappet 32, pivoted at 33; it is controlled by a small spring, which tends to keep the upper part of the tappets in contact with the projection 26. The other end of the tappet 34 is arranged so that it can push the point of a lever 35, pivoted at 25, the movement of which controls the rod 21. So long as the spring 27 maintains the contact between the projection 26 of the lever 22, the oscillation of the latter is transmitted integrally to all the organs of the governor, and at each revolution the rod 21 is lifted, allowing a charge of spirit to pass into the pipe 7. Should the speed tend to rise above the normal, the effort of inertia of the weight 24 will increase, and by means of the projection 26 the tappet 32 will move on its axis so that its end 34 will clear, and so not lift, the lever 35, consequently cutting off the supply of petrol. The tension on the spring and the speed of the motor can be varied as desired by placing the lever 29 in one or other of the notches in the sector 31, the motor being brought to a standstill by placing the lever in the extreme notch 30. It is claimed for the device that it ensures a constant supply of petrol for each impulse, and that it gives a regular mixture independent of atmospheric conditions and of the driver.

Another feature of the car is to be found in the steering gear, which is arranged to give a variable multiplication of the ratio of movement between the steering hand-wheel and the front road wheels. This device, by means of which not only can turns, it is claimed, be made with but little movement of the hand wheel, but on straight roads the hand wheel can be left free without any deviation of the front wheels taking place, is shown in Figs. 7 and 8. The hand wheel *V* is rigidly fixed to the upper end of the vertical shaft *A A'*, within the hollow standard *T*; to the end of the latter is fixed a small pinion *K*. The lower end of the vertical shaft *A A'* carries an arm or lever *L*, terminating in a hollow piece which serves as a bearing for the shaft *D D* parallel to *A A'*; to the upper end of *D* is fixed a toothed sector *S*, which gears with the pinion *K*. To the lower end of the shaft *D* is connected a crank arm *M*, controlling the steering lever on the piece *C*. The spring *R* serves to tend to maintain in the same vertical plane the three shafts *A C D*. If a movement of rotation is given to the hand wheel *V* the shaft *D* will move in a circle round *A*. The sector *S* gearing with the fixed pinion *K*, all parts in rigid connection with *S*, and in particular the piece *C* of the crank *M*, will be given an epicycloidal motion. A diagram of the relative displacement of the front road wheels to that of the hand wheel is given in Fig. 8. As the hand wheel is turned to the right or left the point *C* will describe one of the curves *C<sub>0</sub> C<sub>1</sub> C<sub>2</sub> C<sub>3</sub>*. In fact, as the hand wheel is turned to the successive positions 1, 2, 3 to 9, the point *C* will occupy successively the corresponding positions *C<sub>0</sub> C<sub>1</sub> C<sub>2</sub> to C<sub>8</sub> C<sub>9</sub>*, the space between which progressively increases; thus for an equal displacement of the hand wheel, either to the left or right, the angle of deviation of the road wheels becomes the greater the more they are turned from the straight.

The body of the car is quite distinct from and is supported by indiarubber springs on the frame which carries the motor and transmission gear. The frame is of a special design, and built up of steel tubing, well stayed. Three forward speeds (ranging up to twenty miles per hour) and one backward motion are provided. The transmission is effected by gear wheels, there being two intermediary shafts, a friction clutch being arranged on the first one, the connection between the second intermediary shaft and the rear road wheel being effected by chain gearing. In the car under notice the motor is located centrally, but Messrs. Gobron & Brillié are also building cars with the motor at the front or rear as desired. All the control levers are arranged within easy reach of the driver, the speed-varying handles being mounted on a short vertical shaft parallel to the steering standard. There are two foot pedals, one of which controls the friction clutch between the motor and transmission gear, while the other actuates a cord brake on the differential shaft. A hand brake acting on the tires is also provided. As will be seen from the foregoing description the car presents many novel features, and if the claims as to the absence of vibration can be substantiated in practice it is one which should meet with a large adoption at the hands of automobilists.

At the last meeting of the Lowestoft Town Council, a letter was received from Mr. W. R. Youngs, of the Lowestoft Motor-car Company, Limited, asking the Council to appoint stands for their motor-cars. On the recommendation of the Sanitary Committee, it was resolved that for the present the stand should be fixed to the west of the Royal Hotel, near the Royal Plain.

THE visit of Messrs. Barnum and Bailey's show to Newcastle-on-Tyne was the means of giving a large number of country persons an introduction to the motor-car. Since their arrival in Newcastle the cars have been quite unequal to the demands made upon them. Those running to Gosforth, Osborne Road, and Jesmond are always crowded, and many persons who had a prejudice against the new vehicles have had their views changed by experience.

## THE MORS CARRIAGE.—II.

By VELOX.

(Continued from page 379.)

ON the left of the driving seat, at a level with the seat itself, is placed the gear controlling the tension of the belts. This consists of a vertical rod, terminated at the top end by a crank handle. This rod actuates the tension gear through the medium of a crown and worm-wheel arrangement duplicated on the end or side of the car. The two endless screws draw forward or drive backward the bearings resting on slides and carrying the secondary shaft. These bearings are kept in perfect parallel by the synchronous movement of the two screws. By this arrangement the secondary or intermediate shaft is withdrawn further from or is driven closer to the main or driving-shaft, with the result that as these movements occur the belts carried on the pulleys of these shafts

is another handle which completes a vertical rod. This actuates the reversing gear. Two foot pedals placed on the footboard complete the control gear proper; one placed for operation by the left foot throws the motor out of gear with the transmitting mechanism, operating an ordinary type of male and female friction-clutch; the other, placed for operation by the right foot, controls the brakes, and at the same time also operates the clutch gear and throws the motor out of operation. The "devil" or "sprag" used to prevent the descent of the car when stopped on a steep hill is operated by the lever 11 shown in Fig. 1 of our illustrations (p. 378, *ante*).

Before commencing a further general description of the mechanism, we desire to again allude to the vertical handle, fixed on the left end of the handle or steering bar. At the top of the handle is a button, which is, in fact, a spring cutting out the switch, permitting the current to be cut off from the ignition gear by the mere pressure of the thumb of the left hand whilst the hand itself is manipulating the steering handles. By this device also the speed of the car can be further controlled, and in dense traffic the ability to at once stop the passage of current to the explosion chamber is of extreme advantage, as the number of successive explosions can be regulated at will.

1. Case containing the 4 self-induction coils.

2. The four tubes conveying the cooling water from the cylinder walls.

3. Enclosed crank chamber.

4. Four discs controlling the admission of explosive mixture to the four explosion chambers, and controlling the quality thereof.

5. Carburettor.

6. Hamelle automatic lubricator.

7. Articulated arms, actuated by moderator lever, and controlling the discs, admitting the explosive mixture to the cylinder.

8. Exhaust pipe communicating from the exhaust valves to the exhaust chamber.

9. Exterior view of the electric ignition or sparking device.

10. One of the four pipes conveying water to the cylinder walls.

11. High-speed pulley.

12. Low-speed pulley.

13. Dynamo for generating current.

14. Bonchon of the smaller water reservoir.

FIG. 2.—VIEW OF MOTOR AND TRANSMISSION GEAR OF MORS DOG-CART AS SEEN FROM REAR.

are tightened or slackened as the case may be. By the extreme delicacy of the adjustment it is possible to secure just that exact tension under which the motive power is best communicated.

On the steering pillar, underneath the handle bar, are two hand levers, which communicate through the medium of rods with the belt shipping devices. One handle is used to ship the belt from the loose to the fast pulley of the high speed gear, and the others to effect a similar service in regard to the low speed gear, the fast or live pulleys in both cases, of course, being carried on the secondary shaft.

Apart from the speeds obtainable by these two positive speeds, the driver has command of the whole gamut lying between and below them by manipulating the tension gear. Furthermore, he has additional power to increase or diminish his speed by a moderator controlled by a small lever working in a ratchet and placed at the driver's right hand on the outside of the car as previously mentioned. The working of this lever requires no appreciable effort, thanks to the multiplication of its movement through a series of articulated levers, and by its aid the most complete control of the speed of the car and its evolutions can be maintained.

Under the levers controlling the belt shipping device

Passing now to Fig. 2, it remains to be said that the whole of the body of the carriage can be removed at once from the frame, etc., by simply unscrewing four nuts and lifting the body *en bloc* from the frame. When this is done the illustration given in Fig. 2 gives a correct exposition of what is seen when standing at the back of the car.

This view of the mechanism gives at once a perfect conception of the whole of the mechanical organism of the car immediately at a glance. The motor, of course, first appeals to one's vision. In Fig. 2 the posterior pair of cylinders are at once seen; the front pair, however, are concealed by the first-mentioned. The cooling radiators placed round the back pair of cylinders are plainly seen, whilst it is also plain that the explosion chambers are equal in diameter to the full extent of the radiating fins owing to their envelopment by a water-jacket. Each system of heat radiation contributes its quota to the efficient cooling of the cylinders. At the end of the explosion chamber there can be seen the outwardly projecting ends of the firing device, which will be more particularly described later. The observer's first remark on examining the mechanism from this point of view is one of surprise that the motor instead of being placed centrally in the frame of the vehicle is in

effect placed at one side, the main or driving shaft having a greater length to the left hand than to the right. At first sight it would seem obviously a better arrangement to place the motor centrally, as by such means a more perfect distribution of weight would be secured.

(To be continued.)

## MOTOR-CARS ON THE CONTINENT.

(From Our Own Correspondent.)

### A Lengthy Tour.

MONSIEUR AND MADAME ALBERT GAUTIER have just returned to Nice after a highly successful automobile tour, during which they travelled no less than 3,200 kilometres. They traversed Italy and Switzerland; they

followed the course of the Rhine to its source; they visited the Vosges, Jura and Dauphiné; and yet we are informed by a certain section of the press that the automobile is not at present a reliable vehicle!

### Automobiles in Belgium.

THE legal limit of speed for automobiles when traversing any Belgian towns has now been reduced to ten kilometres per hour, and it is rumoured that the King himself has fixed this maximum. As, however, the police

regulations embodying this condition do not come into force until November next the Paris-Ostend race is in no way affected.

### Accident to Monsieur A. de Lucenski.

THE director of our French contemporary, *Le Journal des Sports*, has been singularly unfortunate this year in the matter of accidents. Quite recently his mechanician was seriously injured and his car badly damaged, and

now particulars of a further mishap are to hand. On the 24th ult. he was returning to Cabourg from the Deauville races in his automobile, accompanied by Mdme. de Lucenski and M. Charles Bertrand, a new mechanician being in charge of the car. This man in avoiding a vehicle made so sharp a turn that the car and its occupants were precipitated into a deep ravine by the road side. Fortunately the injuries sustained by the travellers were not of a serious nature, and they were able to proceed to Cabourg in a "hippomobile." The car, however, was badly damaged.

### The Automobile Clubs of France and America.

M. LE BARON DE ZUYLEN, as president of the Automobile Club of France, has received a letter from Mr. George F. Chamberlin, the temporary president of the newly-founded Automobile Club of America, in which the objects of the

new society are set out. Mr. Chamberlain requests permission to enrol the names of the president and vice-presidents of the A.C.F. as honorary members of his club, and he further expresses the desire to establish amicable relations between the two societies.

### Long Run by an Electric Car.

UNTIL a few days ago, probably the best performance on an electric car in France was that of Le Comte de Chasseloup-Laubat and M. Jeantaud, who travelled to Rouen in one day, but we have now to record a noteworthy

advance on this ride. MM. Bouquet, Garcin and Schivre

have succeeded in making the journey Paris-Caen in two days, the first stage taking them as far as Rouen. We observe that these gentlemen are competing in the tourist class of the Paris-Ostend race, and understand that they will recharge their accumulators at Saint-Pol, the termination of the first stage.

### Paris-Provins Race.

THIS "course," which is set down for decision on Sunday next, includes an entirely new category. It is one for motor-cycles actually owned by and in the personal service of the rider. This ruling therefore excludes all those

"chauffeurs" who race in the interests of manufacturers or who ride machines owned by manufacturing firms. Is not this a step towards a definite distinction between the amateur and the professional racing man?

### Fracas at the Clément Works.

LAST week at the works of M. Clément at Levallois there took place a most regrettable incident which might have resulted very seriously. A recently engaged foreman, by name Philibert Gasselien, had earned the enmity of the employés in the motor-cycle department, and on the 24th ult. they attacked him as he was entering the factory. Repeatedly struck, and fearing for his life, he drew a revolver from his pocket and fired upon his assailants, one of whom he wounded. The rest took to their heels and fled, leaving the two men upon the ground. After removal to their domiciles it was found that the wounds were not of a very serious nature.

### Stations for Cycles and Motor-Cycles.

A CORRESPONDENT of our contemporary, *Le Vélo*, has put forward a really capital idea, and which will, if adopted by the authorities, prove a perfect boon to all Parisian cyclists. His suggestion is that at all the "kiosques" and cab-

stands stations be installed for the purpose of taking care of cycles during the temporary absence of their owners. Surely the authorities will adopt this idea, against which there can be no objections, and which would be warmly welcomed by the cycling world. There is no doubt that the institution of such stations would largely increase the number of cycles in use for business purposes, as at present many people are deterred from employing their machines by the inconvenience and trouble they are put to when making a call. For example, under present conditions you set out to call upon a friend. You ride a new and expensive machine, and upon arrival you hesitate as to your course of action. Shall you leave the cycle in the street or take it inside? The *concierge* will probably object, so you decide to leave it outside, and you search for a man to take charge. Filled with misgivings, you spend half an hour in scrutinising a dozen and can trust none. You think you will take the machine inside after all! In the case of a motor-cycle much persuasion is required to induce it to mount firstly the kerb and then the step of the entrance hall. The *concierge* receives you coldly, and, noticing the muddy wheel tracks, says "things" under his breath. Your friend lives on the fourth floor, and you mount laboriously, studying meanwhile the muddy condition of your trousers due to your struggle with the machine in the hall. You reach the fourth floor. Your friend is out! You descend in a fury to find that the *concierge*, enraged at the mud and a lake of lubricating oil in his hall, is endeavouring to stick pins through your tires. Finally you bump the cycle back into the street, and catch sight of your friend seated comfortably in a neighbouring café, where he has been, he assures you, for the last hour. Yes, the inauguration of stations would indeed be a blessing!

### The Paris-Trouville Race.

ORGANIZED by *Le Journal*, this race presented many unique features, as it embraced classes for pedestrians, horses, cyclists, motor-cyclists, and automobilists, and could in all truth be styled an omnium handicap. The distance between Paris and Trouville is 175 kilometres, and the handicap framed by the promoters was as follows:—Pedestrians started from Saint Germain on Saturday at 9 p.m.; horses, Sunday, 3 a.m.; cyclists, Sunday, mid-day; motor-cyclists, Sunday, 1.45 p.m.; automobilists, Sunday, 2 p.m. The first and second to arrive at Trouville were horses, both finishing considerably in advance of the third arrival, a motor-cyclist. The classification was as follows:—Pedestrians: 1 Desgrauchamps, 2 Boitard, 3 Borrino; average per hour, 8 kil. 100 m. Horses: 1 Giren, 2 Bougon, 3 Poulingue; average per hour, 14 kil. Cyclists: 1 Mion, 2 Stein, 3 Hildebrand; average per hour, 34 kil. Motor-cyclists: 1 Teste, 2 Bertin, 3 Osmont; average per hour, 57 kil. Automobilists: 1 Antony, 2 Levegh, 3 Hénon; average per hour, 58 kil. In the general classification the order of the first ten arrivals was as follows:—1 Giren (horse), 2 Bougon (horse), 3 Teste (motor-cycle), 4 Antony (motor-car), 5 Levegh (motor-car), 6 Bertin (motor-cycle), 7 Osmont (motor-cycle), 8 Bardin (motor-cycle), 9 Gasté (motor-cycle), 10 Poulingue (horse). The average speeds maintained by the leading motor-cycles and the automobiles are truly extraordinary. The two first automobiles were the Mors cars, which were so successful in the Paris-St. Malo race.

### A Paris-Trouville Race for Motor-Cycles and Voiturettes.

THE same day as the Paris-Trouville handicap was run off a number of motor-cycles and voiturettes competed over the same route. The race was known as the "coupe des chauffeurs amateurs." The start took place at 10 in the morning, and the first motor-cycle reached Trouville at 2 o'clock. This was Seignol, Cormier being second at 2.14, and Arnaud third. In the voiturette class, Louis Renaud arrived first at 3.41; and Marcel Renaud at 4.48. The third was a Cyrano de Bergerac car at 6.31. The two first voiturettes are those well known as the "Renaud," supplied by Messrs. Farman & Co. These cars are by no means racing vehicles, and considering they are fitted with a De Dion 1½-h.p. motor, and can carry two persons, the result is not bad. It shows that the car (which is provided with three forward speeds and one reverse motion) is reliable.

### Feeding Pillars for Electrical Vehicles.

IN November last year the Syndicat Professionnel des Industries Electriques, the Association Amicale des Ingénieurs-électriciens, the Automobile Club de France, and the Syndicat des Usines d'Electricite opened a competition for the best feeding pillar for supplying electrical energy to the accumulators of electric vehicles. The jury appointed to consider the designs submitted has just made its award. It appears that only four entries were received. The report on the apparatus submitted is to the effect that as a whole the competitors have complied with the technical requirements, and that in certain cases provision has also been made for prepayment for the energy supplied. The chief fault found is the great cost of the complete apparatus, which ranges from £28 to £54, this not including the necessary connections. The universal connector for use with the pillars has also been less well thought out, and the judges do not consider any of the samples submitted satisfactory. One of the devices so received is apt to earth the supply, and the other may cause short circuits if not judiciously handled. Here, again, the judges complain of the cost. The prize of 400 fr. (£16) is being equally divided between La Compagnie Générale des Travaux, d'Eclairage et de Force, in collaboration with La Compagnie Continentale pour la Fabrication des

Compteurs à Gaz, and La Société pour le Travail Électrique des Métaux.

### The Berlin Motor-Car Exhibition.

IN connection with the Berlin motor-car exhibition which opens on Sunday next, the 3rd inst., and which promises to be of a very important character, the authorities have decided to organize a series of daily motor-car trips around Berlin. In addition a race for motor-cycles and voiturettes between Berlin, Baumgartenbruck and back is to be run off on September 12th, and on the 17th inst. there will be an automobile race from Berlin to Dresden.

## "THE AMATEUR MOTORIST'S OUTING ;"

OR, "A FRIEND IN NEED IS A FRIEND INDEED."

1.—THE START.

2.—AN INTERLUDE.

3.—THE RETURN.

## CORRESPONDENCE.

### WANTED—A UNIFORM FOR MOTOR-CAR DRIVERS.

TO THE EDITOR OF *The Motor-Car Journal*.

SIR,—Will any of your readers kindly tell me of a suitable livery or uniform for a man-servant in charge of a motor-car? I cannot let my servant accompany me in coachman's livery—top-boots being somewhat out of place in the absence of a horse—but do not know what to replace it with.

I am, Sir, yours truly,  
East Moulsey, August 28th, 1899. PHYSICIAN.

### THIRTY MILES PER HOUR UPHILL!

TO THE EDITOR OF *The Motor-Car Journal*.

SIR,—Referring to the account in your issue of the 18th inst. of the case which was heard before the Isle of Wight county magistrates, one witness swore I was going thirty miles an hour—all uphill!

As my machine is a 4-h.p. English Daimler geared to a maximum of fourteen miles an hour, and as I cannot get up the hill in question on the top speed, you will at once see the absurdity of the statement without my making any further remarks.

The Terrace, Ryde, I.W., Yours truly,  
August 25th, 1899. W. PLAYER BRIGSTOCKE.

### FROM COVENTRY TO ABERYSTWYTH.

TO THE EDITOR OF *The Motor-Car Journal*.

SIR,—I recently ordered a *chars-a-banc* from the Motor Manufacturing Co., and accepted delivery at the works at Coventry on the evening of Saturday, August 5th, travelling to West Bromwich and stopping there for the night. On Sunday morning at 9 o'clock I started for Wolverhampton, putting in at one of the cycle works for forty minutes, where we filled up and took in a supply of petrol. Then on to Shifnal, staying two hours owing to heavy rain, and on to Wallington and Shrewsbury, the "best eleven miles of good roads one could wish for," stopping 1½ hours at Shrewsbury. Being misled I went nearly as far as Oswestry, then through Knockin and Llanymynech to Welshpool and Newtown, staying one hour at each of the last two towns; on to Llanidloes, reaching there at 8.45, in the rain. We put up for the night, leaving there at 7 o'clock Monday morning, and reached Aberystwyth at 10 o'clock. The *chars-a-banc* has given every satisfaction. It carries eight passengers, and has a 5½-h.p. Daimler motor. I may say the trip throughout was most enjoyable, and caused surprise to all the villagers as we passed through. Wishing your Journal continued success,

Mill Street Works, I am, yours truly,  
Aberystwyth, Aug. 26th, 1899. W. H. HOLLIER.

P.S.—The total distance travelled was 154 miles, ninety-two being journeyed on the Sunday, and thirteen gallons of petrol being used.

### ON TOUR BY MOTOR-CAR.

TO THE EDITOR OF *The Motor-Car Journal*.

SIR,—The tour referred to in your last issue has now commenced. The week before last my car was brought from Aberdeen to Edinburgh, and at that time was fitted with Carmont's shielded rubber tires, which were uncommonly heavy, averaging 75 lb. each; yet the journey was performed at an average of eight miles an hour. I had a week to spare in Edinburgh before commencing tour, so took several runs to interesting spots around "Modern Athens." On Wednesday, the 23rd inst., I was favoured with a call from

Mr. Percy Richardson, the representative of the Daimler Motor Company, Ltd., who took a short trip on my car, and gratified me with an expression of complete satisfaction at the way my motor was working. Naturally, before starting on so long a tour as mine promises to be we gave the car a minute inspection, and, seeing that several of the iron shields of the tires were eating into the rubber, on the advice of Mr. Richardson at once decided to have new Clincher tires fitted. In a few minutes my wants were made known to Mr. Stephens, the genial manager of the North British Rubber Company, Ltd., at their Prince's Street shop in Edinburgh, and he immediately took his place by my side, when we motored to the Castle Mills, and soon the wheels were under the scrutiny of their affable manager of works, Mr. John Cockburn, who advised me to have a new section of rubber especially designed for motors, to which I at once consented. He expects great things from this new style, and as mine is the first car to which they have been fitted I have promised to let him know from time to time how they wear and answer. The results obtained with regard to this should be of considerable interest to motor-car manufacturers. "Celerity" was the word at the "Clincher" works, so quickly were my wheels transformed. The moment I mounted the car I was delighted at the improvement. We scaled at the North British Rubber Co.'s weighing machine and balanced at 22 cwt. 1 qr., with water and oil, whereas previously under the same conditions we weighed 24 cwt. 3 qr. Our start for Carlisle was timed for 8 a.m. on Friday, the 25th inst., and after leaving the "Clincher" works on Thursday we loaded up a "cinematograph" fixed to a biunial lantern, a "colour photography" apparatus for projection by the Ives' process, two 40-ft. cylinders, one each of oxygen and hydrogen, and other paraphernalia incidental to the show—in all quite 8 cwt. At the last minute I had an urgent call to Glasgow, so I had to send my friend, Mr. A. Sinclair (who is to officiate as driver and cinematograph operator), off by himself, and arranged to meet him by train at Carlisle. This I did on Saturday, and he reported the journey a great success. The car was much admired *en route*, and caused quite a sensation at Langholm, N.B., where he stayed for the night. The journey was done at an average of ten miles an hour, and when one considers that there are some stiff pulls over the Cheviots, I think (considering the weight) this establishes something of a record. The quantity of petrol (which was obtained from Mr. Peter Lee, of Glasgow) consumed was less than 8 gallons for 103 miles. At Carlisle station, where the car awaited my arrival by train, quite a crowd of admirers were around, and you could hear a distinct hum of approbation as we glided from the station precincts for Burgh-by-Sands, distant from Carlisle nine miles, and which we reached in less than an hour. The natives there and *en route* were very much astonished, and the sensation caused seems to bode well for a good "house" on our opening night. We stabled at the Lowther Arms, within a mile of the monument erected on the marsh at the spot where King Edward I. ("Longshanks") died, and this morning we motored to seven or eight hamlets in the vicinity, announcing our entertainment for to-night.

From this first experience I am convinced I possess a very valuable advertising adjunct—the trumpet brings the people out, they gaze, they inquire, they are handed a leaflet, and we return rejoicing that the whole district for miles around knows of our visit, and in anticipation of a bumper "house." The car will assuredly assist to bring grist to my mill, to say nothing of its exhilarating influences on myself, my driver, and my pianist. I believe I am the first to incorporate the use of a motor with a travelling entertainment, and being confident of its utility for such purposes I have no desire to keep the knowledge of its benefits "up my sleeve," but through the journals associated with our business hope to make my success known to brother performers, and I am sure some of them will be spirited enough to "hurry up and go and do likewise." I trust that many of that huge section of humanity known as "the Profession" will take your hint

(and, may I say, mine?)—go in for a motor, enjoy its revivifying influence, find it a paying institution, and astonish the natives not only with their art and skill, but also in the way they come and the way they go.

Yours truly,

T. J. WEST,

Burgh-by-Sands, Manager, "Modern Marvel" Co., Ltd.  
August 28th, 1899. (of Edinburgh).

## THE MOTOR-CAR SHOW AT DOVER.

As already announced, the Mayor of Dover, Sir W. H. Crundall, J.P., is making arrangements for a three days show of automobiles to be held from Tuesday, the 19th, to Thursday, the 21st inst., simultaneously with the meeting of the British Association then taking place.

The show will be held on the Athletic Ground of Dover, which is well adapted for such purpose, possessing a hard track with firm foundation, capable of carrying the very heaviest class of vehicle. It is about  $2\frac{3}{4}$  laps to the mile, and is slightly banked. The exhibition will comprise—(a) exhibition of stationary motor-vehicles, (b) motor-vehicles running on the track, (c) competitions, races, etc. Cover will be provided for those exhibits which require it.

The following gentlemen will act as a judging committee: Mr. W. Worby Beaumont, Professor C. Vernon Boys, Mr. H. Graham Harris, Major Holden, R.A., Sir W. H. Preece, Mr. B. Boverton Redwood, Professor H. S. Hele-Shaw, and Mr. James Swinburne.

Prizes and certificates will be awarded for—(1) Practical running and general control of automobiles: Class (a), best motor-vehicle irrespective of body under  $1\frac{1}{2}$  tons unladen; Class (b), best motor-vehicle irrespective of body under 2 tons unladen; Class (c), best motor-vehicle irrespective of body under 3 tons unladen. (2) Utility of vans and other automotors. (3) Economy of fuel consumption, combined with general efficiency. (4) Elegance of design and workmanship of body of car. (5) Novelty of purpose and design. (6) Excellence of parts applicable to use with automobiles. (7) Designs of special automobiles or parts thereof, represented by drawings and descriptions.

The prize fund has been started with a grant of £100 by the local executive committee of the British Association Dover meeting; to this will be added one-third of the gross gate receipts, without deduction of any kind. Certificates will also be awarded with prizes, and for all commended exhibits. Competitions will also be organized and prizes offered to owners or drivers for tricycle, bicycle and obstacle races, etc. The exhibition has, we are informed, been certified by the Board of Trade to be an International Exhibition, under the provisions of sections 39 and 57 of the Patent Designs and Trade Marks Act, 1883.

THE BRITISH MOTOR COUPÉ CO., of Euston Road, N.W., received from Germany on Wednesday a German Daimler motor *chairs-a-banc*, having seating accommodation for no less than twenty persons. The car, which is the largest of its type in this country, is fitted with a two-cylinder motor, giving 10 b.h.p.; it has four forward speeds and one reverse motion.

A RACE MEETING of the Motor-Car Club will be held at the Crystal Palace track on Wednesday, the 13th inst., commencing at 4.30, when some very interesting competitions will take place. Among the various events are:—One mile handicap, two mile handicap, five mile championship of the Motor-Car Club, and also a race for roadster machines. In this race Messrs. Edge, Jarrott and Wridgway will be barred, although they have entered for all the other contests. Applications for entry forms should immediately be made to the Honorary Secretary at 40 Holborn Viaduct, E.C., as the entries close on Friday next, the 8th inst.

## JOTTINGS BY A WORLDLING.

COUNT TALLEYRAND VON SIERSTORPFF has at last definitely formed the Automobile Club of Germany. He is, of course, on the committee himself, and among his *confreres* are Princes Hohenlohe and Fürstenberg and Count Ratibor. The Duke of Ratibor is president, and the Hereditary Prince Philip Ernest of Hohenlohe and Count Schönborn the vice-presidents. I am rather surprised that Count Voss, the lawn tennis champion of Germany, is not a member of the committee, as this young officer, who is the Chamberlain of the Grand Duchess of Mecklenburg-Schwerin, is one of the most enthusiastic "chauffeurs" on the Continent. He drives with great judgment, although it seemed to me that he was a little too reckless on the Riviera last winter—not quite so bad as Prince Orloff, perhaps, but bad enough. If I remember rightly, he won one of the races organized by the Nice Club on his Panhard-Levassor car—from Nice to Castellane, I think it was. He has recently bought another carriage of the same make, which he drove from Paris to his home in Schwerin, making good times when the roads and police allowed it.

TALKING of the police, the Automobile Club of Switzerland are having an amusing passage of arms with the Mayor of Versoix, a small township of no importance, near Geneva. The worthy mayor has issued an edict that any one driving through the place at a pace greater than that of a man walking will be fined five francs! M. Têrond, one of the vice-presidents of the Club, in answer said that it was hardly worth while discussing the Mayor's action, but he would like to point out that in Geneva, Paris, London, and Brussels the police allowed at least the pace of a trotting horse. "But," he added, "it would appear that the traffic in the streets of Versoix is of greater importance than in these hamlets!"

THE Swiss Club, the head-quarters of which are in the charming Parc des Eaux Vives at Geneva, was founded at the end of last year, *duce et auspice* M. Ernest Cuénod, the most cosmopolitan of all motor-car enthusiasts. The Club is a complete success, and I would advise anybody who is likely to take his car to Switzerland to put his name down for election as a foreign member. The subscription is nominal, only a few francs, and a member of any recognised English club would have no difficulty in finding a proposer and seconder.

MONSIEUR CUÉNOD, whom I referred to above, often comes to England. He is a member of our Automobile Club, and speaks English like an Englishman. He lives in Paris the greater of the year, but he has a delightful house on the Lake of Geneva, which he reaches in two days on his car, although it is so many hundreds of miles away. He is a great believer in the Georges Richard car; I believe, indeed, he is going to join the board of the new company. He has himself invented a safety brake, to be used only in emergencies, as it acts so powerfully on the ground that in stopping the car "dead," it might throw the passenger out. It is very effective, and is being fitted to many racing cars; it can be used also as a jack to lift the back wheels from the ground.

MONSIEUR CUÉNOD was very kind to me when I was driving through Geneva in the spring. As soon as I was introduced to him he proposed me for the Club, and, with Prince Bibesco as seconder, I was soon elected. He was also kind enough to ask me out to his château at Rolles for lunch. A delightful day!—a splendid run out from the Métropole, M. Cuénod and Prince Bibesco on motor-cycles, M. Panchand in a Mors car for a little way, and myself; a glass of absinthe at the Tête de Nègre hostelry in the village; a delightful *déjeuner* at M. Cuénod's; a visit to a new house he was buying further up the lake; and then back into Geneva after tea.

## MIDLAND MOTOR NOTES.

By "HERCULES."

### The Motor-Tricycle Races at Birmingham.

THE races at Birmingham on Wednesday last week, in addition to providing the public with an excellent opportunity of seeing what really can be done with motors, demonstrated how vastly more interesting a race between motor-tricycles really is than the long-distance races between cyclists. There is practically little difference between shorter races, but the cycle races over longer distances, as everyone knows, are more or less uninteresting, riders playing a "waiting game," and reserving themselves for a rush at the close. How often have the spectators grumbled at the "crawls" which have been the chief feature during the greater part of the time occupied by a cycle race. In races between motor-tricycles there is nothing of this kind. There is no necessity to "conserve" the driving force for a big effort at the close; the pace can be maintained from start to finish. The terrific speed at which the machines travelled throughout the long-distance races and the ease with which they could be controlled by the riders excited the keenest interest in the minds of the spectators, and this interest never flagged until the race was ended and the honours won. There is no doubt that motor racing in England will become exceedingly popular.

### More Races Projected.

STIMULATED by the success of the motor-race meeting at Aston last week, the directors of *Sport and Play* will probably hold another one on a more elaborate scale some time during October.

### Racing Tracks for Motor-Tricycles.

MANY of the present tracks, however admirably adapted for cycle races, will not be so suitable for motors. They are not sufficiently "banked" for the high speeds at which motor-tricycles can be run, nor are they wide enough to allow the competitors room to pass each other. But such tracks as the Aston one, which is splendidly banked, and that at the Crystal Palace leave little or nothing to be desired.

### Motor-Tricycle Tires.

THAT there is still room for improvement in the pneumatic tires used on motor-tricycles was evidenced by the fact that one or two went wrong during the races at Aston last week. There must be an element of danger in a tire giving way with the machine flying along at a rate approaching forty miles per hour. It is satisfactory to know that the question is engaging the attention of experts in tire construction, and it may confidently be anticipated that their cogitations will result in the production of a tire which will meet all requirements.

### Motor Tricycle Races and the Public.

THE growing popularity of motor-machines is shown by the importance which the daily papers attached to Wednesday's races. Lengthy reports were given, and the racing was freely commented upon. There cannot be any doubt that the races created a very favourable impression on all who saw them. Many were "disillusionised." Some people have an idea that it is impossible for a motor to run for a whole hour without a breakdown of some sort. This illusion was dispelled, for the most convincing proof was given that motor-tricycles can be driven at top speed for several hours without the slightest mishap occurring. The machines were before the eyes of the spectators the whole of the time, so it was impossible for anything to go wrong without their cognisance; and there can be no better way of demonstrating the

capabilities of a machine than the severe tests those went through last week with such excellent results. An hour's run on a track, before the critical gaze of thousands of spectators, will give greater confidence in motors than a two or three hundred miles race on the road, for "seeing is believing," to use a common phrase.

## A USEFUL SURFACE INDICATOR FOR MOTOR-VEHICLES.

IT is a very difficult matter to know when a motor-car is travelling upon a level surface, going up or down imperceptible inclines, as likewise the gradients of up or down steep hills. With a view of removing the difficulty,

the United Motor Industries, of 3 Rue Meyerbeer, Paris, has lately introduced a useful little device to indicate the variations of the surface at a glance, and so guide the driver as to when to change his speed gear according to the ground driven over, and assist in obtaining proper power from the motor in comparison with the surface over which one is travelling. The instrument indicates from 1 to 100; thus, suppose one is going up a hill 1 in 8 or 1 in 12, the surface indicator will point to either 8 or 12.

In use, the indicator is placed on the front board before the driver. After having obtained the level, so that the needle is pointing in the centre on 0, by turning the adjustable point upwards or in the opposite direction, the apparatus is screwed to the front board. It is essential that the motor-car be standing on the level itself previous to fixing the instrument in its proper place. In order that the needle should point to 0, it is necessary to tap sharply with the forefinger on the top, as the thick liquid over the face—necessary against vibrations—sometimes stops the needle from revolving, especially at starting; therefore a certain amount of vibration or tapping is necessary to ensure the proper working of the needle. An occasional tap on the top will cause the needle to indicate the exact gradient. We understand that these gradient indicators are largely used by automobilists in France.

MR. C. VERNON PUGH (managing director Rudge-Whitworth, Limited), in company with Messrs. Lanchester Brothers, rode a Lanchester motor-car in the Birmingham cyclists' parade on Friday last week.

MR. FRANK F. WELLINGTON, 36 St. George's Square, Regent's Park, N.W., is issuing a monthly "Motor-Car Register" of cars and sundries for sale, a copy of No. 2 of which he has sent us.

THE Albert Eadie Chain Co., of Redditch, have just introduced a  $1\frac{1}{2}$ -in. pitch twin-roller chain for motor-cars. A sample of the chain has been submitted to the engineering department of Mason's University College, Birmingham, and the report of the test states that the breaking load of the chain was found to be 4,614 lb.

THE *Electrical World* of New York announces that the Lanchester Motor Company has been formed at Trenton, N.J., with a capital of 5,000,000 dols. (£1,000,000). The incorporators are Percy C. Hamilton, Pittsburg; George S. Stidwell, T. Reginald Horley, and Byron Traver, New York; and Joseph V. Clark, Jersey City. The purpose of the Company is to control the American patents of Mr. Frederick William Lanchester, of Birmingham, England.

## SCOTTISH NOTES.

**The Autumn Tour.**

NATURALLY the decision of the Automobile Club of Great Britain to postpone their visit to the land of "the mountains and the flood" for another year has caused great disappointment among Scottish autocarists. The decision to postpone their visit north for another year is to be regretted, for it was anticipated that the peregrination through the leading Scottish towns of a large number of "chauffeurs," accompanied, as it would naturally have been, with a great fanfare at the hands of the daily press, would have given a fillip to the movement in this "land o' cakes." I understand that an effort will shortly be made to organize a brief tour of Scotch automobilists, probably toward the end of the present month, and if all who are interested in the advancement of automobilism in the North will co-operate, quite an imposing turn out of motor-carriages can, I am sure, be made, and will undoubtedly prove a useful object lesson in many places.

**An Apparent Anomaly.**

IT struck me as rather an anomaly, though undoubtedly a forecast of the future, to see motor-cars plying with fares at a horse race meeting. This was on the occasion of my visit to Hamilton last week, whither I had wended my way to see if there was anything fresh to chronicle in the motor-car world. The Saturday on which I happened to visit the ancient town was the second day of the Hamilton Park Race Company's autumn meeting, and, as I have indicated above, one could not help being struck when one saw the horseless carriage make its appearance, and, what is more, being patronized by a crowd of "horsey" individuals. The cars moved quietly along among the horse-drawn traps, and appeared to cause little or no trouble to our equine friends.

**Motors and Barnum.**

It is now a perfectly common sight in many parts of Scotland to witness motor-vehicles at work wherever large gatherings of people take place. At athletic sports, races, exhibitions, shows, or the like the motor-car is invariably in evidence, and without exception is well patronised, distinctly indicating the growth of public appreciation and favour. The "greatest show on earth" visited Motherwell on Wednesday of this week, and as the site selected by Barnum and Bailey's mammoth concern was at a considerable distance from the station, I was pleased to note that the local hiring company had seen in this another fine opportunity for reaping a harvest. Quite a large fleet of cars was put on the road, and might be seen all day running with crowds of country visitors from all the outlying districts, who had adopted the most novel and speedy method of reaching the pitch of the monster camp. The speed at which the cars ran enabled them to put in about two journeys to the horse-drawn vehicles' one, with a corresponding increase in the bringing of grist to the mill.

**Glasgow Trades Holiday.**

SATURDAY last was a Glasgow Trades Holiday, and thousands of the hard-working sons of toil were released from the cares of bread-earning. Not the least popular method, as on previous occasions, of putting in a day's enjoyment was that to be obtained by means of an automobile run, and on enquiry at the hiring depôt at Hamilton I found that every available car was called into requisition to meet the demands of the excursionists. The Glasgow stone carvers, among others, had their annual "beanfeast" on that day, and, taking train from Glasgow to Hamilton, on arrival at the ducal town they boarded several horseless carriages, and were

conveyed to Lanark and the Falls of Clyde. The road down Clydeside is, as is well known, one of the finest in Scotland both in point of scenery and surface. The Edinburgh Autocar Co., too, were very busy, their fleet of cars being also busily employed conveying crowds of passengers to the various places of interest round about "Auld Reekie." The Forth Bridge is naturally still very popular, and the route taken to reach this famous structure is an excellent one, and well calculated to show off the capabilities of the automobile to the best advantage.

**The Edinburgh Autocar Company.**

THE Edinburgh Autocar Company, Ltd., are rapidly getting their new premises into ship shape, and this concern has now increased facilities for the prompt execution of all orders entrusted to them, be it for the hire of a motor-carriage for an hour or a month, or for the transport of goods to any part of the kingdom.

"BROWN HEATHER."

THE Birmingham Criterion Engineering Co., Ltd., of Legge Street, Birmingham, is reported to be taking up the construction of motor-cars and tricycles.

At the last meeting of the Dover Town Council, the application for a licence for several motor-carriages during the visit of the British Association was granted.

THE New Courier Cycle Co., late Chilton Bros., of Alexandra Street, Wolverhampton, are, we hear, constructing a new motor-carrier tricycle fitted with a 2½-h.p. motor.

THE steam omnibuses for the projected public service between Oneglia and Garesio, Italy, referred to in a recent issue, are to be constructed by Messrs. De Dion & Bouton, of Puteaux, near Paris.

THE Automobile Club of America has been incorporated at Albany, N.Y. The articles of incorporation, which are brief, specify that the objects of the organization are "to maintain a social club devoted to the sport of automobilism and to its development throughout the country; to arrange for pleasure runs; and to encourage road contests of all kinds among owners of automobiles."

THE Barnsley and District Motor-Car Company, Limited, has just been registered with a capital of £5,000 in £100 shares, to carry on the business of carriers of passengers and goods, forwarding agents, warehousemen, proprietors of locomotives and other engines, motor-cars, carriages, omnibuses, vans, trucks, and other vehicles, whether propelled by electricity, steam, oil, gas, compressed air or otherwise.

DE DION motor-tricycles are now being made in the United States by the Waltham Manufacturing Co., of Waltham, Mass., which has secured the American rights in the popular De Dion motor. Mr. Skinner, of the Waltham Co., recently journeyed from Waltham, Mass., to New York City on one of these machines, covering the 251 miles between the two cities in seventeen hours, and at a total cost for transportation of 45 cents, namely, 40 cents for petrol and 5 cents for lubricating oil.

ALREADY a number of firms have intimated to the Automobile Club that they will probably exhibit in the automobile section of the 1900 Paris Exhibition. The list of firms includes the following:—Electrical Undertakings (Limited), New Grappler Pneumatic Tyre Company (Limited), Messrs. Simpson & Bodman, Headland's Patent Electric Storage Battery Company (Limited), Mossberg Roller Bearings (Limited), Roller Bearings Company (Limited), Britannia Motor Company, Liquid Fuel Engineering Company, Clipper Pneumatic Tyre Company (Limited), Motor-Carriage Supply Company (Limited), Motor Manufacturing Company (Limited), Vickers, Sons, & Maxim (Limited), Stirling's Motor Carriages (Limited), the Daimler Motor Company (Limited), and Messrs. Roots & Venables.

## THE MANAGEMENT OF ELECTRIC VEHICLES.\*

THE electric vehicle as at present constructed has for its driving mechanism a storage battery, one or more motors and a compound switch or controller. There are usually provided within easy access of the operator a controlling handle, a reversing handle, by which the direction of the vehicle can be reversed, the brake, bell, and switches for turning on the electric light, etc. The battery or source of energy is capable of giving forth a certain quantity of energy, and this quantity in its results varies according to the way in which it is taken out. For instance: If it is called for in large flushes of current the battery will respond, but the total available output of the battery will be less than if the current is taken out in more moderate amounts.

Storage batteries are commonly rated in ampere hours; that is to say, the discharge in amperes that will obtain for an hour represents the ampere hours. The discharge in amperes that will obtain during two hours multiplied by two represents the ampere-hour discharge, thus a cell of 100 ampere-hours capacity may give 30 amperes for three and one-third hours. If, however, an attempt is made to discharge it at 40 amperes it is possible that it may succeed in giving this current for only two hours, a total of 80 ampere hours and with a demand of 50 amperes, the total ampere hours would be less; therefore we may lay down as a fundamental rule that to make a long trip with an electric vehicle with a single charge of battery, heavy flushes of current are to be avoided.

A heavy flush of current at the motors may be induced in a number of ways; quick starts, especially on grades, conduce to these excessive charges from the battery; in short, any case where power is suddenly required of the motors. Attempts to start while the wheels are stopped by any obstacle, or bound by the brakes, are similarly detrimental, not only to the charge within the battery at the time, but the actual life of the battery itself, which is none too long at the best.

Another important point in the management of electric vehicles is the starting and stopping. The preliminary acceleration of full speed costs twice as much and often more power as the subsequent energy at the full speed thus once attained. The first application of the energy is to give the vehicle its momentum and to overcome the friction necessary to drive it at a certain speed. As soon as the momentum is obtained the motor drops to the suitable current that overcomes the friction which obtains. Therefore, if a long trip is to be made, the fewer starts and stops that are incurred the greater the economy of the charge and the further the vehicle will run on a given charge.

Another point in which the manager of an electric carriage must be careful is the use of the brake. The less the brake is used the better. It is very enticing to dash up to your destination at high speed and suddenly stop, but it is much more economical to shut off the current a little earlier and coast up to the stopping place. The brakes used consume heat; heat is energy, and the storage battery has to pay for it. Hence, use the brake as little as possible.

There is usually provided on the vehicle an instrument known as an ammeter, which measures the ampere discharge at the batteries. By consulting this instrument at any time the manager of the vehicle can tell whether or not he is calling for excessive current, and knowing the capacity of his batteries he will know what current is moderate, what is large and what is excessive.

If long mileage is to be obtained with a single charge it is necessary to run the motors at their most economical speed; that is to say, at their full capacity. The electric motor is very similar to other devices in respect to efficiency. At a light load its efficiency may be as low as 40 per cent.; that is to say, 40 per cent. of the electric energy supplied at

the motors appears as useful power at the wheels to drive the vehicle. When the motor is fully loaded the efficiency may rise to 80 or 85 per cent., and in the larger sizes of motors possibly more. Therefore, it follows that if the capacity of the storage battery is not exceeded, and a long run is desired to be made, the motor must be kept as nearly as possible at its full speed and power. On over loads the efficiency of the motor drops again. It is necessary to depart from the above conditions continually in driving a motor-vehicle, but they should be ideals to be aimed at. With poor management a motor-vehicle that should make a run of fifty miles may make less than thirty.

There is also provided on most motor-vehicles an instrument known as a voltmeter. This instrument measures the electrical pressure at which the batteries supply their amperes, and its indications form a very accurate criterion of the condition of the batteries. The latter should give two volts per cell. Thus, in a battery containing 40 cells the voltage should be 80. On a full new charge the voltage may rise as high as 2.2 volts per cell, thus making the initial starting voltage 88. When the cells are discharged as low as 1.8 volts per cell, they should be considered discharged, for although they are capable of supplying additional power at the reduced voltage, the power which must be put back in them to restore them to their original condition is vastly out of proportion to the power that can thus be taken from them.

A battery of cells should never be left in a discharged condition. If this is done an action which is known as sulphating occurs; that is say, the acid attacks the plates and forms a corrosive salt, which is detrimental to the cell, and moreover the process is detrimental to the plates. Sulphating can in a measure be removed by giving the cells a heavy overcharge, but the cells should never be allowed to reach such a condition. A sulphated cell is very deceptive with regard to the voltage indications. It is likely to indicate a much higher voltage at a state of almost complete discharge than a cell in good order would do.

It is never well to charge the battery inside the vehicle. Means are provided in many vehicles for doing this, but the offensive fumes which are given off in charging are very detrimental to any metal work with which they may come in contact. The cells should be removed when charged. If in handling the cells any of the fluid is spilt from them, especially when they are in a charged condition, it may be replaced with clean water. An attempt to use acid and water may result disastrously. It is far better to have the electrolyte a little too weak than a little too strong.

Storage batteries are in fact the horse of the vehicle, and every effort should be made to learn their frailties and to humour them in precisely the way the horse is humoured. Like the horse, if called upon to do an excessive amount of work they will do it uncomplainingly, but at the expense of their life. In this fact lies great danger in the management of storage batteries. They perform severe tasks without apparent exertion, but presently they will fail to respond altogether, the positive plates being possibly bent or short circuited and destroyed.

The items of expense in the running of a motor-vehicle are: Electricity for charging purposes, maintenance of positive plates of battery, general maintenance of the vehicle, storage, and minor charges. The first two of these items are the most severe, and easily amount to 75 per cent. of the total expense. For the rest of the vehicle it may be said that the maintenance compares with the maintenance of an ordinary carriage and harness.

For a two-seated vehicle weighing from 1,000 to 1,500 lb., capable of a maximum speed of fifteen miles an hour at a radius operation of forty miles, the total expense is about £5 per month, the vehicle being in service every day.

"DIE AUTOMOBILE" is the title of a new fortnightly journal which is about to be issued in Berlin.

\* By George T. Hanchett, in the New York *Automobile*.

## THE BROWN-WHITNEY STEAM CAR.

WE learn that Messrs. Brown Bros., Ltd., of Great Eastern Street, London, E.C., have obtained the sole control of the patents for the United Kingdom and the Colonies in the Whitney steam car, which attracted so much attention at the recent Exhibition at the Agricultural Hall. We have already given a description of this car (see *Motor-Car Journal*, June 2nd and 9th last), which is made both on the crank-driven principle (the engine driving directly on the rear axle) and as a chain-driven vehicle, the latter type being shown in the accompanying illustration. Amongst the principal advantages claimed for the Whitney car may be mentioned the following: The steam pressure is automatically

regulated. The steam is generated by gas produced from petrol, the control of which is automatic. Absolute freedom from vibration when the car is running or at rest, and entire absence of noise. The steering, speed and reverse motions are all governed by one handle. Invisible exhaust. Remarkable hill-climbing powers. Speed to forty miles an hour. Absence of wearing parts, the main axle being the only revolving part. The small quantity of water consumed per mile. Messrs. Brown Bros. inform us that they hope to be able to make deliveries of the new car about the end of November next.

A NEW motor-car is, we hear, in course of construction at a small cycle factory in Stockwell, S.W.

MESSRS. E. C. STEARNS & Co., of Syracuse, N.Y., have just completed the manufacture of an electric motor-vehicle. It has a 4-h.p. motor, operated by a storage battery of 44 cells which enables it to run thirty miles on ordinary roads. The steering gear, described as being very sensitive, requires but a slight touch to turn the wheels, and there is scarcely any jolting or vibration.

A NEW motor-carriage is being introduced by Mr. G. M. Holley, of Bradford, Pa. It is propelled by a single-cylinder petrol motor, cylinder  $3\frac{1}{2}$  by  $4\frac{1}{4}$  in. It has no poppet valves, and all its operations are said to be smooth and without jamming or noise of any kind. The operations of the Otto cycle are performed by a rotary valve made of tool steel with seat of cast iron. An electric make-and-break igniter is used. There is said to be no vibration from the engine when running in the carriage for the reason that the framework, carriage body and running gear are all bolted together, depending on large pneumatic tires for easy riding qualities. The complete weight of the car, with water and petrol for 100 miles, is 280 lb. It has a hill-climbing gear of five miles per hour, and a speed gear for a maximum of twenty-four miles per hour, so that by varying the speed of the motor any speed from two to twenty-four miles per hour can be obtained. The wheels are 26 in. in diameter, with  $2\frac{1}{2}$ -in. tires.

## MOTOR-CAR ACCIDENT.

MR. ROBERT WESTON, of Cedar House, Cowley Grove, near Harrow, was riding into town on Tuesday morning with his wife on a small motor-car when, near Paddington, an accident occurred. Mrs. Weston called her husband's attention to a new building in course of erection, and for the moment he incautiously neglected his steering apparatus, the result being that the motor-car crashed into the side of a pony-carriage, which was standing by the roadside, and knocked it over. Miss Hartshorne, who was sitting in the carriage, was thrown out and much bruised and cut, but the driver escaped unhurt. Mrs. Weston was jerked off the car by the shock, and fell with her right arm beneath her, breaking it. Both ladies were placed upon the motor-car and driven by Mr. Weston to a surgeon's, and afterwards they proceeded home.

## AN ABORTIVE MOTOR-CAR COMPANY.

THE creditors of G. H. Griffin, financier, Parliament Mansions, Victoria Street, Westminster, and late of the Hillock, Courtholt Road, Birmingham, met at the London Bankruptcy Court on the 28th ult. The receiving order was made on the petition of Messrs. White & Pike, printers, Birmingham. The debtor came over from New York in 1895, and became interested in the promotion of the English Motor and Road-Car Manufacturing Co., Ltd., which was to be formed to purchase the Anglo-French Motor-Car Co., of Birmingham (in liquidation). The attempt to float the company was unsuccessful. The accounts show a deficiency of £354, and the failure is attributed to liabilities in connection with the English Motor-Car Co. An offer to pay the debts by weekly instalments was refused, and the case was left in the hands of the Official Receiver, to be wound up in bankruptcy.

## TO BRAINTREE BY MOTOR-CAR.

SHORTLY after breakfast on Saturday morning last a party, comprising three foremen at the Royal Small Arms Factory and two friends, set out from Enfield for Braintree, Essex, aboard Mr. Seal's motor-car, with that gentleman as their pilot. The outward journey was made *via* Hoddesdon, Bishop's Stortford, and Dunmow. Arrived at Braintree dinner was partaken of, and a further run on to the village of Bocking was made. Having indulged to their hearts' content in the rural scenes to be found in that part of Essex, the party returned to Braintree, Dunmow, and then headed for Sawbridgeworth, which was found to be a great improvement so far as the condition of the roads was concerned, and home through Epping and Waltham Abbey, Enfield Lock being reached at about 9.45 without a single hitch on the part of the motor occurring. A little untoward circumstance happened, however, on the homeward journey which tended towards "a dampening of their spirits," *i.e.*, they were overtaken by a severe thunderstorm. This notwithstanding, the excursion was unanimously voted a most enjoyable one; indeed, more than one of the company declared that it "fairly eclipsed everything they had previously experienced in the form of a country ride."—*The Middlesex Gazette*.

## A MOTOR-CAR FRIGHT.

AT the Hove Police-Court last week Benjamin Burbridge, of Mighell Street, Brighton, was summoned for that he being the driver of a light locomotive on the highway did not, on the request of a person having charge of a restive horse, cause such light locomotive to stop and to remain stationary so long as was reasonably necessary, at Patcham, on August 8th. William Edward Marples, engineer, Hannington Villas, Preston Park, said that on August 8th, about 12.20 p.m., in company with Mr. Astley Metherell, he was riding on horseback on the London Road at Withean, proceeding towards Brighton. The defendant, who was driving a licensed passenger motor-car, was behind him, and when some fifty yards off witness turned and put up his hand, and called out "Slowly, slowly!" because his horse had commenced to buck. When defendant got close to him he requested him to stop, as his horse had got more restive. Defendant, however, did not stop or check his speed, and when he passed him turned round and laughed at him, as also did the passengers on the car. Defendant denied that complainant put up his hand to signal him to stop, and said he also warned him of the approach of the motor-car. Astley Metherell, 5 Port Hall Road, who was riding on horseback in company with the previous witness on the day in question, gave corroborative evidence, and also said that no warning of the approach of the motor-car was given by the defendant. Defendant said nothing occurred till he passed the complainant's horse, he having slowed up as he did so. He saw nothing to necessitate him to stop. He was not responsible for the passengers laughing at complainant. He had driven motor-cars and other locomotives in different parts of the country for over two years, and never had a complaint made against him before. The Bench fined the defendant 40s. including costs, or in default ten days imprisonment.

A NEW firm has just been formed in Milan, Italy, with a capital of £4,000, under the style of A. Caffaratti & Co., to deal in motor-cars and cycles.

# THE Motor-Car Journal.

Vol. I.]

LONDON, FRIDAY, SEPTEMBER 8th, 1899.

Published Weekly by CORDINGLEY & CO., 39 & 40 Shoe Lane, London, E.C.

## COMMENTS.

MOTORISTS are naturally interested in the preservation of historic spots and beautiful places, and the suggestion that Stonehenge is in the market, like any ordinary suburban villa, will come as a shock to those who went thither on the occasion of the Automobile Club's Easter tour. Seeing that there are several public roads around the monument, few have realised, till now, that this memorial of Druidical

days was really a private possession. One thing is certain: something should be done to preserve the trilithons from the risk of injury to which they are now subject from the wanton chipping in which visitors sometimes indulge. There are none too many of such antiquarian scenes as that of Stonehenge that we can afford to lose what remain, and such areas should be regarded as objects of national concern. The motor-car affords facilities for touring to such places that have hitherto been denied to pleasure seekers, and motorists should be well to the front in any agitation to retain Stonehenge and all such resorts for the pleasure of the people.

### The Automobile Club's Autumn Tour.

WE have previously published the programme of the autumn tour of the Automobile Club, which commences on the 16th inst. Already a large number of members have notified their intention of joining the party, which will

include Mr. Hutchinson on a motor-tricycle, Mr. Geo. Iden on a Princess car, Mr. and Mrs. Lyons Sampson on a Benz car, Mr. and Mrs. Soames on a Daimler car, Mr. Stopes, Miss Stopes and Mr. Stopes, jun., on a Daimler car, Mr. Frank Butler on either a motor-tricycle or the Whitney steam car, Mr. H. Swindley, Mr. Crampton on a motor-tricycle, Mr. and Mrs. Edge on their Panhard car, Mr. and Mrs. Heatley on an English-Hurtu car, the Hon. C. S. Rolls on his Panhard car, Mr. C. Jarrott on a Panhard car, Mr. and Mrs. Fuller on a Daimler car, and Mr. C. Cordingley and party. Mr. and Mrs. Blount, Mr. Taylor, Mr. Barr and Mr. and Mrs. Johnson will accompany the party in the Club wagonette.

### In the Midlands.

DURING the past summer the British Motor Touring Company of Stechford has been making a series of experimental motor-wagonette runs around Birmingham. Next season it is proposed to institute a regular service to

places of interest, such as Warwick, Leamington, Kenilworth, Malvern, Stratford-on-Avon, etc. We understand that a dozen members of the county constabulary recently took a trip in the wagonette belonging to the Company, of which Mr. Morrison is the managing director, and—tell it with bated breath—made a pace of eighteen miles an hour. Wicked men; they should have locked each other up!

### Prejudice and Interest.

WRITING to the *Edinburgh Evening News*, "Justitia" says: "The recent decisions in the cases of alleged furious driving on the part of motor-cars call for some notice. The public should watch jealously that justice is done in this connection. The principal evidence was led by tramway inspectors and policemen, who are notoriously prejudiced. It is no secret that these motor-cars are making serious inroads on the tramway revenue in certain districts. This would not be so if they did not give the service the public desire and appreciate. Their success is a reproach to the dilatory methods alike of the tramway company and the Corporation; hence the readiness to prove an offence. No accident has yet taken place with the motor-cars, which is more than can be said for our slow-going, irregular tramway cars. Let me say that I am not concerned in any way with any motor-car company, but I am concerned, as a citizen, in seeing that the city gets the best service, and that without prejudice or injustice to those who have the enterprise to give it."

### Snapshots Wanted.

Now that touring days are drawing to an end, we shall be pleased to receive from readers reminiscences of their wanderings by motor-car during the past summer. Suggestions for tours of a week or fortnight duration, or for week-ends, will be particularly welcome and afford interesting reading, raising anticipations of glorious rides and delightful days next season. If these notes of travel are accompanied with snapshots of interesting spots in which the motor-car figures they will be even more welcome, and, where possible, will be given reproduction in our columns. Outlines of tours, with the names of places where petrol can be obtained and other details, will be valuable to all motorists, and *The Motor-Car Journal* hopes to be the means for the interchange of much useful information of the kind among those who take their holiday vacation on the motor-car.

### Motoring on the Continent.

IN view of the success which has attended the Hon. C. S. Rolls and the Hon. J. Scott Montagu, M.P. with their motor-cars in the Paris-Ostend race, it is probable that many other English automobilists will be induced to cross the Channel with their motor-vehicles. In this connection, Mr. C. Johnson, the Secretary of the Automobile Club, asks us to warn "chauffeurs" who may be taking their cars to France that if they ship them from Southampton to Havre on a Saturday night the vehicles will not be allowed to leave the vessel at Havre until the Monday morning, as the Customs officers whose duty it is to clear such goods are not at work on Sundays. Further, in no case can a heavy vehicle be taken off the steamer until the tide is sufficiently high to permit of the vessel coming alongside the quay, which sometimes involves a delay of six hours. Mr. Johnson, probably speaking from experience, also remarks that "before entrusting repairs to

any firm in France it is always as well to first obtain an estimate from them of the cost of the repairs." There is an excellent automobile firm at Havre where petrol may be obtained, motor-vehicles stored, and repairs effected, viz: Tourand & Co., 34 rue Dicquemare, Havre.

#### On Tyneside.

MR. BLACKLOCK, of the Tyne Motor-Car Co., and Mr. Turvey were the pioneers of motor-car services in the North, and from an interview with the former in a local paper it would appear that great developments are in contemplation. The Tyne Motor-Car Co. has an 8-h.p. car on order which will inaugurate a service to Byker. It is impossible for any of the cars to run at a greater rate than ten miles an hour, the average speed being about eight. Although the business is at present a private concern, it is about to be floated as a company; in fact, the capital is nearly all subscribed. Show-rooms will be opened at Newcastle, and cars will be let out on hire, while it is intended to ultimately undertake the building of cars as well.

#### Motor-Cars and Railways.

SOME of the members of the Dover Chamber of Commerce are evidently gifted with sarcastic tongues, for at the annual meeting of their association it has been suggested that an automobile service should be started in opposition to the railways that are supposed to exist for the convenience of the public who wish to get from London into Kent. Rather far-fetched as the idea may seem, it is a suggestion that will appear quite ordinary and very commonplace to Police-Constable Garner, of Stonehouse, who having hauled a Cheltenham motorist before the magistrates calmly told their worships that the defendant "was going like a train." Evidently Police-Constable Garner would be a useful witness in any inquiry with a view to utilising motor-cars as competitors to the wretched railway systems of the South of England.

#### A Stand for Motor-Tricycles.

WE briefly alluded in our issue of the 25th ult. to the new stand for motor-tricycles which has just been put on the market by the Ailsa Craig Machine Co., Ltd., of East Putney, S.W. We are now able to give an illustration of the stand, which is constructed of wrought iron and steel; it is simply placed below the rear axle and the

foot pedal pressed down, this causing the supports to rise and lift the rear part of the machine clear of the ground. The makers state that a motor-quadracycle fully equipped can be readily raised into position for testing repairs, etc., by means of the new device by a boy. The Ailsa Craig Co. are, we understand, also arranging to supply a stand of this kind adapted for use with motor-cars; the latter will be adjustable, both as regards height and width, and will lift and hold vehicles weighing up to 5 cwt.

#### Waiting.

THE London General Omnibus directors are watching the development of automobilism with interest, and now we learn that the directors of Messrs. McNamara & Co., Ltd., the great contractors for horses for the Post Office, have the matter of motor traction under consideration. The shareholders have been assured that when "the time came for taking active steps the Board would do so." Evidently these great horse-owning concerns are all waiting. Which will make the start?

#### The "Financial News" Again.

THE *Financial News*, whose editor delights in motor-caring on the roads and reviling motor-cars in his paper, has asserted that "the list of accidents has grown so lengthy as to prove very cold comfort to those holding shares in motor-car companies." And it is evidently with a view to chill them altogether that he allows paragraphs relating to accidents, or reported accidents, to appear so frequently without explanation or reason. Why is not every cab accident similarly chronicled, and equal prominence given to the dangers of horse-drawn vehicles? Proportionately, we should say the number of accidents to horse-drawn vehicles and to motor-cars is in favour of the latter; for while casualties to horse-drawn vehicles are of such common occurrence that only a small and insignificant minority are reported, every motor-car stoppage, upset, or accident is reported—and in many cases, magnified and exaggerated.

#### Motor-Cars for Bournemouth.

THE North is not alone in suggesting that motor-car services should be inaugurated in places where efficient tramways do not exist. Now a reader of the *Bournemouth Guardian* comes forward with a suggestion that motor-cars should be adopted on the Ashley and Poole roads instead of tram-cars, as has been proposed. A service of motor-cars from the Pembroke Hotel, Branksome, along both the roads mentioned to Poole would fill a public need, and the pertinent question is asked, Who is to start the Bournemouth, Branksome, Poole and Parkstone Motor-Car Co., Limited? We like the idea, but the title of any concern started for the purpose of serving the public must be shorter than that suggested.

#### More Motor-Car Works.

WE understand that Messrs. Walter C. Bersey & Co. have taken over some works at Willesden, N.W., and that in the course of about two months this firm will place on the market motor-carriages of a new type, propelled either by oil, steam or electricity. As Mr. Bersey has had considerable experience in motor-car work, we shall look forward to an inspection of his new vehicles with interest.

#### Motor Pacing and Cycle Record Breaking.

ON Friday last week Mr. F. R. Goodwin succeeded in establishing a new twelve-hour record for cycles on the road. The total distance covered by Goodwin in the twelve hours was 244 miles, beating E. Gould's tandem-paced 226½ miles, made on practically the same course. The wonderful achievement was in no small measure due to the pacing afforded him by motor-cars and motor-tricycles, assistance in this direction being given by Mr. S. F. Edge on his Panhard car, and such well-known motor-cyclists as C. G. Wridgway, L. Egerton, J. W. Stocks, MacCormack, and C. G. Garrard on tricycles and C. Jarrott, the latter being present on a new double-motored Bollée voiturette. No small amount of excitement was caused in Euston Road,

N.W., one day last week-end when the bulk of the pacing motor-machines left in procession the premises of the British Motor Coupé Co., where they had been stored.

**A "Lifu" Steam Tram.**

On another page will be found a brief account reproduced from the daily papers of a "motor-car" accident at Portsmouth. On enquiring into the matter we find that the vehicle is a steam tram-car built by the Liquid Fuel and Engineering Company, of East Cowes, Isle of Wight, on the lines of their well-known "Lifu" steam cars. The accident was due to one of the points on the line being in a defective condition. The authorities of the line knew of the point in question, but had omitted to acquaint the driver of the "Lifu" car thereof, with the result that the car was jerked off the line, as were also the two trailing cars. Altogether about 120 passengers were on the three cars. Fortunately the accident was attended, beyond the knocking down of a brick wall, with no serious result.

**More Motor-Tricycle Races at the Crystal Palace.**

As briefly mentioned in our last issue, a further motor-tricycle race meeting is to be held on the Crystal Palace track on Wednesday next, the 13th inst., under the auspices of the Motor-Car Club. We learn from Mr. Bailly that the entries are coming in in a very satisfactory manner. A start will be made at 5 p.m. The five mile race for the championship of the Motor-Car Club, with Messrs. Edge, Jarrott and Wridgway riding, is bound to be a very close and exciting one. Besides this race there will be one mile and two mile handicaps, and a five mile handicap for roadster machines, Messrs. Edge, Jarrott and Wridgway being barred. This ought to draw a large number of entries from users of machines not fast enough to compete with path-racing machines who would like to try the speed of their machines on the track. On the conclusion of the races there will be a club dinner for members of the Motor-Car Club and their friends.

**War Office Red Tape.**

THE ways of Government departments are generally dilatory, and when they have the merit of promptitude are not always to be commended from a common-sense point of view. Conspicuously among these departments the War Office is bound up with red tape, and an instance has occurred in connection with the autumn manoeuvres which illustrates the spirit of antiquity which still animates many in high position. Some officers at Aldershot wished to test the capability of the motor-vehicle and to give it a practical trial as an adjunct to military equipment. The experiment would have been interesting and might have proved valuable; but, less enterprising than the Post Office, the military authorities seem to have peremptorily declared against the automobile and its experimental introduction for military purposes. And thus do we keep abreast of Continental nations!

**Another English Daimler Car for Continental Races.**

WE met Mr. Pedley of the Daimler Motor Co., Ltd., on Wednesday, and found him not unnaturally elated at the success achieved by the Hon. J. Scott Montagu, M.P., in the Paris-Ostend race, particularly in view of the fact that the car was not in any way altered as regards the body for racing purposes. We understand that the Daimler Company has an order in hand for a special racing motor-vehicle for participation in the projected race from Paris to St. Petersburg. Mr. Pedley reports enquiries for motor-cars as coming forward briskly, and only a few minutes before we met him he had sold a vehicle at a premium to a Manchester

gentleman who intended driving the same North, starting from London yesterday (Thursday).

**A Motor-Cycling Tournament.**

MESSRS. P. SOUVESTRE & Co., of Liverpool, are organizing a series of motor-cycle tournaments in different parts of great Britain. The entries already include those of the following well-known French motor-cyclists: Béconnais, Osmont, Vasseur, Loste-Dupuy, and Albert, who will leave Paris for England on the 30th inst. The following towns among others will be visited in the order named:—Cardiff, Birmingham, Liverpool, Leeds, Manchester, Newcastle, Edinburgh, Glasgow and London. Arrangements have been made for races on the cycle tracks in each of the towns named, the programme in all cases comprising a one mile international scratch race, a five mile ditto, and a ten mile ditto, prizes being offered for each event. Any English motor-cyclist who is anxious to compete against the Frenchmen in these races should communicate with Messrs. Souvestre.

**The Lanchester Motor in America.**

WE referred in our last issue to the formation of a company at Trenton, New Jersey, to control the American patents of Mr. F. W. Lanchester, of Birmingham. We now learn from the *St. Louis Age of Steel* that "a plant for the manufacture of the Lanchester oil motor, to employ about 600 skilled mechanics, is to be built in Pittsburg. This is the conclusion reached by the incorporators of the Lanchester Motor Company, which was organized a few days ago under the laws of New Jersey, with a capital of £1,000,000. The Company proposes to manufacture Lanchester oil motors, especially for the use of large freight trucks and street cars, though it has recently secured an option on all the oil motor patents in the United States, Canada and Mexico that are owned by the inventor, Mr. F. W. Lanchester, of Birmingham, England, who is a large stockholder in the new concern, and who is expected to visit Pittsburg within the next month."

**Cuénod's Emergency Brake.**

IN our last issue "A Worldling" referred to the emergency brake for motor-cars recently devised by M. E. Cuénod, president of the Swiss Automobile Club, and which is now being introduced by that gentlemen from his offices at 3 Rue Laffite, Paris. The device, of which we are able to give two illustrations herewith, is not intended to replace the ordinary brakes on a motor-car, but is an addition

BRAKE OUT OF OPERATION.

BRAKE IN OPERATION.

thereto, only to be used in cases of emergency. As will be seen, the brake consists of two iron shoes carried near the ground, one at each side, in the space between the rear wheels. These shoes are connected by suitable levers to and are controlled by a handle at the side of the driver. The brake shoes, as will be seen, act on the road and not on any part of the vehicle. It is described as being exceedingly powerful. In addition to acting as a brake the device can be used as a lifting-jack, and can also take the place of a "devil" or sprag.

### The Trans-American Automobile Tour Abandoned.

HARDLY had we gone to press with our last issue when news reached us that Mr. and Mrs. John D. Davis, the adventurous pair who undertook to cross the continent of America in a motor-carriage, and whose mishaps and tribulations have filled the columns of the newspapers of the United States for the past five or six weeks, have decided to abandon the experiment. They reached a point beyond Toledo, O., when fresh troubles occurred, although the machine had been overhauled at Cleveland, O. As the New York *Horseless Age* recently pointed out, at the rate at which they were travelling they could not have reached San Francisco in less than five months from the date of setting out!

### The Stanley Show.

ONCE again this old established exhibition will be held at the Agricultural Hall, Islington, and additional interest will be added by a small show of motor-vehicles. The number, inclusive of all sorts of motor-cycles, will not exceed forty, and these, we understand, will be specially displayed in the Minor Hall. Otherwise the sole privilege of exhibiting motor-vehicles at the Agricultural Hall is in the hands of the proprietors of this Journal, Messrs. Cordingley & Co.

### The Post Office and Motor-Vans.

IN the Blue Book issued on Tuesday by the Postmaster-General, reference is made to the attention now being given by the Postal authorities to the question of the employment of motor-vans for the conveyance of mails, both in London and the provinces. So far, no permanent services of the kind have been established, and the experiments are to be continued. We understand that the attempts already made in this direction have been from Reading to Newbury, Leith to Edinburgh, Paddington to Mount Pleasant, E.C., and from St. Martin's-le-Grand to Redhill. Naturally, the Duke of Norfolk will be extremely cautious before finally deciding on the adoption, or rejection, of motor-vans; for the initial expense of such a service would be very great, and he has to regard himself as the custodian of the Public Purse. There is little doubt, however, that as our manufacturers devote themselves with increased zeal to the designing of motor-vans for heavy traffic and for delivery purposes, the prospects of the employment of automobilism in the postal service will increase, until it eventually becomes *un fait accompli*.

### A Portable Motor-Car Store House.

IT is not every automobilist who has stabling accommodation for his motor-car and probably there are many would-be "chauffeurs" who are deterred from investing in an automobile owing to lack of similar facilities. Messrs. F. Jackson & Co., Ltd., 77 Oxford street, London, W., in introducing a portable motor-car storage house, have therefore filled a want. The storage house we had an opportunity of inspecting on Wednesday is adapted to receive a Benz car; it is constructed of wood, the inside being lined with felt to render it waterproof. The house, which has a ridge roof and two large outwardly-opening doors at the front, measures about 8 ft. 9 in. in length by 6 ft. in width and 7 ft. 9 in. extreme height. The house can be readily taken to pieces, the various parts being held together by bolts, while to facilitate the entry of the car two folding "ramps" are provided. Another feature of the new house is the provision of a work-bench and shelves on which accessories may be stored, small repairs effected, etc. As we have mentioned, the house we inspected was adapted to receive a Benz car, but we understand that Messrs. Jackson are arranging to also construct portable houses of various sizes suitable for any type of motor-vehicle.

### New Works for the Construction of "Lifu" Steam Vehicles.

IN our last issue we referred to the visit of the members of the Institution of Junior Engineers to the works at East Cowes, Isle of Wight, of the Liquid Fuel and Engineering Co., and stated that the capacity of these works was thirty "Lifu" steam wagons and twenty launches annually. The demand for automobiles has, however, recently so largely increased that additional facilities have become imperative. The Company has for some time past been looking around for suitable premises, and we are now able to definitely announce that the extensive works and plant at Adderley Park, Birmingham, recently occupied by the Starley Bros. and Westwood Manufacturing Co., Ltd., have been acquired by the Liquid Fuel Co. The extent of the new works may be gauged from the fact that they cover an area of about 3½ acres, the dimensions of the main shop being no less than 300 ft. by 209 ft. We understand that the existing plant is admirably adapted for the purpose of manufacturing the various parts of steam vehicles, and that operations will be commenced at Birmingham in from six to eight weeks time.

### The Werner Motor-Bicycle.

WE learn that the Motor Manufacturing Company, Ltd., are about to reintroduce the "Werner" motor-bicycle on the market. Several modifications are being incorporated into the new machine, notably the adoption of electrical ignition in place of the incandescent tube formerly used; the motor, too, will also, we understand, be of a slightly increased capacity.

### English-Built Racing Motor-Cars for the Continent.

IN another column we refer to the fact that a special racing automobile intended for the projected Paris-St. Petersburg course and other important races on the Continent is to be built by the Daimler Motor Co. We learn that an informal committee of the Automobile Club has been formed to advise as to the details of this car, which is to be fitted with a twin Daimler motor. Should the car, when completed, answer expectations, it is contemplated to forward a challenge to race for the International Automobile Cup recently instituted by Mr. Gordon Bennett and lodged by him with the French Automobile Club.

### Motor-Cars in Australia.

MR. E. W. RUDD, head of a large cycle importing house in Melbourne, has just returned home after a business tour in Europe, in the course of which he paid a visit to the recent motor-car exhibition in Paris. One result of his trip is to be found in an announcement made by an Australian contemporary that Mr. Rudd has four motor-cars of the latest design already on the way out to Melbourne. No information is so far available as to the type of car which Mr. Rudd is introducing into the Antipodes.

### Motor-Car Construction in Canada.

A STRONG syndicate of capitalists in Toronto has just acquired four of the largest cycle manufacturing concerns in Canada—viz., the Massey-Harris Co., Toronto; H. A. Lozier & Co., Toronto Junction; the Goold Bicycle Co., Brantford; and the Welland-Vale Co., St. Catharines. These concerns, which have a productive capacity of 30,000 bicycles per year, are to be amalgamated and extended. It is also the intention of the new Company to manufacture automobiles. In the course of an interview one of the leading members of the syndicate is reported to have stated: "We have been following this line of the business up in order to be able to turn out a good article, and we are of the opinion that a good bicycle manufacturing firm can, with a little additional

plant, turn out a good automobile. At present it costs from £300 to £400 to buy an electric motor-cycle or automobile; but it is thought that our Company will be able to put these popular machines on the market much cheaper, so that they will come within the reach of men of moderate means. "We will probably make them smaller, and therefore less unwieldy than those at present in use." It remains to be seen whether the new Company will carry out the programme above outlined.

#### The Dover Show.

WE learn from Mr. F. E. Beeton, the secretary of the forthcoming motor-car exhibition at Dover, that the show promises to be very successful. Among the firms who have taken space may be mentioned the Liquid Fuel

Engineering Co., the Steam Carriage and Wagon Co., the Clarkson & Capel Steam Car Syndicate, the Automobile Association, Ltd., Messrs. Gibbons Bros., the British Motor-Coupé Co., Messrs. Shippey Bros., Messrs. Mackenzie & Co., Messrs. Hewetsons, Ltd., Messrs. G. Harding & Co. and the National Motor-Carriage Syndicate (Joel), besides private owners, of which several have taken space. Stands have also been taken for T. Messenger's boiler, C. T. Headech's motor and the Buffoline noiseless gear, while two, if not three, French manufacturers will exhibit. Races will be run on Wednesday certainly and probably on the Tuesday and Thursday, in which, among others, Messrs. Edge, Jarrott and Wridgway have promised to take part.

#### Motor-Car Touring in the Eastern Counties.

WE had a visit from Mr. Chas. H. E. Rush, of the London Autocar Co., on Monday, when he kindly gave us an interesting resumé of his recent trip in the Eastern Counties on a Hurtu car, in company with Mr. Giles, of

King's Lynn. Mr. Rush left London on Monday, the 21st ult., the first day's journey being brought to rather a sudden termination at Hatfield Peveril. As details of the accident which occurred at this place were given by Mr. Rush in his letter published in our issue of the 25th ult. it is unnecessary for us to refer to it again, except to state that a stop was made at Hatfield Peveril until Wednesday morning, to allow Mr. Giles to recover from the shock and to permit of the necessary repairs being made to the car. It is remarkable that although the car was brought to a sudden stoppage and turned right over, so little damage was done to the vehicle, the repair bill amounting to only thirty-five shillings. The repairs completed, Mr. Rush and his friend set out on the car on the morning of Wednesday, the 23rd ult., for King's Lynn, which place was duly reached after an enjoyable run. The following day, Thursday, was devoted to a trip to Wisbech and back, and Friday was spent quietly in King's Lynn. On the Saturday a start was made for Yarmouth, where the week-end was spent. So well did the car behave on this journey that Mr. Rush informs us he made a continuous run of 68 miles without dismounting from the seat. Excellent as was this performance, it was eclipsed on the following Monday, when Mr. Rush returned from Yarmouth to London, *via* Norwich, the distance—142 miles—being covered in 9½ hours, equal to an average of 15 miles per hour. On some of the good roads in the neighbourhood of Newmarket some very fast travelling was recorded, thirteen miles being covered in thirty-five minutes. Mr. Rush has returned home with a very high opinion of the Hurtu car for touring purposes. He reports having had no trouble whatever with the pneumatic tires, nor any difficulty in procuring petrol, etc., during the course of his tour.

THE Mobile Co. of America, who are building a factory at North Tarrytown, N.Y., for the manufacture of Stanley steam cars, are pushing the erection of their plant with all possible energy, and expect to be turning out carriages this autumn.

## JOTTINGS BY A WORLDLING.

I SEE that a correspondent in a letter which appeared in last week's *Motor-Car Journal* asks for advice as to the dressing of his "man." I think he will find the following satisfactory: Yachting cap of grey cloth with a band of blue, black, green or whatever his livery colour is; single-breasted, square-cut coat of grey cloth with a "stand-up" coloured velvet collar bordered with white silk cord; plaited epaulettes—livery colour; breast pocket with V-shaped flap bordered as the collar, with a small silver livery button matching the larger ones which fasten the coat; and side pockets without flaps. The trousers should have a stripe down them of the same material as that used for the hat band. My own mechanician is thus appareled.

It is with great personal sorrow that I have to record the death "ere his prime" of Ernest Renshaw, who was so long famous for his lawn-tennis playing. Latterly he had taken keenly to automobilism; hardly a day passed that was not in part spent by him in driving one or other of his cars. He joined the Automobile Club about two months ago. I knew him, as indeed did many people, as a kind friend, with a quiet, reserved nature: one who did much good, and always tried to hide the doing of it. I feel that all good "chauffeurs" will grieve with me at the loss of one of the best and most enthusiastic of our young band.

WE can ill afford to lose such a man as this: by "we" I mean all those who are trying to establish automobilism on a sporting basis in England. The fact of Ernest Renshaw's saying that driving a motor-car was "rare sport," made many men turn their attention to it. Among these was another great lawn-tennis player, the present champion, Mr. "Reggie" Doherty, who has bought a De Dion tricycle, which he learned to ride round the track at the Queen's Club, under Renshaw's tuition. Another member, Mr. West, who married that popular artiste, Miss Mimi St. Cyr, did likewise; and so the snowball was started.

AT the time of his death, poor Renshaw had two cars—an electric phaeton built by that able young engineer, Mr. Eric Clift, and a petrol Victoria by the International Motor-Car Company. The former was seen for a few days at the Agricultural Hall Show, where it had a great success; the latter, which has since proved a good car, began its career ignominiously with the firing of a wheel on the road to Ranelagh on a Saturday afternoon in the middle of the season: so that not only the *profanum vulgus* but all London's "dandies and beauties" jeered as they passed by. I happened to arrive on the scene just as the Duke and Duchess of York drove past in a hansom; they more than smiled.

THE other day I persuaded a friend to buy a motor-tricycle. He got on splendidly with his first lesson—so well, indeed, that he was able to ride home across the park. But imagine my astonishment when at the break of the following day I got this wire from him: "Have left mixture on all night. Does it matter?"

JUST as we go to press we learn that the Hon. J. Scott Montagu, M.P., has entered for the Paris-Boulogne race, which is to take place on the 17th inst. Mr. Montagu will drive his twin-Daimler car, but is, we understand, having a special racing-body constructed for the coming race.

## The Paris-Ostend Race.

BY reason of the entries of the Hon. John Scott Montagu, M.P., and the Hon. C. S. Rolls, both of whom were competing for the first time in a French automobile race, the "course Paris-Ostend" was of special interest to all British automobilists, and I can readily picture how eagerly each phase of the race was followed and with what anxiety the result was awaited at Whitehall Court and other centres of automobilism. Here in Paris, ever since we English motor-men had learned that the Old Country would be represented, the possibilities of victory had been discussed again and again, and the unanimous opinion was that while the prospects of a win were of the best, win or lose we could

between the racer and the stylish wagonette so well known in London.

As the conditions ruling the tourist class only stipulated that each car should carry four persons, Mr. Rolls had wisely decided to discard his wagonette body and utilise instead a small aluminium two-seated body, the additional passengers being carried on a basket at the back of the car. Other competitors had followed the same plan, but Mr. Montagu ran his car exactly as he uses it for touring purposes, that is to say, fitted with a heavy six-seated body, and this undoubtedly severely handicapped him. His car is a production of the Daimler Company, and is throughout of excellent

MOTOR-CYCLES LINED UP JUST BEFORE START.

BROC'S MORS CAR (NO. 11) AND GEORGES' PEUGEOT CAR (NO. 10).

LEMAITRE (NO. 1), GIRARDOT (NO. 2), AND CHARRON (NO. 3) PREPARING TO START.

LEMAITRE'S PEUGEOT CAR.

not be more worthily represented. Two of our most enthusiastic and most accomplished "chauffeurs," driving respectively a magnificent English Daimler car, and an equally good French automobile! What more could one desire? Of the two representatives, Mr. Rolls was the first to arrive in Paris. Accompanied by Messrs. Bird and Millership he came over *via* Southampton and Havre, incidentally putting in some very fast times *en route*. Of course, he drove his well-known 8-n.h.p. Panhard, but comparatively few English autocarists would have recognised the car under racing canvas. Every atom of superfluous matter had been dispensed with, and one could see little resemblance

construction. It is fitted with two 4-n.h.p. motors, which jointly develop 12 h.p. on the brake. Ready for the road the vehicle weighs about 24 cwt., aluminium having been employed wherever possible. A feature of the construction is the possibility of feeding the burners by pressure or by gravity, as may be desired, the engine itself being of the gravity-feed type. Mr. Montagu was delayed at Havre, the Customs declining to clear the car on a Sunday, but eventually he reached Paris on the evening preceding the race. He was accompanied by Mr. Claude Johnson, a friend, Mr. Mayer, and an engineer, and also carried a quantity of luggage. Despite this heavy load he made some fast times,

the best being an average of 33 miles per hour over a run of 9 kilometres. On the morning of the race Mr. Rolls and his three passengers, viz., Messrs. Johnson, Staplee Firth, and Bird, went out to St. Germain at a very early hour, but it was not until nearly 8 o'clock that Mr. Montagu's car left the stable to traverse the 23 kilometres of truly villainous road which lies between Paris and the departure "contrôle" at St. Germain. I accompanied the car, and after a slow and weary journey we reached the scene of departure a short half-hour before the signal was given, only to find that *en route* a water-circulation tube, repaired at a Parisian dépôt the previous evening, had again given way. Was there ever such terrible luck? Our hopes dashed to the ground even before the race was started! A hurried disconnection of the tube, a frantic search for a workshop ultimately crowned with success, a trying explication of our requirements in imperfect French, a maddening wait while the work was carried out, and then back to the car to effect the attachment.

This final operation and the refilling of the water tank took considerable time to complete, and when at last the car

any rate one English company can turn out cars capable of holding their own with Continental productions. The official times were: 1, Creux, 5 h. 14 m.; 2, Maréchal, 5 h. 33 m.; 3, Rolls, 5 h. 35 m.; 4, Charles, 6 h. 38 m.; 5, Montagu, 7 h. 17 m. Of the other two competitors, the B. G. S. (electric) broke a spring after covering 56 kil., and although eventually continuing the journey, arrived too late for classification. The other car, that of M. Charbonnier, met with an accident at Achères, and abandoned.

The motor-cycles and the voituresses finished as follows:—Cycle: Ollier, in 3 h. 54 m.; Seignol, in 4 h. 19 m.; Jeanbert, in 4 h. 21 m. 38 s.; Courmont, in 4 h. 25 m.; Cormier, in 4 h. 51 m.; Echard, in 4 h. 55 m.; Mary, in 6 h. 15 m.; Riguelle, in 7 h. 4 m.; Caldas, in 8 h. 25 m.

Voituresses: Théry, in 4 h. 23 m.; Gabriel, in 4 h. 31 m.; Uhlman, in 6 h. 21 m. 25 s.; Bilhouet, in 8 h. 5 m. In the latter class the first three arrivals were Decauville cars. As each only carried one person they could not be said to be actually in the race, as the regulations for this category stipulates that each vehicle should have two persons on board.

E. GEORGES' PEUGEOT CAR.

LEMAÎTRE, GIRARDOT, AND CHARRON LINED UP READY TO START.

FLASH'S VALLÉE CAR (No 6).

GIRARDOT ON HIS PANHARD CAR.

went spinning down the road the delay had amounted to more than two hours—a truly inauspicious start. As for the other racers—well, I was too busy to look after them, but I understand that the six cars, twelve motor-cycles, and eleven voituresses, were all despatched together, a method of starting which I consider to be the height of folly. The small fry should indeed be grateful to the drivers of the large cars that they escaped with their lives. During the evening I was rejoiced to receive a telegram from some kind friend at Saint Pol to the effect that *Mr. Montagu's net time was 4 h. 58 m., or 16 m. less than that of M. Creux, who was first.* A fine showing indeed, and one that ought to satisfy all automobilists that at

The following morning I again went out to Saint Germain to witness the departure of the racing section of the "course." The start, although not affected in quite so dangerous a manner as that of the previous day, was bad enough, the nine competing cars being despatched together, followed by the twenty-four motor-cycles after a two-minute interval. The cars were those of Lemaître (Peugeot), Girardot (Panhard), Charron (Panhard), Jenatzky (Mors), Flash (Vallée), Levegh (Mors), Georges (Peugeot), Broc (Mors), Perrot (Mors), and they were lined up across the road in three rows. Levegh was in the second row, but before half a kilometre had been traversed he had in some extra-

ordinary manner forced his way to the front, hotly pursued by Charron and Girardot. For the others following it must have been almost impossible to have seen five yards ahead so terrible was the dust, and the entire absence of accidents is something to be wondered at.

In the case of the motor-cycles, the same trouble and danger from the dust occurred, and undoubtedly a less dangerous method of starting must be initiated ere long. In order that some comparison of the speeds attained by the leading tourist and racing automobiles may be made, I append the following times occupied by them in the journey to Saint Pol:—Cars: Tourists—1, Creux, 5 h. 14 m.; 2, Maréchal, 5 h. 33 m.; Racers—1, Levegh, 3 h. 23 m. 45s.; 2, Girardot, 3 h. 32 m. Cycles: Tourists—1, Ollier, 3 h. 54 m.; Racers—2, Test, 3 h. 22 m. Two hours and a quarter after the racers had left Saint Germain the signal of departure was given to the tourists at Saint Pol. The distance between that town and Ostend is 136 kilometres, and it was hoped that on this handicap the leading automobiles in each class would arrive more or less together. And this estimate was fairly correct, as will be seen from the times of arrival given below.

## TOURISTS.

| Cars.      | Time of arrival at Ostend. | Time, Paris-Ostend. | Place. |
|------------|----------------------------|---------------------|--------|
| Creux ..   | 3 h. 10 m.                 | 8 h. 24 m.          | 1      |
| Rolls ..   | 3 h. 16 m.                 | 8 h. 51 m.          | 2      |
| Montagu .. | 3 h. 27 m.                 | 10 h. 44 m.         | 3      |
| Chales ..  | 4 h. 13 m.                 | 10 h. 51 m.         | 4      |

Mr. Montagu's time, less delay at start, was thus 8 h. 35 m., or only 11 minutes more than the winner, over a course of 322 kilometres.

As may be imagined the "dead heat" of Levegh and Girardot was sensational in the extreme—indeed it was the feature of the race. Accidents and incidents were not numerous, the only serious mishap occurring to the motor-cyclist Marché, who ran into the kerb at Conflans and was thrown violently against a wall, receiving very serious injuries. I send you a number of photographs taken at the departure of the racers from Saint Germain, and regret that I was unable to obtain pictures of the cars of Mr. Montagu and Mr. Rolls.

ERNEST M. C. INSTONE.

## MIDLAND MOTOR NOTES.

By "HERCULES."

## Cycle Manufacturers and Motors.

JUDGING from a tour of inspection over a number of cycle factories in the Midlands, the inquiries firms have received, and the rapid strides the motor industry is making, I have not the least doubt that this time next year most of the cycle houses will have made a serious start in the manufacture of motor-cars and motor-tricycles. For the lighter type of vehicle, the experience firms have had in the development of the cycle trade will be most valuable, and, with their connection with agents throughout the country, should materially assist in placing their motor business on a sound basis and help to smooth over any difficulties which may arise between supply and demand.

## English Workmanship.

SEVERAL firms find themselves with numerous orders on hand before their arrangements for turning out a complete motor-machine are in perfect order. At the present time, however, it is the thorough organization of their resources which is required to enable firms to compete with the orders which are being steadily received. The excellence of English workmanship compares most favourably with that of our Continental friends. Indeed, the writer is acquainted with several men in the trade who have been running Continental motor-machines for some time, who are thoroughly convinced that the workmanship is far below that of English productions.

## A Motor Parcel-Delivery Service.

IN Leicestershire a motor-carriage has for nearly a year been meeting all the requirements incidental to a carrier's business. The vehicle runs between Hinckley, Sharnford and Leicester.

## The Ariel Motor-Tricycles.

I HAD a long conversation with Mr. Charles Sangster, the general manager of the Cycle Components Manufacturing Co., Componentsville, Birmingham, last week, and in taking a tour of inspection through the works was greatly surprised to observe the extent to which this company have entered into the manufacture of motors, motor-tricycles and quadricycles. Judging from general appearances, I should say there can be no doubt that the Components Co. have so thoroughly organized their works that they are able to turn out motor-tricycles with the greatest expedition. It will be remembered that the Cycle Components Manufacturing Co. had previously gone in for the manufacture on a large scale of cycles, and this fact materially assisted them in organizing so rapidly and effectively to cope with the new industry. I may add that this firm are not troubling themselves much about carriages, but are devoting their energies almost exclusively to the perfection of a motor suitable for motor-tricycles and quadricycles. They are issuing a neat list containing prices of motors on the "Components" De Dion system, and are turning out a large number of Ariel motor-tricycles weekly. They have greatly improved their motor during the last few months, and have made a very liberal offer to their old customers. This is, in effect, that if customers will send their machines to them, paying carriage both ways, they will convert the old motor into an up-to-date appliance. There can be little doubt that the Components Company have hit upon a motor which for its size is exceedingly powerful. Whilst I was at the works an engine was being tested, and its capacity was no less than 3,170 revolutions per minute. On a track a tricycle driven by this powerful little engine would be capable of doing close upon forty miles an hour.

**An End-to-End  
Motor-  
Tricycle  
Ride.**

MR. SANGSTER informed me that, should the weather improve, Mr. J. W. Stocks will probably take on at an early date a tour from Lands End to John O'Groats. After his ride of 482 miles within the twenty-four hours, Stocks

considers he ought to do the distance of about 860 miles in two days if favoured with good weather. The only difficulty in the way of bringing the venture to a successful issue is the want of a thorough knowledge of the roads, and all riders know what this means. I also understand that Mr. C. G. Wridgway will accompany Mr. Stocks on his long ride.

**The Daimler  
Co.'s Car on  
the Continent.**

THE Daimler Co. at Coventry are naturally very jubilant over the Hon. J. S. Montagu's success on one of their motor-cars in the Paris-Ostend race. This rider came in third, but had he started at the same moment as

the winner there would have been an exciting finish, the times being identical.

**More  
"Optical  
Illusions."**

It was only the other day that a magistrate, when hearing a summons against a motor driver for furious driving, expressed the opinion that people seemed to suffer from an illusion in regard to the speeds at which these

vehicles covered the ground. Mr. J. Grose, who keeps a motor-carriage depot at Northampton, has experienced the truth contained in this observation. He related to me the other day, with quiet humour, several of his experiences. Thrice has he been fined for furious driving, but on neither occasion was he exceeding the pace which is allowed by law—twelve miles an hour. Twice he employed counsel to defend him, but his version of the affair did not appeal to the magistrates trying the case. On the third occasion Mr. Grose—shrewd man—pleaded guilty, and mildly asked what there was to pay. And this, whilst he knew that his vehicle had been proceeding at the modest rate of six miles per hour! A horse had, however, become frightened by his motor, and had bolted, which had caused the inevitable crowd to assemble. Mr. Grose thinks he will plead guilty at once should he again have the misfortune to be the victim of somebody's too imaginative mind and find his way into a police-court. It pays: there is not only less worry, but one comes out of the ordeal often with more cash in one's pocket than would otherwise be the case. At least, this was Mr. Grose's experience, for at the third time of pleading the fine was only half as much as on either of the two previous occasions.

**The  
Midland Motoring  
Centre.**

DURING the past week quite thirty motors have put in an appearance at the Stonebridge Hotel. Stonebridge is a noted gathering-place of cyclists in the Midlands. It is situated midway between Birmingham and Coventry,

and on a road which, though somewhat hilly, is the favourite resort of riders of both cities. The surface of the road is invariably in excellent condition, whilst the scenery is delightful. The front of the hotel is often a sight worth seeing on a Saturday afternoon or Sunday morning; the greatest animation prevails, cyclists coming and going in crowds, whilst cycles of all makes and grades find support against walls and fences and anything else which lends itself to the occasion. The manager of the hotel is Mr. E. Oxborrow. Himself an old cyclist and of some repute as a racing man, Mr. Oxborrow has proved a friend in need to many a belated and troubled cyclist. Nor has he forgotten to keep a stock of all oils and materials suitable for repairing temporary breakdowns of motors of any description, whether cars or tricycles.

**The Motor  
Manufacturing Co.,  
Ltd.**

THE Motor Manufacturing Co., Ltd., Coventry, are exceedingly busy at the present time, and do not anticipate any slackening off during the coming winter months, as they are so much engaged on the manufacture of vehicles for public hire to run in competition with trams and omnibuses, etc. These vehicles are being fitted with the Company's patent canopy, and are specially designed for winter use. The firm are receiving innumerable inquiries for the Iden "Princess," car to carry two. These cars are now coming through the works in large numbers, and appointments are being daily made so that probable customers and inquirers may have the opportunity of participating in the various road tests. Two cars of this description were run a distance of fifty miles last Saturday on give-and-take roads and came through their trial spin most satisfactorily. A large *chars-a-banc* is also in course of construction, capable of carrying from sixteen to twenty passengers. When finished I am promised a trial run. The Company are also very busy in turning out their 2½-h.p. De Dion motor, which they are supplying to local and other firms. Taken all round this Company appear now to be thoroughly well organized and fully equipped for coping with the demands that are doubtless increasing week by week and month by month.

**The Eadie  
Motor-Cycles.**

AMONGST the cycle firms which are going seriously into the motor trade the Eadie Manufacturing Company are undoubtedly in the front rank. I spent two hours the other day with the works manager, Mr. R. W. Smith, in going over their factory and enjoying a spin on a motor-quadracycle, an admirable specimen of the type manufactured on the premises. A great deal of thought has been bestowed on the construction of this vehicle, and the results are most satisfactory. The front seat is insulated with springs to minimise the vibration due to the inequalities of the road, and a back spring—simple in design but very effective—is also introduced. Another thing which often produces feelings not exactly pleasant is the position a vehicle is sometimes in owing to the convex shape of our roads. One side of the car may often be several inches lower than the other, and the result is a rocking of the body of the machine. Messrs. Eadie have hit upon an admirable device for preventing this being felt by riders on their "quad." The machine is in very great demand, I am informed, but the factory is so well organized that the Company are in a position to turn out quite a dozen each week, in addition to a large number of motor-tricycles. The frames only can be obtained, or the "quads" complete with motor.

**A Trip on an  
Eadie Motor-  
Quadracycle.**

THE motor-quadracycle that I rode the other day, although only 2½ h.p., climbed some of the stiff hills for which the neighbourhood of Redditch is noted. The engine made very little noise in its working—a fact which the public are likely to appreciate—and the whole machine impressed me as being splendidly made and very pleasing in appearance. The Eadie Manufacturing Company are chain and parts makers, as well as cycle and motor manufacturers, and one would scarcely credit that such a difficult place to get at by rail as Redditch is would be such a busy centre. Mr. R. W. Smith has charge of three different factories there, which are practically under the same management. Mr. Albert Eadie is one of the keenest commercial men in the trade, and the combination of his business aptitude with the mechanical genius of Mr. Smith places the firm, as I have said, in the front rank. Motor-chain making is very successfully undertaken by the Company, and they produce an article which is well nigh unbreakable, as shown by the test report given in these columns a week or so ago. Altogether the Company are experiencing a very busy time. They have

taken a large space for the forthcoming Exhibition at the Agricultural Hall, and evidently mean to maintain a foremost position as manufacturers of motors.

#### Improvements in the Grappler Tire.

THE New Grappler Tire Co., of Great Charles Street, Birmingham, have recently made great improvements in the process of manufacturing their tire for motor-vehicles, and they claim that the article now produced by them possesses the qualities which go to the making of an excellent tire—reliability, durability, and ease of manipulation. They have been fitted to cars weighing 25 cwt., and have given satisfaction. Although the Company have only recently taken up the manufacture of motor tires they have received orders from a large number of firms.

#### The Motor-Car Club.

CONSIDERABLE progress is being made by the various branches of the Motor-Car Club. The Birmingham Branch, of which Mr. J. W. Stocks is hon. secretary, has already a good number of members. So much interest was taken in the race meeting recently organized by the Club that it has determined to hold another shortly. Another branch likely to be heard of a good deal in the future is the Eastern Counties one. This has for secretary Mr. Frank Morriss, the well-known motorist, and thanks to his energetic management members are coming in very fast. A branch is in course of formation at Coventry with Mr. A. MacCormack as secretary, and from the number of promises of support received by that gentleman this bids fair to be a great success.

THE Compound Hydro-Carbon Motor Syndicate, Ltd., Luton, is being voluntarily wound up.

THE chief of the Repairs Department of Public Buildings, Boston, Mass., is now using a Stanley steam car in making his rounds.

A NEW firm has just been formed at Marseilles (105 Avenue du Prado), under the style of Berard and Co., to deal in motor-cars, etc.

THE Pittsburg Motor-Vehicle Co., Pittsburg, Pennsylvania, has been reorganized under the name of the Auto-Car Co., with a capital of £200,000.

THE Pfalzische Nähmaschinen & Fahrraderfabrik (Kayser Gebrüder), of Kaiserslautern, Germany, is reported to be taking up the construction of automobiles.

ONE of the latest converts to automobilism is Dr. Muter, F.C.S., F.I.C., of Horley, and Public Analyst for the Lambeth Vestry, this gentleman having just purchased a "Hurtu" car through the London Autocar Co., of Gray's Inn Road, W.C.

It is announced that Messrs. Henderson Bros., carriage builders, of Somerville, Mass., have secured the American patent rights in the electric vehicles of M. Jeantaud, of Paris, and they will establish works for the production of carriages under these patents.

AMONG the American cycle manufacturers who are at present experimenting with the motor-vehicles are: Messrs. E. C. Stearns & Co., Syracuse, N.Y.; the Kensington Bicycle Co., and the Geo. N. Pierce Co., Buffalo, N.Y.; Acme Manufacturing Co., Reading, Pa.; and the Gormully and Jeffery Manufacturing Co., Chicago, Ill.

ELWOOD HAYNES and E. L. Apperson have completed an automobile trip from Kokomo, Ind., to Brooklyn. The distance travelled was said to be 1,050 miles, and was covered in twenty days, only about ten of which were occupied with actual running. This is the longest automobile trip on record in the United States.

## CORRESPONDENCE.

### THE CINEMATOGRAF ON TOUR BY MOTOR-CAR.

TO THE EDITOR OF *The Motor-Car Journal*.

SIR,—To resume a brief account of my tour, which I fancy may be of interest to your readers, I may commence by stating at the outset that my anticipations of success have been more than fulfilled. The motor-wagonette is the greatest and most effective advertising medium that I ever had in connection with my entertainments. On the opening night at Burgh-by-Sands the house was packed, and Bowness-on-Solway, Abbeytown, Mealsgate, Ireby, Silloth, Dearham and Egremont, Cumberland, all tell the same tale. A glance at the map will show that these places mentioned, followed in the rotation given, will mean a zig-zag and circuitous route, but the booking of dates to fit makes this compulsory, and many steep and stony side tracks different to the ordinary highway have to be negotiated. We always make an early start, and, arriving early at our destination, have ample time to "wake the people up" with trumpet and leaflet, and everybody's talk is of the wonderful "motor-car." An insufficient knowledge of the road on Wednesday last gave us a splendid sample of what my car can do. In journeying from Bowness-on-Solway to Abbeytown, by an error in missing a turn in the road we came right on to the marsh at Kirkbride, which is twice every day completely submerged by the tide, and some very high tides having been experienced there recently, it presented the appearance of a veritable quagmire. A farmer near told us that was our way, and although the road (*sic*) was nothing but muddy sand we determined to essay it. I was nervous at one time as to whether we should accomplish it, but slowly and surely we ploughed through it, the mud and sand nearly reaching the hubs of the axles. For 200 yards or more on one side of the bridge that crosses this armlet of the sea, and for 150 yards the other side, the almost living motor struggled gamely on, and at last we were on *terra firma* again. I remarked to my driver, Mr. Sinclair, that we ought not to run such risks, and he proudly replied, "But look, what a splendid test it has been!" And so it was, for with ourselves and my pianist, Mr. T. N. Lax, and our baggage we had not an ounce less than 14 cwt. on the car, and I am quite proud of the achievement. We have mounted some of the steepest "brows" in this county of Cumberland I ever saw, notably the famous hills at Ireby—Boltongate and the well-known (in this district) Leegate brow. On Monday, *en route* from Silloth to Dearham, we passed a Leyland steam motor belonging to Carr & Co., Ltd., of Carlisle, and exchanged hearty salutations. To-day, in passing through Maryport, Workington, and Whitehaven, we were quite an attraction, judging by the crowded streets in our wake. We have been snapshotted several times, and I hope to be able to send you a copy of one taken by Mr. W. Dacre, of Silloth.

Yours, etc.,

T. J. WEST,

Egremont, Cumberland,  
September 5th, 1899.

Manager, "*Modern Marvel*"  
Co., Ltd. (of Edinburgh).

### THE COMING MOTOR BOOM IN ENGLAND.

TO THE EDITOR OF *The Motor-Car Journal*.

SIR,—Doubtless many of your readers are fully informed of the progress of motor matters in France and on the Continent generally, as the perusal of your columns and of those of some of the daily papers will have done much to enlighten them. Several leading firms in Paris and its neighbourhood have orders in hand for which they cannot give delivery under from sixteen months to two years, while Messrs. De Dion & Bouton, the firm which has made the manufacture of light motors for tricycles its leading line, are reported to have no less than 14,000 of such motors on order. To sum

up the general situation there, the industry, which has only been some five or six years in existence, is already giving employment to about 100,000 men, and in another year or two bids fair to rank as the premier industry in France.

While not begrudging the deserved success which has rewarded the enterprise our neighbours have shown, I think I may claim for this country that by the end of the year 1900, or at any rate in 1901, we shall have made up for the loss of time caused by legislative restrictions, which kept us from entering the field until about three years ago, a restriction which seriously handicapped us in the race for business, and enabled our rivals in France, Germany, and the United States to get a long start of us. Every day new manufacturing firms are entering into the motor-car business, and some of the Coventry firms who have been longest in the field have orders in hand for months ahead. For lighter cars, such as the Pennington, I understand there are no less than eleven engineering firms engaged, and yet the demand exceeds the output, although this state of things will probably be remedied later on, when all these concerns are in full swing. Speaking of Continental orders reminds me that the Daimler Company and the Motor Manufacturing Company have both sent cars to the Continent, which speaks well for the work of British manufacturers, while the Prince of Wales, notwithstanding the inducements which were held out to him to use a foreign make of car, has given his patronage to an English firm.

When the history of the motor-car industry comes to be impartially written, I think it will be generally recognised that a good deal was due, in the early stages, to the enterprise of Mr. H. J. Lawson, who, before the merits of the new method of locomotion were generally recognised, stepped into the breach, and at great expenditure purchased some of the best motor patents, and set up works in order to introduce motors into this country.

40 Holborn Viaduct,  
London, Aug. 31st, 1899.

Yours faithfully,  
CHARLES JARROTT.

#### THE DURABILITY OF MOTOR-TRICYCLES.

TO THE EDITOR OF *The Motor-Car Journal*.

SIR,—I have learnt considerably about various cars by perusing your columns. There is one point, however, upon which you do not seem to have touched, and that is durability.

I am hesitating about the purchase of a motor-quadracycle—De Dion or other good make—and whilst I could afford the original outlay, I am anxious to ascertain whether I could equally afford the upkeep. The question of depreciation is therefore of great importance. Could you or any of your readers, in a forthcoming issue, give some authentic information on the lives of the smaller class of motor-cars?

44 Westover Road,  
Wandsworth Common, S.W.  
September 4th, 1899.

Yours faithfully,  
A. G. JONES.

THE Pendleton Rubber Co., Ltd., Edinburgh, is being voluntarily wound up for the purpose of reconstruction.

THE City Motor-Car and Carriage Syndicate, Ltd., has commenced a service of motor-cars between the Monument and Spital Tongues, Newcastle-on-Tyne, commencing at eight o'clock each morning.

WE learn that the British Motor-Coupé Co. has secured the sole right to run motor-vehicles for hire in Dover during the course of the forthcoming exhibition, and is arranging to send down a fleet of vehicles for the purpose.

REFERRING to the letter in our last issue signed by "Physician," Mr. C. Johnson, the Secretary of the Automobile Club, asks us to mention that the judges at the Automobile Club Show at Richmond awarded a diploma of merit for a uniform for an automobile servant which was exhibited by Messrs. Morgan & Sons, of 81 Palmerston Road, Southsea.

### THE MORISSE PETROLEUM-SPIRIT MOTOR-VOITURETTE.

THERE are several novel features in the little two-seated petroleum-spirit motor-carriage exhibited at the recent exhibition in Paris by Messrs. P. Morisse & Co., of Boulevard St. Michel, Etampes (Seine-et-Oise), France, and of which an illustration is given herewith. The body of the vehicle, as also the motor and the motor-mechanism, is carried on a frame, the latter being supported on the axles by means of springs, this method, it is claimed, not only reducing the vibration of the motor, but also that due to the inequalities of the roads traversed. The sides of the body of the carriage are fitted with perforated metal panels, these being adopted to permit a free circulation of air to the motor. One of the novel features of the carriage is that the power of the motor is transmitted to the front road wheels, while the steering is effected through the rear wheels, which are mounted on short vertical pivots, by means of a small hand-wheel to the right of the driver.

The motor employed is of the horizontal petroleum-spirit type; it is capable of developing about 3 h.p. at 800 revolutions per minute. The cylinder is fitted with radial discs for cooling purposes, while the ignition is by means of an electric

THE MORISSE MOTOR-VOITURETTE.

spark. The motor, which is located in the rear portion of the carriage, transmits its power through one or other of three pairs of spur wheels—three speeds, 6, 15, and 24 kilometres per hour, being provided—to an intermediary shaft. The latter also carries a chain wheel which is connected by a chain to another sprocket surrounding the differential gear on the front road wheel axle. To enable the transmission mechanism to be put out of gear a friction clutch mechanism is adopted. With the variable speed gear provided, and by varying the number of electric sparks, the makers claim that they are able to run their vehicle at any desired speed up to 30 kilometres (18½ miles) per hour. The speed-varying lever, the friction-clutch controlling lever, and the handles controlling the carburettor and the electrical ignition are all placed within convenient reach of the left hand of the driver. The vehicle is fitted with wheels of the cycle type, 65 mm. in diameter, and pneumatic tires. The width between the wheels is only 95 mm. (3½ ft. 1 in.), but the makers claim that by reason of the front-driving arrangement and the low centre of gravity the vehicle is perfectly stable, and that it can turn in a circle of only 14½ ft. in diameter. The motor can be set in operation, from the driver's seat, by means of a small hand-wheel, not shown in the illustration. The carriage complete only weighs a little over 3 cwt.

## MOTOR-CARS ON THE CONTINENT.

### Recent Motor-Cycle Races on the Continent.

ON August 27th a motor-cycle race of 100 versts was decided on the roads in the vicinity of St. Petersburg. The weather was magnificent, but the route proved very heavy owing to the recent rains. All the competitors rode machines of French construction. The winner was M. L. Masi, who completed the distance in 2 h. 43 m. 33 s., and he was followed home by Cournel, Merle, Simon, Jansky, Kinsky and Babkin in the order named. On August 28th, at Kiel, a 4,000 metres race for motor-cycles was won by Niebuhr and Münster, riding a tandem. Their time for the distance was 5 m. 4 s.

### Automobilist Mulcted.

THE Court of Tours has awarded a carter named Cordien the sum of 200 francs for injuries sustained by him in a collision with a Bollée voiturette belonging to M. de Louvencourt, who was in addition fined 100 francs.

### Paris-Boulogne Race.

THE conditions of this race, which is set down for decision on the 17th inst., have been considerably modified. The programme as now arranged is as follows: The start will be given at Saint Germain and the route will be by way of Pontoise, Méru, Beauvais, Grandvilliers, Poix, Abbeville, Montreuil-sur-Mer and Samer, a total distance of 230 kilometres. The value of the prizes is 4,000 fr., and the categories are: (1) Carriages and voiturettes of 6 h.p. and upwards; (2) carriages and voiturettes of less than 6 h.p.; (3) motor-cycles of two places, *both occupied*. This latter class is an entirely new feature in an automobile race and should be of particular interest to manufacturers of speed change gear for motor-cycles.

### Automobiles at the French Army Manœuvres.

EACH day during the progress of certain army manœuvres in the neighbourhood of Bordeaux General Varaigne, commanding the 18th Army Corps, traversed the fifteen kilometres between that town and the scene of action in an automobile piloted by Lieutenant Lannelue-Sanson. Brigadier Winther, driving his own car, also assisted at the manœuvres and the military authorities were most favourably impressed with the speed and convenience of both vehicles.

### The Stanley Steam Car in Paris.

WE understand that the American Automobile and Motor Company, Limited, of Paris, has just concluded an important contract with the Locomobile Company of America, whereby they acquire all the patent rights in connection with the "Stanley" car. The latter Company is said to have a large number of cars in course of construction in America, and it is hoped that several will be sent over for exhibition in Paris by the end of the month. The Paris Company's address is 47 Boulevard Hausmann, but additional premises are being obtained for show-room purposes.

### The Exhibition at Berlin.

LAST Saturday the International Exhibition of Automobiles at Berlin was formally opened by Herr Podbielski, in the presence of a great number of high officials. Four thousand guests attended the opening ceremony, which passed off most successfully. The installation of the show was far from being finished, as many firms had not been able to complete their list of exhibits; but this is a defect common to most exhibitions, and has since been remedied at Berlin.

### Nice-Puget-Théniers Race.

other for motor-cycles.

### Public Motor-Car Services in Spain.

UNDER the patronage of the Automobile Club of Nice, this race has been organized for the 10th instant. The distance is only 65 kilometres, and there are but two categories, one being for carriages and voiturettes and the

### Motor-Car Races in Germany.

WE learn from a Spanish correspondent that a company has just been formed in Coruña to establish and work public motor-car services between Caldis and Calin, *via* Estrada and Cuntis.

IN addition to the two races mentioned in our last issue the authorities of the Berlin motor-car exhibition are organizing a long-distance race from Berlin to Munich, a distance of about 630 miles. The race will be divided into three categories: (1) Cars seating at least three passengers; (2) cars seating at least two persons; and (3) small single-seated cars and motor-cycles. The start is fixed for the 28th inst.

### Electric Omnibuses in Berlin.

ON Sunday last public electric omnibuses began to run in the streets of Berlin, the fare for about one mile being 20 pfennige (about 2d.). The speed is nowhere to exceed eight miles per hour. The car will run for the present in connection with the motor-car exhibition, which opened on Sunday; but should they prove a success the police authorities are prepared to permit their general use.

### The Projected Paris-St. Petersburg Race.

MESSRS. THEVIN AND HOURS, the two members of the Automobile Club de France who have been delegated by that Club to inspect the route of the proposed Paris-St. Petersburg race of 1900, have reached Königsberg, Prussia. They describe the road into Berlin as being fearful for the sixty miles nearest Berlin, but they are delighted with the Prussian roads generally.

### German-Daimler Racing Cars.

WE learn that the Daimler Motoren Gesellschaft, of Cannstatt, Wurtemberg, has just taken up the construction of motor-cars specially adapted for racing purposes. The new German-Daimlers are to be fitted with motors of 24 h.p., and will be, it is expected, ready in plenty of time for next year's racing season on the Continent.

Of late all sorts of impossible names have been suggested for a self-propelled vehicle in lieu of the words "motor-car" or "automobile." A recent writer to an American daily paper urges, apparently without any special reason, that the name "tomole" be adopted.

IT is announced that the United States Automobile Co. is working on a new type of electric motor-vehicle. Preliminary tests are said to have been very satisfactory. One of the features lies in the motor, which is so designed that there is no occasion for employing the usual differential gear, or "jack-in-the-box," as this device is sometimes called. It is said that the motor weighs less than one-half the weight of an ordinary electric motor commonly used for automobile vehicles. A 2½-h.p. motor of this new construction weighs 77 lb., and one of 5 h.p. weighs less than 125 lb. The steering handle is so constructed that it is always held firmly in whatever position the operator may put it, and the steering wheels cannot change the position in which they are set by the steering lever, no matter what strain is put upon it.

## The De Dion Motor-Voiturette.

A FEATURE of the recent motor-car exhibition in Paris was the large number of light motor-cars to seat two or three persons, and chief among the exhibits of this class of vehicle was the new two or three seated voiturette of Messrs. De Dion & Bouton, of Puteaux (Seine), of which we are able to give an illustration herewith. As will be seen, the car has a very attractive appearance. The motor is of the well-known De Dion vertical type, but of a larger size than usual, it being capable of working up to 3 h.p.; the ignition is electrical, while a new departure is the provision of a water-jacket. A small pump is employed to maintain the circulation, the heated water being passed through a condensing coil in front ere it returns to the storage tank. The carburettor employed is of a new form, and is of the spraying (pulverising) type. Two speeds are provided—12 and 30 kilometres per hour—controlled by a hand wheel on the steering column. Any intermediary speed can be obtained by regulating the sparking device in the usual way. The motor is situated at the rear of the car, and drives the rear road axle through centrally-located gear wheels, a friction clutch, controlled by a foot pedal, being provided, by means of which the motor can be instantly cut out from the transmission gear. For the rear axle Messrs. De Dion & Bouton have adopted the Cardan method of construction as used in their heavy steam cars, the axle being built up in several pieces connected by four universal joints, all vibration due to uneven roads being in this way, it is claimed, overcome. The frame of the car is constructed of steel tubing, while the road wheels are of the suspension type, of equal size, and fitted with pneumatic tires. The motor is arranged to be started by means of a detachable handle; two band brakes, controlled by foot pedals, are also provided, one acting on the intermediate shaft and one on the differential drum. The variable speed gear is enclosed, and works in an oil bath. The car, which weighs about 600 lb., is mounted on springs fore and aft, and is described as being a most comfortable vehicle. Another feature to which attention is drawn is that very few parts of the motor and transmission gear are visible, and that all the control gear, except of course the pedals controlling the friction clutch and band brakes, is mounted on the steering column. The makers claim that even at the high speed the car will mount gradients of from 5 to 6 per cent., and that on the low gear any hill can be negotiated. The new car is being introduced into this country by the United Motor Industries, of 3 Rue Meyerbeer, Paris.

It is reported that the Austrian Small Arms Works at Steyr, Bohemia, intends to add to its existing cycle factory workshops for the construction of motor-cars.

A LIVERPOOL daily states that the Parks Committee has provided a motor mowing machine at Newsham Park, and for over a fortnight this machine has been in use.

A PATENT has been taken out by Mr. H. C. Stephen, of Torbay, Western Australia, for an auto-motor "jinker," intended principally for conveying heavy logs.

BROOKLYN, N.Y., is to have an Automobile Club. The objects of the organization will not, it is reported, be social, but devoted rather to the study and improvement of motor-vehicles.

MR. VAN TOLL, late of the Daimler Motor Co., is now a partner in the Orleans Motor and Cycle Co., Twickenham, who are repairers of all kinds of motor-vehicles. Probably early in next year a new type of car will be introduced called "The Orleans," which will be fitted with a two-cylinder motor and driven by belts.

MESSRS. F. SAVAGE & Co., Ltd., of King's Lynn, one of the firms which have undertaken the construction of Pennington motors, are establishing a large new shop for the work, in which special plant is to be laid down. Only the motors themselves are to be manufactured at Lynn, the cars being constructed and completed elsewhere.

THE National Association of Gas and Gasolene Engine Manufacturers has just been formed at Columbus, O., U.S.A., for the purpose of bringing together at stated intervals manufacturers of gas and gasolene engines, to discuss such matters as are of interest to them. The Association will hold its first meeting in Chicago the first Wednesday in November.

AT the last meeting of the Westmoreland County Council, Mr. C. J. Cooper drew attention to the excessive speed at which motor-cars were run in some cases. He doubted whether it was known that they must not legally run at a rate exceeding fourteen miles an hour, and questioned whether even the police were aware of this. On his motion, seconded by Mr. Puckle, it was resolved that the joint committee give instructions to the police as to fourteen miles an hour being the outside limit, and that they have instructions to act thereon.

## SCOTTISH NOTES.

**Exit the  
Dust Fiend.**

THE rain which has fallen here lately has been welcomed by all classes of motor-carists. The long drought which practically lasted throughout the whole of August was responsible for very dusty roads. In fact, in some parts of the country it lay inches thick, with the result that when driving over roads where this state of affairs prevailed a perfect whirlwind of blinding dust was thrown up, and on reaching the end of one's journey a resort to soap and water, not to speak of a good brush down, was always the first thing to be thought of. A friend of mine who drives out a good deal himself has had an overcoat made for no other purpose than to try and hide the dust. It is of a light grey colour, made long to keep the legs warm, and the jacket pockets can be reached without unbuttoning the overcoat. After travelling several miles on dusty roads one's appearance is apt to get very disreputable unless due precautions are taken, and I think a garment of this sort has much to recommend it.

**Liveries for  
Motor-Car  
Drivers.**

TALKING of clothes reminds me that a doctor writes asking information about a livery for his driver. Of course, top boots, knee breeches, and silk hat, as he points out, are quite out of the question. A friend of mine who was exercised about this same question himself when he first procured his motor-car has adopted a uniform for his driver which I think looks very well. The coat is of very dark green cloth, high in the neck like a military tunic, and with brass buttons. The flap pockets are buttoned down, and the material is edged with a very narrow yellow line. The trousers are ordinary livery ones, very dark green but relieved like the coat with a narrow yellow stripe. The hat worn is a species of forage cap, dark green with yellow line round rim, and enamelled leather skip. The result is, in my opinion, very good, the livery looking decidedly smart, and matching the colour of the car, which has dark green for its foundation.

**The Care of  
Motor-Cars.**

THERE would certainly be some excuse for the prejudice entertained by some people against motor-cars if many such as I saw recently at a certain Clyde watering-place are to the fore. The car itself, as far as construction went, was all right, but can any one believe that it went "plugging" along with one tire off on the front wheel and one on, while the back wheels were the proud possessors of one steel tire and a well worn rubber one? The car was grey with dirt and dust, and had apparently not seen water for some considerable time. It made as much "racket" as a hay-cutting machine as it moved along the road to a noisy accompaniment of loose bolts, rattling chains (striking gear case), etc., etc., and one could not wonder at the derisive epithets hurled at the "chauffeur's" head by envious (?) Jehus. Private owners of motor-cars need no advice to keep their carriages in perfect condition, but in a few instances the advice is undoubtedly needed in the case of some owners of cars plying for public hire.

**The Motor-Car  
and Nobility.**

As anticipated the other week, the Duke of Hamilton, who arrived at Hamilton Palace at the end of last month, has once more shown his partiality for the horseless carriage. Every day during the past week two or three automobiles have been in requisition to convey his Grace's shooting party to the Moors, which are situate a little beyond Strathaven, some ten miles away. Naturally the fact that the premier Duke of Scotland should prefer the new method of locomotion to the old has given rise to a good deal

of talk, and that is what the movement usually benefits by. Safety bicycles, especially for ladies, were well "tabooed" for a long time by many people until members of the Royal Family and titled aristocrats took them up, and then what a rush was made by the "Misses Brown, Jones and Robinsons" to follow suit! Verily, there is a good deal of the snob in human nature! So will it be with the motor-car. So soon as automobilism becomes a fashionable craze, as it promises now to become, the crowd will imitate the example set by society leaders and quickly become the proud possessors of motor-cars. What struck me more forcibly than anything, however, this week was to see a certain popular master of foxhounds riding in a motor-car on the Carlisle Road, and at a smart rate, too. The gentleman in question does not own a car, and the one he occupied was hired; but who knows what the result of his experience may be? A great many sporting men would scorn to look at a horseless carriage, far less ride in one; and it says something for the common-sense of this gentleman that he does not believe in condemning a thing untried, as is almost invariably done by many, who decry motors without knowing anything about them.

**With Law  
and Order Aboard.**

I WAS more than pleased on Monday to see Captain Despard, the Chief Constable of Lanarkshire, and Captain Monro, H.M. Inspector of Constabulary for Scotland, bowling merrily along on a motor-dog-cart, the latter gentleman inspecting the various police-stations *en route*. I will not guess at what speed they were travelling when the car flashed by me on a quiet country road between East Kilbride and Stonehouse, but I had to creep behind a hedge to conceal the grin which overspread my countenance as I thought of what this meant. To have the leading police officials in the county scor—I mean riding about in a motor-car was productive of many thoughts, not the least pleasant of which was that, knowing what a car could do and could not do, it would be only reasonable to suppose that the interests of Scottish autocarists would not suffer in consequence.

"BROWN HEATHER."

MR. JAS. SHEPHERD, of Somerset Place, Boscombe, Bournemouth, who is taking an active part in the motor movement in the South of England, has, we learn, decided to establish an electrical plant in connection with his works, for the charging of the accumulators of electrical-vehicles, etc.

MR. WINTON, of the Winton Motor-Carriage Company, Cleveland, has recently completed what is probably the first motor-carriage designed wholly for racing purposes ever built in America. Placed beside the ordinary pattern Winton carriage, the racer is described as being a perfect monster, being heavier and larger in every way.

MR. PERCIVALE BOUCH, who resides in Dorsetshire, was recently driving from Lyndhurst to Southampton. A motor-car came along; his naughty horse reared, and pitched Mr. Bouch out of his buggy. Mr. Bouch has sent an account of the accident to the Local Government Board, and written to a contemporary to say: "It is most certainly time that something should be done either to see the present law rigorously enforced or some more stringent rules placed upon motor-cars."

AN important organization in the western section of the United States is the Mississippi Valley Automobile Transportation Co., of St. Louis, with a capital of £100,000, which will operate electric and other vehicles, principally in St. Louis. They have made arrangements with the Woods Motor-Vehicle Co., of Chicago, for a supply of their cabs and carriages, the latter to be leased to private parties and the former to be introduced for public hire. Delivery wagons will also be leased to local merchants under the care of the Company's experts.

## THE MALÉZIEUX COMPRESSION REGULATOR FOR PETROLEUM-SPIRIT MOTORS.

THE accompanying illustration gives a section of an arrangement which has lately been devised by M. F. Malézieux, a French engineer, for regulating the compression of the explosive mixture in petroleum-spirit motors between the maximum and minimum degrees permitted by the motor. Referring to the illustration, *A* is the regulating piston, which is controlled by the hand wheel and screw *B*, *C* is the piston of the motor, *D* the explosion chamber, *E* the admission valve, and *F* the exhaust valve. As regards the method of operation of the regulator, if *a b* represents the position of the piston *A* for maximum and *c d* for minimum compression, it will readily be seen that any desired

degree of compression between the two may be obtained by means of the regulator, the compression of the carburetted gas varying inversely with the space in which it is contained. Thus by increasing the capacity of the explosion chamber by means of the movable piston the effect of the explosion is reduced and the motor slowed down. In a petroleum motor-carriage the regulator can be arranged to be controlled from the driver's seat, so that not only can he increase or diminish the power of the motor, while running, according to the character of the route being traversed, but when it is necessary to stop the position of the compression piston can be readily so regulated as to reduce the speed of the motor to the minimum.

MESSRS. OWEN, BRAZIL & HOLBORROW, of the Vulcan Iron Works, Bristol, inform us that in consequence of the great increase in their business and of their having entered into partnership relations with Mr. Sidney Straker, A.M.I.C.E., of London, they have found it necessary to convert their firm into a limited company. The style of the new company will be Brazil, Holborrow & Straker, Ltd. The conversion will not affect the conduct of the business.

## MORE PROSECUTIONS IN SCOTLAND.

IN Edinburgh Police-Court on the 30th ult., before Acting Sheriff-Substitute Sym, William Henry Ewing, driver in the employment of the Edinburgh Autocar Company, Limited, was charged with having, in Regent Road on the 8th ult., driven the car under his control recklessly, furiously and carelessly. The accused, who was defended by Mr. Isaac Connell, tendered a plea of not guilty. From the evidence it appeared that on the day in question Ewing and another driver who was in charge of a second motor were proceeding with their cars to Portobello. According to the witnesses for the prosecution, both cars were travelling at a speed varying, according to the individual computations, from fifteen to seventeen miles an hour when the one driven by Ewing was stopped by the constable at Abbeymount. Two tram-car inspectors were among the witnesses for the prosecution. For the defence, Leishman, the second driver, an engineer named Wallace, and the accused himself, stated that it was impossible, owing to the setting of the speeds, for the motor to be travelling at the rate mentioned. Further, a tram-car which left Waterloo Place shortly before the motor-cars remained in front all the way. They estimated the speed at which the motors were travelling as under seven miles an hour. A gentleman who had timed the tram-cars on the incline, and afterwards taken the measurements, said that their speed was nine miles an hour at this point. The Sheriff found the charge proved, and fined accused £1, with the alternative of fourteen days imprisonment. A similar charge against Leishman, the second driver, was deserted *pro loco et tempore*.

## MOTOR-CAR ACCIDENT.

ON Wednesday evening, the 30th ult., a party of three gentlemen named Messrs. W. Truscott and J. R. Hopkins, of Stonehouse, and Herbert, of Bristol, were journeying by motor-car from Gloucester to Stroud, when at the cross roads leading towards Haresfield the car collided with a conveyance which was driven at right angles across the road. The car ran against the horse and was considerably damaged. Mr. Herbert, who was sitting in front, sustained the full force of the impact, and unfortunately broke a rib. The horse was also injured, but the other two occupants of the car escaped unhurt. The sufferer was medically attended at Stonehouse, and then removed to Stroud.

## MOTOR-CAR ACCIDENT AT PORTSMOUTH.

DURING the trial at Portsmouth of a new motor-car to be used on the light railway about to be constructed between Cosham and Horndean, an accident occurred on the 1st inst. The motor-car, with two bogie cars behind it full of passengers, had made a satisfactory run to Cosham, and was returning to Portsmouth, when, in going on to the siding at North End, it suddenly left the rails and crashed into the garden wall of Mr. A. W. White, the promoter of the light railway, knocking down eight or ten yards of the brickwork. Mr. Neave, a captain in the merchant service, was thrown under the car, which was brought up by a tree. On being got out, Mr. Neave was found to be only bruised and suffering from shock. The bogie cars in the rear were thrown off the lines, and some of the passengers fell on to the road, but escaped injury. The front of the motor-car sustained some slight damage.

## FURIOUS MOTOR-CYCLING.

AT the Stonehouse Petty Sessions on Thursday, the 31st ult., Ernest Henry Wright, tobacconist, of Cheltenham, was summoned for furiously driving a motor-cycle at Cainscross on August 5th. Mr. Langley Smith, who appeared for the defendant, said that his client wished to plead guilty. He was undoubtedly going at more than twelve miles an hour, but owing to a mishap the machine to a certain extent had become unmanageable. He expressed regret. Police-Constable Garner stated that defendant appeared to be going like a train. Defendant, who remarked that he had driven motor-cars for four years and had not before been spoken to regarding the speed at which he travelled, was fined £1, and 7s. 4d. costs.

THE Rev. A. S. Parsons, Berkeley, California, is having a motor gospel-wagon built by a San Francisco firm, with which he will tour the State.

MESSRS. MAJOR & GILKES, of 20 Broad Street, Reading, is another of the many cycle firms of the country which are keeping well to the front in the automobile movement. They have secured the sole agency for Beeston motor-tricycles for Reading, Wokingham, Henley, and Wallingford. They have ample storage accommodation for motor-cars, and can undertake prompt repairs to the same. Needless to add, they are carrying a stock of petrol and other motor-car accessories.

## SALES, WANTS, Etc.

[All Advertisements under this heading will be inserted at the minimum rate of 1s. 6d. for 18 words and thereafter at the rate of 1d. per word per insertion, but on no account will any Advertisement be inserted unless prepaid.]

TRICYCLE FOR SALE at a low figure. Practically new and latest pattern; genuine De Dion throughout; with all accessories; can be seen in London.—Box 72, *Motor-Car Journal*, 39-40 Shoe Lane, London, E.C.

TWO MOTOR DELIVERY VANS, in good condition; can be altered into wagonettes; one £70 and one £100.—Apply Frank F. Wellington, 36 St. George's Square, Regent's Park, N.W.

MOTOR-QUADRICYCLE, interchangeable to tricycle, by De Dion and Bouton, very little used, exceptional bargain, in grand running order; price £67 10s.—Apply Frank F. Wellington, 36 St. George's Square, Regent's Park, N.W.

DE DION TRICYCLE, 1½ h.p., electric ignition, in first class order, £35. Also 1-h.p. De Dion Tricycle, in splendid running order, £30; and Two Werner Bicycles, in running order, £20 each.—Apply Frank F. Wellington, 36 St. George's Square, Regent's Park, N.W.

COVENTRY MOTETTE FOR SALE, in first class running order, fitted with new back tires; £55.—Apply Frank F. Wellington, 36 St. George's Square, Regent's Park, N.W.

DAIMLER MOTOR-WAGONETTE, 5½ h.p., grand carriage, in perfect condition, new tires, repainted and upholstered, to carry four or six, free trial to buyers; price £265.—Apply Frank F. Wellington, 36 St. George's Square, Regent's Park, N.W.

DAIMLER MOTOR-WAGONETTE, 5½ h.p., to carry eight passengers besides driver; geared low for hill climbing, suitable for passenger service, in perfect running order, hardly been used; price £265.—Apply Frank F. Wellington, 36 St. George's Square, Regent's Park, N.W.

BENZ INTERNATIONAL, to carry three; beautifully upholstered, very powerful, all latest improvements, in grand order; price £120.—Apply Frank F. Wellington, 36 St. George's Square, Regent's Park, N.W.

WELLINGTON'S "MOTOR-CAR REGISTER AND ADVERTISER" posted free to any address; send post card for copy to Frank F. Wellington, Proprietor, 36 St. George's Square, Regent's Park, N.W.

NEW GENUINE MOTOR-TRICYCLE by De Dion & Bouton; latest 1½ h.p., guaranteed perfect order; can be seen any day.—Paris Singer, 165 Manor Street, Clapham, S.W.

COVENTRY MOTETTE for Sale, in splendid working order. New 3½ cylinder. What offers?—Grose, Limited, Northampton.

MOTOR-CAR DRIVERS WANTED.—Must be experienced and of good character. Write stating wages expected to Box 24, *Motor-Car Journal* Office, 39-40, Shoe Lane, London, E.C.

SITUATION VACANT.—Thoroughly good Mechanic required to superintend a number of Panhard and Daimler cars. Only experienced men need apply. Good salary to really expert man.—Apply, Box No. 41, *Motor-Car Journal*, 39-40 Shoe Lane, London, E.C.

DE DION TRICYCLE (second hand), 1½ h.p., for Sale. Very fast machine; lowest price £38.—May, 417 Brighton Road, Croydon.

DE DION MOTOR-TRICYCLE, 1 h.p., splendid goer; in perfect order; price £28.—Motor Works, Brighton Road, Croydon.

BENZ FOUR-WHEEL DOG CART, 5 h.p., latest type, for Sale. Written guarantee. Thoroughly reliable; good reason for selling; price £210, or offer.—A. Dowson, Widcombe House, Brislington, Bristol.

TWENTY PER CENT. INTEREST OFFERED.—Wanted to Borrow £40, on the security of 110 fully-paid £1 British Motor and Motor Manufacturing Companies' Shares.—Address, Box 50, *Motor-Car Journal*, 39-40, Shoe Lane, London, E.C.

FOR SALE.—Excellent four-seated Benz Car, 5½ h.p. motor; price £150; can be tried.—Apply, Box 67, *Motor-Car Journal*, 39-40, Shoe Lane, London, E.C.

BACK NUMBERS "MOTOR-CAR JOURNAL."—Numbers 1 and 4 are out of print. Of other back numbers we have but a few left. Those desirous of completing their files should make immediate application for missing copies. Usual price, 1d.; post free 1½d, or through any news-agent.—Cordingley & Co., Proprietors, 39-40 Shoe Lane, E.C.

## Trade Announcements.

[All Advertisements under this heading will be inserted at the minimum rate of 2s. 6d. for 30 words and thereafter at the rate of 1d. per word per insertion, but on no account will any Advertisement be inserted unless prepaid.]

PLATINUM.—Used Ignition Tubes Wanted, and Platinum Scrap of all kinds Purchased; best prices by Derby & Co., 44 Clerkenwell Road, London, E.C. Established 1797. 24

MOTORS ON HIRE.—Daimlers, Panhards, Benz, New Beestons, etc., in good order, by day, week, or month.—The Yorkshire Motor-Car Co., Ltd., Bradford.

NORTH OF ENGLAND AGENTS for Phébus-Aster Motors, best Motor Accessories, Horns, Toolbags, Ignition Plugs, Valves, Piston Rings, etc. Repairs thoroughly done.—J. A. Bennett & Co., 3 Exchange Arcade, St. Mary's Gate, Manchester.

BENZ.—Millimetre Pitch Chain Wheels, Pinions, and Chains. Several sets for Sale, second hand; low price.—Apply Motor Works, 417 Brighton Road, Croydon.

"THE MOTOR-CAR MANUAL," by R. Moffat Ford, deals with every type of oil motor in a plain and simple manner, for lay readers. How to buy a motor-car, and how to treat it when bought. Why is a motor when it stops? How to make an excursion, and so forth. Treats fully of Daimler, De Dion, Benz, Bollée, Panhard, Mors, Peugeot, and other motors. Post free in exchange for Postal Order value 2s. 6d.—The Motor-Car Co., 168 Shaftesbury Avenue, London, W.C. 26-39

## TO CORRESPONDENTS.

All communications intended for insertion in this Journal or relating to Editorial matters should be addressed to THE EDITORIAL DEPARTMENT, MOTOR-CAR JOURNAL, 39 and 40 Shoe Lane, London, E.C. Letters must in all cases be accompanied by the name and address of the writer, as no notice will be taken of anonymous communications.

The Editors cannot undertake to return MSS. or drawings, although every effort will be made to do so in the case of rejected communications. Where such are regarded as of value, correspondents are requested to retain copies.

The Editors do not hold themselves responsible for the opinions expressed by their correspondents, or for statements and facts which do not appear in the editorial columns.

The Editors and Publishers beg also to state that they will accept no responsibility for unsolicited contributions, even if used, unless payment for same is directly specified in forwarding, and the terms arranged before publication.

To insure insertion communications and contributions must be in the Editors' hands by Wednesday forenoon of the week in which the same are intended to appear. Disappointment may be caused by non-compliance with this rule, and to avoid this earlier receipt, if possible, is necessary.

# THE Motor-Car Journal.

Vol. I.]

LONDON, FRIDAY, SEPTEMBER 15th, 1899.

[No. 28.]

Published Weekly by CORDINGLEY & CO., 39 & 40 Shoe Lane, London, E.C.

## COMMENTS.

DURING the last few weeks the daily and weekly papers have given publicity to the statement that "in consequence of the number of serious accidents which have occurred through the excessive speed of motor-cars in the suburbs, the Chief Commissioner of Police has sanctioned the employment of a number of mounted men for special

duty on the main western roads which are most frequented by motor-car drivers." To those acquainted with the actual state of affairs the paragraph appeared silly and absurd, but so persistent was the publicity given that we placed ourselves in communication with the Chief Commissioner of Police on the subject, and have received the following reply:—

NEW SCOTLAND YARD, S.W.

September 13th, 1899.

SIR,

With reference to your letter of the 6th inst., I am directed by the Commissioner of Police of the Metropolis to acquaint you that, so far as the Metropolitan Police District is concerned, there is no foundation for the report as to special men having been posted on the main western roads, etc.

I am, Sir,

Your obedient servant,

D. H. NORTH,

For Acting Chief Clerk.

THE EDITOR,

THE MOTOR-CAR JOURNAL.

All automobilists thought as much; the fact is that the proportion of accidents caused by motor-cars is, proportionately to the number in use, far below the number of those caused by horse-drawn vehicles.

Accident to  
Mr. J. A. Bradshaw.

His many friends will regret to hear of the serious accident that recently befel Mr. J. Arnold Bradshaw, a well-known Liverpool automobilist, who lately resigned his directorship of the Daimler Motor Co. He had a shooting

party at Llangollen, North Wales, where he has a country house, and was kicked while in the saddle by his daughter's horse, which suddenly lashed out. Dr. J. McMurray, ex-Mayor of Bootle and Mr. Bradshaw's own medical attendant, who was one of the party, did all that was possible with improvised splints and bandages and some carbolic acid dressing which he fortunately had with him. Mr. Bradshaw insisted on going home, and was carried to Llangollen Station on a gate, whence the journey to Liverpool was performed by train. Only this week the doctors announced that the fear of amputation being necessary was passed. Mr. Bradshaw lies at his residence, The Downs, Blundellsend, near Liverpool. We are voicing the feeling of all our readers in hoping for his rapid recovery from a very serious accident,

Hope for  
the Farmers.

AGRICULTURISTS have long been compelled to submit to the exorbitant rates imposed by railway companies on their produce. Agitation has succeeded agitation, but the rates have continued their unfair pressure upon British agri-

culture. At length the advent of the motor-vehicle offers a competitor which may not yet have the effect of reducing the rates, but which will provide an alternative that may serve the farmer. Mr. W. H. Lever, the chairman of the Wirral and Birkenhead Agricultural Society, has been cheering the members of that organization by telling them of the possibilities of the motor-car not only in conveying produce from localities now served by the railway, but also in tapping new districts as yet inaccessible to the railway. In our issue of July 28th we referred to the enterprise of Mr. W. F. Lockeking, of Weybridge, in ordering three vans for the transport of farm and dairy produce from that place to London, and if agriculturists would seriously consider the suitability of horseless vehicles they would quickly realise their usefulness.

The Motor-Car  
on the  
Plantations.

In this connection some innovations are being made on the cotton fields of the Southern States of America, where several large owners have been investigating the possibility of successfully introducing the steam wagon for

the transportation of the cotton crop from the fields to the market. Apparently they have hailed it with satisfaction so far as the outlying districts are concerned, for one of the leading firms is reported to have ordered six motor-wagons, to be employed in moving the cotton crop between Augusta, G.A., and Charleston, S.C. From Cuba comes another interesting report with regard to the war having caused such a scarcity of oxen that the sugar planters would willingly adopt motor-vehicles if they were procurable. So, at least, states an American paper.

Ladies  
and  
Motoring.

MRS. BAZALGETTE, with a lady friend, has just concluded a pleasant trip on her Benz motor-car through Essex. They were accompanied by a lad to clean and look after the car; but the outing fully demonstrated the

capacity of ladies to go a-motoring and thoroughly enjoy it. Leaving her house in Portman Square one day half an hour after noon Mrs. Bazalgette reached Chelmsford at 6.30 p.m. via Hatfield, through mile after mile of lovely lane, and crossing two small rivers ere they reached Bishop Stortford on the way to their destination. The only hindrances were the great harvest wagons that occupied most of the narrow lanes and necessitated stoppages here and there. Among the other trips recently enjoyed by this expert lady-motorist have been runs to Henley, to Brighton, and to Oxford. Most probably she will motor to Dover next week. These trips cannot fail to do much to popularise automobilism among the fair sex, who are being rapidly won to the seat of the motor-car.

### Away with Bluff.

"OPEN confession is good for the soul" and creditable to the conscience of those who make known their delinquencies. Therefore we heartily congratulate the American *Horseless Age* upon the following declaration:—

"Nowhere else in the world have so many 'fake' inventions and promotion schemes in the motor line been brought out as right here in the United States, and to-day the whole country and the honest workers in the field are suffering from the effects of the exaggeration, bluff, and, in some cases, dishonesty which have too often been associated with American motor-vehicle promotion in the past." But a better day is dawning, and, "happily," continues our contemporary, "the speculators, bluffers, and cranks who brought us into bad odour have been displaced by engineers and manufacturers who will show tangible results and convince our foreign friends that the American motor-vehicle industry is not all bluff by any means." After such a confession we must patiently, and in silence, wait the advent of something that is not "bluff by any means." That it may be a long time might be inferred from a statement by Mr. G. H. Brown, the secretary of the Winton Motor-Carriage Company, of Cleveland, who recently said it would be "some years before we can make good machines fast enough to supply the domestic demand, or export motor-carriages."

### British Carriage Builders and Automobilmism.

In the ancient City of York, the twelfth annual autumnal meeting of the Institute of British Carriage Manufacturers was opened on Tuesday, under the presidency of Mr. S. G. Turner, of Bristol. In his presidential address

that gentleman urged the adoption of a far-seeing policy by British carriage builders, who had been too prone to be content with things as they were, without any apparent

MR. A. O. STOPE'S MOTOR-CAR IN THE LIFE-BOAT SATURDAY PROCESSION AT COLCHESTER.

desire for progressive work in the interests of the industry. Mr. Turner acknowledged that there had lately been a great improvement in the designs of carriages, but confessed he was unable to note any improvement in their manufacture. With reference to the motor-car industry, there was undoubtedly a great future for such vehicles, both in the matter of passenger and goods traffic. But this could only be achieved through the combined efforts of the coach builder and the engineer. We are glad to see the president of the British Carriage Builders assume a position we have always regarded as indispensable to the welfare of carriage builders, who cannot afford to be indifferent to automobilism, since future developments will necessitate their close study of motor-vehicles if they do not want to be left behind competitors.

### Mo(o)re Motor-Cars.

ALREADY Old Moore's almanacks are being issued, and the predictions for 1900 are being studied in rural districts. According to one of these publications "scorchers" will appear on the highway in April, and "we hope that the

police will be provided with swift and reliable motors, capable of overtaking these reckless dust-raisers." Another Old Moore's almanack—there are several varieties of the calendar—predicts that in June next "motor-cars will increase in thousands, and many fatalities occur through them." To those acquainted with the motor-car industry this will hardly appear of the nature of prophecy.

### Motor-Cars for Hire.

IN our issue of June 16th last we referred to the motor-car hiring business which is being carried on by the British Motor-Coupé Co., and illustrated two of the types of vehicles employed for the purpose. The other

day we called at the Company's depot in the Euston Road, N.W., and were glad to find that the cars are being taken advantage of to an encouraging extent, the users in every instance being more than pleased with their experience of motor-vehicles. The Company has now quite a large fleet of cars available, including victorias, broughams, family omnibuses, and chars-a-bancs, and can undertake to carry parties up to fifty in number. At the time of our call one car was being washed ready to carry a party of four up as far north as Leeds, while another car was being prepared for a journey to Devonshire and back. We were quite surprised at the extent of the Company's premises in Euston Road. Some important alterations are shortly to be taken in hand with the view of converting the front portion into a spacious depot where a large number of motor-vehicles will be kept both for sale and hire. The locale is unusually well situated for the purpose, as, being close to Regent's Park, any intending purchaser or hirer can promptly be given a trial trip, the result of which, with the comfortable and reliable vehicles available, cannot but be satisfactory.

### Glasses for the Police.

THE police are indulging in glasses—no offence meant, as the glasses are for the eye and not for other purposes. This enterprise has been inaugurated at Yarmouth, where the Chief Constable, a sergeant, and two minor constables from various points of vantage on the piers and beach observed the alleged furious driving of Mr. Bertie Miller. With a pair of glasses Police-Constable Fisher watched the progress of the vehicle while a colleague took the time of the car which, they said, gave a speed of thirteen miles an hour. Against a quartette of policemen Mr. Miller declined to call witnesses, contenting himself with a denial of his furious driving and paying the fine of 40s. Are we to anticipate the addition of field glasses to the policeman's accoutrements?

### Motor-Bicycles.

THE application of the motor to the bicycle has been often tried, but so far with no great success. The opinion appears to be very generally held that a vehicle that cannot stand alone is not adapted to self-propulsion. Notwithstanding this, however, it is noteworthy that quite a number of new motor-bicycles have lately made their appearance in France, but whether they will prove more successful than their predecessors remains, of course, to be proved. Messrs. De Dion & Bouton, the well-known motor-tricycle builders, only make motor-bicycles to order, and only recommend the machine to be ridden in fine weather, as they consider it is dangerous to ride on wet or slippery surfaces.

**A  
Perfect  
Fiend.**

WE once heard Sir Wilfrid Lawson declare that there was only one perfect thing in this world—a perfect fool. Mr. W. E. Geddes, who resides at Cambridge House, Coventry Park, Streatham, S.W., has discovered

another, and, writing to a contemporary, says “the average driver of a motor-car seems to be a perfect fiend.” The motor-car itself he defines as a “big, ugly, evil-smelling

THE PARIS-OSTEND RACE.—M. LEMAITRE'S CAR, WITH GIRARDOT'S AT REAR.

thing.” Having heard the opinion of Mr. Geddes with regard to the “average driver of a motor-car,” it would be interesting to hear the latter's opinion of Mr. Geddes, who drives “a pair of fine, high-mettled horses” in tandem fashion.

**Who Killed the  
Turkeys?**

THERE is some feeling evidenced in the Norfolk papers against motor-cars because the other day “some one a few miles from Norwich drove one of these motor-cars at a furious rate through a flock of turkeys being driven across the road, killing some and injuring others.” Without waiting to count the killed and wounded, the driver hurried along and passed from sight. The effect of motor-cars on various forms of life will form an interesting subject for the philosopher in the future, and we shall be glad to receive the experiences of our readers on the subject, so that ample evidence can be obtained upon which to base accurate conclusions.

**The Motorist  
of the  
Future.**

THE *Irish Cyclist* does well to remind intending owners of motor-tricycles, etc., that some knowledge of mechanics and a few hints for friends will be of material service to them in managing their machines. Much discredit can attach to any new development by the want of knowledge on the part of those who associate with it; hence the need for guidance in such matters before experience comes. Having pointed out that years of acquaintance with equine quadrupeds are required to make a man “horsey,” the Editor of our contemporary seems to have gone to his dictionary before describing the motorist of the future as “fitted with a stoker's face, presbyoptic vision, abnormal acrobatic flexibility of the spine (for diving under the car), cyclometric aberration of the speed-reckoning nerves (a branch of the mendacity department), oily, liquid eyes (s. g. 0.70), great tractive powers, with the proper muscles correspondingly well developed (useful for hauling home derelict cars), deranged smelling powers (bouquet de benzoline a favourite perfume), peculiar garrulity of speech, with a predilection to monosyllables; the motor-car voice (something akin to that of a steam syren

smothered in naphtha). The dress will be reminiscent of a polar bear brought up in an oil tank. Other interesting little traits will make their appearance in time, but we have given enough to enable any lay person to identify the motor-man.” We quote this without prejudice.

**Another New  
Car.**

WHEN calling on Messrs. F. Jackson & Co., Ltd., of Oxford Street, London, W., the other day we were shown the drawings of a new four-seated motor-car the Company has at present in course of construction. The motor and transmission gear will be carried on a steel tubular frame to which any type of body can be attached. There will be two motors giving together about 5 h.p. and located in the front portion of the car; they are of the vertical type, working on to the same crank-shaft. Two forward speeds and one reverse motion are to be provided, the transmission to the rear axle being by means of belts. Sloping hand-wheel steering will be fitted, while the handles controlling the electrical ignition device and the carburettor will be mounted on the steering standard. We are promised further particulars of the new car on its completion.

**An Ex-Mayor of  
Richmond on  
Motor-Cars.**

THE ways of the pioneer are not always easy, as Mr. Hollier is discovering in his effort to promote a motor-car service in and around Aberystwyth. Firstly, he should have been furnished with a copy of the bye-laws, and secondly the police authorities should have warned him before proceeding to two successive summonses. Apparently anything beyond four miles per hour is regarded as furious by the slower minds of certain wiseacres in that little town. We must confess to a feeling of surprise that Sir James Szlumper should have taken the attitude he has, for was he not Mayor of Richmond and is he not an engineer of note? Apparently he overawed his three colleagues on the bench, and was wishful to brand motor-cars as a nuisance. We will not say what we think of Sir James Szlumper.

**An Enterprising  
Croydon Firm.**

QUITE a number of the cycle firms in the London district have been quick to recognise the possibilities of the motor-car movement, and not a few are already laying themselves out to engage in the new industry on a more or less large scale. Among these is Mr. C. F. Miles, of the Onward Cycle and Motor Works, 417 Brighton Road, Croydon, at

whose works we called a few days ago. Mr. Mills has spent considerable time on the Continent in order to make himself *au fait* in automobile matters, with the result that he is now able to undertake repairs to any type of motor-car or cycle. Not only so, but he is making a feature of stocking motor-car

parts of every kind, from a screw to a complete motor. In fact, we were shown, amongst others, parts of every kind for De Dion tricycles, Benz carriages, and Daimler cars, including sparking plugs, springs, pinions, and chain wheels. The works are conveniently situated on the main Brighton Road, and as motor-cars increase in popularity Mr. Mills informs us that he intends to keep his factory open day and night, so that small repairs to motor-cars and cycles can be effected at any hour. Needless to add Mr. Mills keeps a stock of motor spirit on hand to meet the requirements of automobilists.

### The Popularisation of Automobillism.

NEXT to the prominence given to motor-cars in the streets, the attention given the industry in the Press is most likely to popularise it with the public. That being so, the intention of the *Daily Mail* to devote a column every Wednesday to automobilism must be regarded as a noteworthy recognition of the growing number of people interested in horseless vehicles. Our contemporary commences these weekly notes with a general review of the position, and recognises that automobilism "has the advantage of the help of a weekly journal called *The Motor-Car Journal*, a remarkably good pennyworth either from the journalistic or the automobile point of view"—a fact that we are pleased to say has been universally recognised since the first number.

### From Pekin to London.

A MONTH ago we incidentally mentioned a prospective trip from China to London by an enthusiastic motorist who, we may now say, is none other than Dr. Lehweß, of the Automobile Association. He proposes to start from Pekin on a specially-constructed car, the "Koch," burning ordinary petroleum and fitted with a specially-designed burner for the ignition. After leaving China Dr. Lehweß intends to follow the line of the Trans-Siberian railway to the Ural mountains, and thence into Europe. He calculates the journey of 8,000 miles will occupy three months, and the start will be made early next March. We wish this venturesome motorist a good trip, with a minimum of mishaps. But what will John Chinaman think of a foreigner on a motor-car?

### Motor-Cars in the German Army.

It was only last week that we referred, under the heading "War Office and Red Tape," to the refusal given by our military authorities to the request of a number of officers at Aldershot for permission to test the capabilities of motor-vehicles as an adjunct to military equipment. That the question is looked upon in quite another light by the chiefs of the German military department is shown by the fact that both four-wheeled automobiles and motor-tricycles have figured in the manœuvres near Stuttgart during the past week. It is also reported that during the coming winter a conference of competent military experts will be held in Berlin to discuss the question of the introduction of motor-cars into the army, and to issue a report to the Emperor and the War Minister concerning the new departure.

IN the London Road, Southwark, on Friday morning last week, a large motor-van heavily laden with goods collided with a New Cross tram-car and then with a Brixton car. The first accident was but slight, but in the second case the front of the tram-car was much damaged.

MR. FRANK E. BEETON, the secretary of the Dover Show, informs us that the motor race meeting on Wednesday next, the 20th inst., promises to be of an interesting character, as in addition to all the leading English racing men quite a number of French champions are expected to take part.

## JOTTINGS BY A WORLDLING.

IT is all very well to "jot" when you have got something to "jot" about, but it is by no means easy to evolve notes from the results of a week's sojourn at Sunbury. First of all, my local motor observations are *nil*, because I have not seen one car since I have been down here. Indeed, I do not think any one in the neighbourhood has a car except Mr. West, to whom I referred last week; he has been staying here for the summer, and has his tricycle with him; but he does not use it very often, and I have to chronicle the sorry fact that I saw him on a bicycle—the ordinary leg-motor variety!

My own De Dion quadricycle has been a joy to the small boys of the village, who throw their caps on the road before it, shouting "Motah!" the while. Why does the youth of England spoil its head-gear in this way?—a question I have asked many people, but I have not yet found a satisfactory solution to this ethnical mystery. The boys themselves say "Yah!"—or words to that effect. This does not help the student of aboriginal customs. The best suggestion that has been made to me is that it is a form of primitive fetish worship; but my own impression is that it is innate courtesy, and that these caps are thrown on the road to make the path of the motor-car more soft, as Sir Walter Raleigh's cloak was spread under the feet of Queen Elizabeth.

ON Sunday last I was taking a friend for a run when suddenly, just outside Hampton, I saw that one of my tires was down. Now, I am as "keen" as anybody, but if there is one job in this world that I detest it is mending a tire. I hurt my fingers getting it off, I make them dirty and sticky patching the puncture, and I hurt them again putting it on. So I determined to go on and find the village cycle doctor. He was a savage old man, who refused point-blank to help me, and proceeded to give his assistance to an oaf in a Jaeger cycling suit—a frowsy creature who said he was sorry but that he was "on the road," whatever that means. I had to repair the tire myself. *L'èse-automobile* should be punishable by death!

I HEAR that the work at the Automobile Club de France is progressing rapidly and that the splendid building will soon be completed. I have not been in Paris since June, but even in its unfinished state it struck me as the ideal of a modern club house: the best position in the world, a splendid building *meublé* in perfect taste, and a representative membership. What more can one want? I will tell you: A good kitchen and a good cellar for—let me whisper it!—*la cuisine et les vins laissent*, or perhaps I should say *laissent à désirer*.

AND now I have "jotted" to my full.

THE Steam Wagon and Carriage Co., Chiswick, has received an order from Messrs. King & Co., of the Ingersley Vale Bleach Works, Bollington, for three steam lorries for their traffic between Bollington and Manchester, which at present is mostly done by horse-drawn vehicles.

A MOTOR race meeting will be held on the Clarence Park track, St. Albans, on the 27th inst. The well-known English champions, Messrs. Edge, Wridgway and Jarrott, are taking part, as also many other motor-cyclists. We understand that attempts will be made to beat the present English records. The races will be run under Motor-Car Club rules.

# THE RENAULT MOTOR-VOITURETTE.

**A**N example of what can be done with the De Dion motor in its application to light motor-vehicles is to be found in the neat little car which has lately been introduced by Messrs. Renault Frères, of 139 Rue du Point-du-Jour, Billancourt (Seine), of which a general view is given in Fig. 1. The motor, of the latest 2½-h.p. type, is located in the front part of the vehicle, where the air has free access to the radial discs of the cylinder, the ignition being as usual electrical, and the carburettor of the Longuemare type

FIG. 1.—GENERAL VIEW.

Three forward speeds are provided, all controlled by one lever, while a reverse motion actuated by a foot pedal is also available.

As will be seen from the plan (Fig. 2), the motor transmits its power through a friction clutch *B* by a longitudinal shaft which extends through a box containing the variable speed-gear, and by the shaft *H*, which is provided with two Cardan universal joints, to a bevel pinion *g* (Fig. 3) which gears with a large bevel wheel surrounding the differential *J* on the rear road-wheel axle. A view of the variable speed-gear is given in Fig. 4. At the high speed there is very little friction to overcome, for the power of the

FIG. 2.—PLAN OF RENAULT VOITURETTE.

motor is then transmitted directly through the friction clutch *B* and the shaft *M N* (Fig. 4) to the shaft *H* (Figs. 2 and 3). The shaft *m* (Fig. 4) solid with the cone *F* of the clutch *B*, carries a pinion *i*; the latter is, however, free to be moved along the shaft, and is connected with a stepped clutch *E*, permitting the connection between it and the pinions *7* and *8* to be made or broken as desired. With the pinions in the position shown in Fig. 4, the power is being directly transmitted to the rear axle. To obtain the intermediate speed it is only necessary to turn to the right the handle *V* (Fig. 3), which projects up through the floor of the vehicle, near the

driver. This causes the two parts of the shaft *M N* to be separated, and the eccentric shaft *H* to turn on its axis; the result is that the pinions *2* and *3*, loose on the shaft *H*, are brought into gear with the corresponding pinions *1* and *7*, so giving the requisite reduction in speed. By turning the handle *V* to the left the eccentric shaft *I* is rotated, the power being then transmitted through the pinions *1*, *4*, *6*, and *8*, this giving the low speed. It will thus be seen that three speeds, 30, 16, and 8 kil. per hour, are available. A backward motion is also provided, this being obtained by means of a bevel wheel, controlled by a foot pedal, which can be interpolated

FIG. 3.—VIEW OF RENAULT TRANSMISSION GEAR.

between the level pinions *P* on the shaft *I* (Fig. 4). The clutch *B* is controlled by a foot pedal, by means of which also when the motor is thrown out of gear a band brake is tightened on a drum *G* on the longitudinal shaft. Band brakes on the rear wheel hubs, and controlled by a hand lever, are also provided. Steering is effected through the front wheels in the usual way. The wheels are of the cycle type, fitted with pneumatic tires; the body is entirely separate from, and is suspended on, through plate springs, the tubular steel frame. A petrol tank having a capacity of 8 litres is provided in the front of the vehicle; while provision is made for the starting of the motor from the driver's seat. The car has

FIG. 4.—VIEW OF RENAULT VARIABLE-SPEED GEAR.

accommodation for two persons, measures only 5 ft. 10 in. by 3 ft. 4 in., while its weight is given as 4 cwt.

As regards the speed and endurance qualities of the Renault cars, it may be mentioned that they took part in the recent Paris-Trouville and Paris-Ostend races, in each case taking first place in the voiturette class, the time in the latter race being only 9 h. 31 m. Messrs. Farman & Co., of 25 Rue de la Paix, Paris, hold the concession for these cars, and are, we understand, arranging with a firm to take up the sole agency for England.

The Swiss Postal Department is reported to be making experiments with reference to substituting motor-cars for the diligence service in the carriage of mails and parcels.

## MIDLAND MOTOR NOTES.

By "HERCULES."

### The English Car in the Paris-Ostend Race.

I HAD the opportunity of examining the British Daimler 12-h.p. motor-car belonging to the Hon. J. Scott Montagu, M.P., which occupied such a creditable position in the Paris-Ostend race. The vehicle arrived at the Daimler Works at Coventry during the week, and I felt it would be interesting to know how it had borne the strain of such a high rate of speed as was maintained throughout the race. The vehicle has come through the ordeal splendidly. I saw the bearings and other vital parts, and found them to be none the worse for the great amount of work which the car has accomplished since its construction. All that was required was a little attention to the adjustments. The car, I understand, is to be thoroughly overhauled, and its motor-power will in all probability be increased. Mr. Montagu's fine performance with the car, and the favourable impression it has created amongst automobilists in regard to English motors, is a subject of much comment in trade circles. It is stated that one of the gentlemen who accompanied the Hon. J. Scott Montagu, M.P., in this race said at the conclusion: "Well, I have been in for every form of sport—hunting, boat-racing, yacht-racing, big game shooting, sleighing, and so on, but I have never experienced anything so thrilling or perfectly delightful as motor-racing."

### A New Motor Firm.

MESSRS. LINFORD AND WILLSON, of Bellbarn Road, Birmingham, have started in the manufacture of motors, and have, I am informed, orders on hand which will keep them busy for a considerable time. Their factory is an extensive one, and contains a full complement of machinery necessary for the construction of motors, and in addition Messrs. Linford & Willson have laid themselves out for repairs of every description in connection with motors and motor-cars. In short, they are in every way prepared to meet the developments which are bound to come in the motor industry. Both partners are well known as men of extensive experience in cycles and cycle construction. Mr. H. C. Willson gained a thorough practical knowledge of engineering work whilst engaged with one of the largest cycle firms in the United Kingdom, and he has for several years occupied the responsible position of works manager at Bellbarn Road. The commercial side of the business is ably carried out by Mr. Linford, who is in very close touch with most of the cycle agents in the United Kingdom. With such capable management there is no doubt that the firm will enjoy the success which their enterprise deserves. It is a well-known fact that their tricycle was one of the most popular in the trade, and its excellence was such that the firm experienced a fine run of business.

### Rims for Motor-Vehicles.

I MET Mr. T. H. Woollen, manager of the Jointless Rim Co., Ltd., of Longacre, Aston, Birmingham, the other day, and had a long chat with him. This Company have made a speciality in cycle rims for several years past, and have enjoyed a large measure of success; and as Mr. Woollen is a member of the Institution of Engineers, and so well known in connection with the cycle trade, I was not surprised to learn that he is watching the motor industry very closely. It may therefore be confidently believed that as soon as the development of the trade presents the opportunity, the Jointless Rim Company will introduce a rim suitable for the various types of light motor-vehicles. And there is everything to warrant the conviction that the Company will spare no expense to produce a rim which will serve the motor trade as well as their cycle rim has served the cycle industry.

### Motorists at Stonebridge.

IN my notes last week I referred to the popularity of Stonebridge Hotel. When I was there Mr. Oxborrow, the manager, promised to keep a record of the number of motors calling at his house during one week. He now informs me that last week no fewer than forty "put up" at the hotel. The motors were of all descriptions, and many of the motorists were old cyclists who had visited the hotel on many an occasion. Amongst these was a gentleman who was on his way to Manchester with a brand new Daimler car. In reply to my inquiry, Mr. Oxborrow informed me that not one motor throughout the week required the least attention in the way of repairs—a fact which some writers will do well to ponder over. Such well-known riders as Mr. Charles Sangster, Mr. J. W. Stocks, and Mr. S. F. Edge are frequently to be met at the hotel.

### The Beeston Motor-Car.

CALLING at the Beeston Motor Company's works, Coventry, the other day, I was pleased to find that in addition to manufacturing the De Dion motor-tricycles and quadricycles, upon which there has been a great run during the present season, the Company have begun to build light motor-cars. I had the opportunity of examining the parts for their first car, which, when completed, will be a very handsome turn-out. The motor will be of about  $3\frac{1}{2}$  h.p., and the weight of the car something like 5 cwt. It will be a motor "built for two." There will be two effective band brakes—one applied by the foot, and the other by the hand; two speeds, electric ignition, and it is claimed that the car will be able to climb any hill which can be negotiated by a horse and trap. The form of the vehicle appears to give a very comfortable position to the passengers, whilst the steering apparatus, gear clutches, etc., are very neatly arranged, and in such small compass that no inconvenience will be felt by either of the passengers. The car will not be ready for a little time yet; when it is, I have been promised a run in it. In its construction aluminium is used as much as possible in portions where there is no strain. The run I made round the Beeston works was exceedingly interesting. Everything connected with their motors is manufactured on the premises, and every point in motor construction is touched. There are turning, casting, enamelling, plating, and finishing shops; whilst another portion of the extensive premises is devoted to experiments. I observed a motor-tricycle which had come in for some slight repair, and was informed that this tricycle was owned by a gentleman of independent means, who practically passes the whole of his time in making tours through the country. During the past two months, he told the firm, he was in North and South Wales and the West of England, and within the period named he covered something like two thousand miles. The motor, he added, had given him very little trouble indeed, and he was perfectly satisfied with its behaviour.

### Trouble Brewing.

IT is well known that the Beeston Motor Co. were the first firm in England to look favourably upon motor-propelled machines, or, in other words, had sufficient pluck to venture upon their construction. Most people are ready to give the firm the praise which is due to the pioneers in any industry, and to acknowledge that the motor-machines they have turned out right from the start are a credit to the makers. That, I venture to assert, is the general opinion of those who have had any experience with the motor-tricycles manufactured by the Beeston Motor Co. But, like other pioneers, this Company has not escaped attack. One discordant voice has at length made itself heard, or, to be accurate, one rider has seen fit to enter into a correspondence in a contemporary in reference to a machine

which he says was made by them. Mr. Gorton reverted to this correspondence whilst I was with him the other day, and said he thought it was most ridiculous for any man to compare the machines made three years ago with those turned out at the present time. The motor-tricycle made three years ago was an exact facsimile of the then French model, and, in his opinion, one might just as well compare the bone-shakers manufactured by a high-class firm of twenty years ago with the up-to-date bicycle of a high-grade maker to-day. The assertions made by a writer who had not the courage to append his name to his letter will most probably form the subject of an action in the law courts. It is gratifying, however, to know that the firm are constantly receiving letters from customers whose experience of the Beeston motors have been exactly the reverse of those of the writer referred to.

#### The Fleet Specialities.

I HAD A run over the premises of the Fleet Carriage and Wheel Company, Fleet Works, Coventry, a day or two ago, and found the firm exceedingly busy. The Company deal very largely in solid rubber tires, the wearing surface of which is guaranteed for a period of twelve months. They claim that their tire does not strip, and that the "tread" cannot be easily damaged or cut by the thousand and one things which are to be met with on all roads. It is made in all sections and sizes. This Company also make a speciality in wood wheels, to which either solid or pneumatic tires can be fitted. Rubber mats and trimmings generally for motor-vehicles are dealt with in another department. I noticed in one of their shops that several cars had been sent in by motor manufacturing firms to pass through the finishing process—for which the firm have excellent facilities—and amongst these was the body of a vehicle for Mr. W. K. Welch. Although this firm has been in existence scarcely more than six months, their business is growing rapidly, and the management is, I am told, already being compelled to look out for larger premises. This is not surprising, seeing that the partners have had large experience as coachbuilders, and are intimately acquainted with the requirements of the motor industry, with which they have been associated from its introduction into this country.

#### Clipper Tires.

THE Clipper Tire Company, Ltd., (Aston Cross, Birmingham), who have been connected with the cycle trade for a considerable period, and during the past few years have gone into the front rank of cycle tire manufacturers, are now supplying tires suitable for light motor-vehicles. From the appearance of the tire, which is of the Clincher type, and the principles on which it is constructed, there can be little doubt of it giving every satisfaction. The rubber used is of the very best, and it has gone through the best test possible—actual wear and tear on thousands of cycles. The Company have shown much foresight in thus preparing to meet the demand which will undoubtedly be experienced next year for good tires for motor-vehicles.

#### A Cycling Authority on Motors.

FOR A number of years Mr. W. F. Ball has been the special correspondent for the *Birmingham Daily Mail* on all matters connected with cycle construction, tires, racing, etc., and he is well known in the Midlands as an authority on these things. On Saturday the daily referred to above contained an article from the pen of Mr. Ball describing "A Ride on a Big Motor-Car." He had the pleasure of a fifty mile run with Mr. Bird, of Moseley, one afternoon last week. "Mr. Bird is," he says, "above all things a careful driver, and wended his way up the busy, tram-lined main street of King's Heath at a slow speed, but in a manner which showed perfect command over the car, that seemed

to lack nothing in its equipment which could be added to the safety of the public." His attention was arrested by the brakes with which the car was provided, and the effective way in which they were used by Mr. Bird. "Two of the brakes," he says, "were quite sufficient to hold the car in and take the somewhat heavy vehicle down Parson's Hill into Kings' Norton at a walking speed. Later on, however, we shot up a short, steep rise and over the top so fast that I thought for a moment we must certainly be launched into space. Gravity, however, held its own, and so, although I for one felt as if I had left my soul floating above, our bodies and the car under them dropped like a bolt from the blue into the dip; and here again, on approaching a corner, the car was slowed down to six miles an hour in no time, and that without any jerk or sensation of the brake's effect at all. Out in the open country and on wide, easy highways they ran beautifully. The pace was fairly fast at times, but the steadiness and smoothness of the motion were wonderful. The good springs of the full roadster pneumatic tires completely absorbed all ordinary inequalities of the road. Some of the horses met on the road displayed marked signs of fright, and others regarded the new-fangled vehicle with indifference." The best bred and best driven horses, as it appeared to Mr. Ball, were the least disturbed by the approach of the car. Some of the rougher animals ridden by tradesmen's youths or farm hands gave some trouble, but, adds the writer, "it is evident from the number of animals which already have lost all fear of motor-cars that a very short time must elapse before all horses will be as little disturbed at the appearance of one of these vehicles as they are now at a bicycle." The ease with which the car was steered was also noted by the writer, who goes on to describe how the four speeds were utilised with best possible results. The famous ascent at Gorgot was easily mounted at "the slow but useful pace of about six miles an hour." After speaking of the experience and judgment which is required in the use of the speed gears, Mr. Ball concludes: "Looking out from the 'box seat' of the car, with cyclist eyes, I could not fail to be struck with the fact that a big motor-car does not have to encounter a tithe of the difficulties with pedestrian travellers which fall to the lot of the more lowly wheelman. The car enjoys quite all the advantages of the carriage and pair on this point, for when either of these vehicles makes its appearance people on foot immediately give way. They forget all about their 'first right to the road,' and run if need be rather than risk either collision or argument with such substantial drivers. The boys do not throw their hats at you when you are sweeping down the road on a big motor, neither do the roughs form a line across the street, or try to put sticks in your wheel. To set against these advantages motor-driving calls for a far greater concentration of attention than is necessary in open country when steering a bicycle. Motoring, too, is undoubtedly an expensive hobby, but, for all that, it is a rational and sensible as it is an interesting, not to say fascinating, art and amusement for those who like it and can afford it."

#### The New Grappler Pneumatic Tire Company, Ltd.

WITH reference to the paragraph in last week's issue, I am informed that it was written under a misapprehension. The "New" Grappler Pneumatic Tire Company, Ltd., are old vehicle and motor-tire manufacturers, and have, I understand, been dealing with this class of work for a period of seven years.

At the last meeting of the Arundel Town Council Alderman Rolls called attention to the danger attending the passage of motor-cars through the narrow part of Tarrant Street, near the square. He suggested that the Works Committee be entrusted with the task of putting up a notice warning motor-car drivers regarding the manner in which they entered that part of the town, and moved a resolution to this effect, which was carried unanimously.

## THE BRITISH MOTOR INDUSTRY.

**G**REAT things have happened in the British motor-car industry since the British Motor Daimler Company's carriage appeared in the Lord Mayor's procession in 1896; but despite all the changes the British Motor Company has developed with a steady consistency that has surprised many opponents and certainly gratified every supporter.

The list of motor manufacturers now under licence to this Company is a very imposing one, comprising most of the English firms who are going ahead as leaders in the industry. They all recognized the value of the British Motor Company's patents, and the number of machines running under its licenses is increasing every day. Not only are they thus demonstrating the commercial efficiency of the British motors, but in obtaining medals and other distinctions on the racing track the licensees of the British Motor Company have been most successful, and last week the window of the Company's establishment on Holborn Viaduct was, for the time being, not unlike a jeweller's display with its assortment of gold and silver plate won by Messrs. Jarrott and Edge on machines built under the Company's patents. Their marvellous speed in racing has created a great sensation. At the Crystal Palace, on Wednesday, Mr. Jarrott won the championship, beating all records.

Of course, the reason of the success which has attended the Company's operations is found in the hundreds of patents which it holds—a number greater than that owned by any other British firm, and the value of which may be inferred from the records held by machines built under the Daimler, Pennington, De Dion, Bollée, and other British motor patents. Owning so many patents, small wonder is it that it has had to defend its rights in the law courts. During the last two years nine different actions for infringing patent rights have been brought and won; the last judgment alone being equivalent to an injunction against some hundreds of users and infringers in this country. Unfortunately, many innocent purchasers have been affected by this case. So far the British Motor Company has had a steady career of success, and the caution with which its progress is now being directed indicates that a strong position is being built up—based upon conditions that the foresight of the promoters have steadily borne in mind from the beginning of the industry:—

Following upon the boom which all are anticipating to take place in the last year of the old century, great developments are likely, we learn, to be made by the British Motor Company, and their advent will assuredly be watched with interest by all concerned in the advance of a business whose extent will shortly have no limitations.

## THE AUTOMOBILE CLUB'S AUTUMN TOUR.

**W**E have already published a rough outline of the autumn tour of the Automobile Club which starts to-morrow. We are now able to give the final programme.

Saturday, September 16th: London to Folkestone, *via* Maidstone, 77½ miles. 10 a.m.—Leave Club, proceeding *via* Westminster Bridge Road, Kennington Road, then (on crossing the Clapham Road) to the left along the Brixton Road, to a little beyond Brixton Station, then to left up Effra Road and Tulse Hill, across Norwood Road, along Thurlow Park Road, and to right along College Road, past Dulwich College to Crystal Palace, thence to left down West Hill, over railway bridge at bottom and straight on to South End (*not* Southend-on-Sea), where the Sevenoaks main road is reached; turn to right along Sevenoaks Road and on to Bromley (13 miles). (R. 47) Farnborough (17 miles), Riverhead (25 miles). At "Amhurst Arms," Riverhead, turn to the left. (R. 134) Seal (27½), Ightham (31 miles), Wrotham Heath (34 miles), Maidstone (42½ miles). 2 p.m.—Luncheon

at the Royal Star Hotel at Maidstone. 3 p.m.—Leave Maidstone for Folkestone (R. 32), 35½ miles, *via* Charing, Ashford, Hythe, and Sandgate. 8 p.m.—Dinner at Wampach's Hotel, Folkestone. Sleep at Wampach's Hotel, Folkestone.

Sunday, September 17th: Leave Folkestone by boat (11.5) for Boulogne to see termination of the automobile race, Paris to Boulogne, organized by the proprietors of *La Vie au Grand Air* in connection with the Congress at Boulogne of the French Society for the Advancement of Science. Leave Boulogne 7.55; arrive Folkestone 9.50. Supper at Wampach's Hotel, Folkestone. Sleep at Wampach's Hotel, Folkestone.

Monday, September 18th: A day tour. Suggested tour, liable to variation: To Canterbury, 22 miles; Canterbury to Margate, 16½ miles; Margate to Sandwich, 8½ miles; Sandwich to Deal, 6 miles; Deal to Dover, 8½ miles; Dover to Folkestone, 7½ miles; total, 68½ miles. Dine and sleep at Wampach's Hotel, Folkestone.

Tuesday, 19th September: Drive to Dover, and there take part in the inauguration of the Automobile Exhibition (organized by the Mayor of Dover, with the co-operation of the Automobile Club) in connection with the meeting of the British Association at Dover. There will be motor-cycle races on the track. Dine and sleep at Folkestone.

Wednesday, September 20th: Return to London.

Some members may possibly prefer to attend the Congress of the Automobile Section of the French Association at Boulogne, on Monday, the 16th inst., instead of taking part in the day tour. The programme is as follows: 8.30 a.m.—Congress opens; discussions on the question of "Automobilism"; M. Pasqueau, Inspector-General of Bridges, will read a paper on "The Transport of Automobiles on Railways"; M. Bricka, Inspector-General of Public Works in the Colonies, will read a paper on "The Employment of Automobiles in the Colonies"; and M. d'Abartigue a paper on "Wheel Gauge of Automobiles." 10.30—Visit to the Automobile Exhibition. 2.10 p.m.—Procession of Concours d'Elegance. A paper will then be read before the Fourth Section by MM. Mesnager and Cuénod, the subject being, "Automobilism on the Road, as regards the Motor, the Vehicle, and Traffic"; the subject is to be treated from three standpoints: (1) historic, (2) study of the elements of automobiles, (3) the future of automobilism—the reforms to be wished for.

Members are particularly requested to see that motor-vehicles taking part in this tour are on no account driven at a speed exceeding the legal limit—twelve miles an hour—and that the vehicles are driven slowly in traffic, in passing through towns and villages, and especially where children are playing near or on the road-ways. Petrol may be obtained from E. Allcorn, 30 Stone Street, Maidstone; William Francis, 66, High Street, Folkestone; while accommodation for the storage of motor-vehicles will be provided by C. Huntley, Bouverie Mews, Folkestone, at 1s. 3d. per night.

THE Gordon Cycle and Motor Co., of 140 Seven Sisters Road, Holloway, is to be added to the list of firms in the London district holding a stock of motor-car spirit. The Company is also in a position to undertake repairs to motor-vehicles, and has ample accommodation for the storage of motor-cars.

MR. CHAS. T. CROWDEN, Motor Works, Leamington, informs us that he has now an extensive stock of parts and fittings, such as valves, springs, pumps, governors, piston-rings, etc., for motor-cars by the best known makers (Daimler, Panhard, Benz, De Dion, Mors, etc.), together with a selection of electrical sparking apparatus, including batteries (both primary and secondary), coils, sparking plugs, switches, insulated wire, lamps, and binding screws; platinum tubes, burners, etc., for lamp ignition are also kept. Mr. Crowden is now prepared to undertake the prompt execution of repairs and renewals to all makes of cars.

# CORRESPONDENCE.

## UP AND DOWN CUMBRIAN FELS ON A MOTOR-CAR.

To THE EDITOR OF *The Motor-Car Journal*.

SIR,—I thought last week's record of our achievements would be the greatest I should ever have to tell, but the past week's experiences certainly go one—nay, two, or even three—better than its predecessor. Kirkbride Marsh will ever be a memory to me of what a Daimler motor can do, but our hill-climbing since that adventure is, I am quite sure, phenomenal. The route after leaving Egremont, Cumberland, was Calderbridge, Eskdale Green, Ravenglass, and Broughton-in-Furness, and of this journey I would like to give you some particulars. At Egremont, thanks to the excitement caused and advertisement obtained by the first appearance of a motor-car, my receipts in one night nearly equalled those of two nights on a previous visit, the hall-keeper remarking that it was the biggest house he ever saw there.

The journey to Calderbridge was only five miles, and we stopped *en route* at Beckermest in order that I might renew my acquaintance with the worthy schoolmaster, Mr. Brown, who marshalled his scholars to the windows of the school to see what he termed "the carriage that went without a horse," and, apart from this, the journey of that day was void of further interest; but Calderbridge to Eskdale Green was the journey that established yet another record, and of our ascent and descent of Irton Fell no word-painting of mine could give an accurate idea. When I approached it at Santon Bridge I confess I felt it would be impossible. The "fell" was sandy, sharp and nasty-looking flints protruded here and there, but either we were to climb it or lose the night. We all three dismounted, thinking the car with its 8 cwt. of baggage was quite enough. On—on we went, slowly yet surely, Mr. Sinclair guiding the steering-handle from the ground, Mr. Lax and myself gazing sympathetically from either side, and gradually we neared the top. At last the summit was reached, and, as we gazed back, we had a lovely view of an enormous expanse of country—the Irish Sea

fully three-quarters of an inch in the rubber. Eskdale rewarded us with a "record" house.

The next day, to get to Ravenglass, we were told that a worse place than Irton Fell stood between. A dreaded spot, justly termed "Sandbank Hill," where quite recently a traction engine, in attempting its ascent, stuck fast in the middle, and had to ignominiously return. An alternative was suggested, viz., "Would Lord Muncaster allow us to use his carriage drive, and so avoid this terror of a place?" I wired his agent, Mr. Watt, of Ravenglass, to grant

permission, but he regretfully refused, saying some of the bridges were weak—he evidently thinking the wagonette was a much heavier affair than it really is; but I must do him justice to say that when I saw him afterwards at Ravenglass he was sorry he did not consent.

Well, off we went: either we must climb Sandbank Hill or miss a night. When we reached its base the cause of its terrible condition was quite apparent: they were erecting a new building there, and "leading stone," as it is termed, had helped considerably to make it in such a state. I went forward and prospected, and came to the conclusion that it would be madness to attempt it without assistance, so I went to the foreman on the works, who fortunately had witnessed our entertainment the previous evening, and, being very pleased, had quite an interest in us. He instructed two of his men to unyoke their horses and hitch them tandem-wise to the car. With motor working, horses pulling, Mr. Sinclair at the helm, and myself ahead shouting orders how best to miss the huge boulders embedded in the sandy ground, and projecting in many instances at least six inches above the surface, we soon were on the top. Thence to Ravenglass was easy sailing, and at night another "bumper."

I notice the Daimler Motor Co., Ltd., in their advertisement, speak of the 79½ stones taken up a hill during the hill-climbing contest; but surely these hills that we have done must be mountains indeed in comparison to the one selected for the contest, and my motor—their motor 1122—should be proudly referred to by them, as to what it can accomplish. If we go on as we are going throughout the tour, I think I must try and arrange to bring my car and show it at your next exhibition—"A magnificent proof of the merits of the motor."

I must not trespass on your space to detail more this week, only to say that I enclose a number of photos taken by Mr. Daire, of Silloth. The first will be of interest as showing the original Carmont's shielded rubber tires, which I had replaced by "Clincher" new section 227 at Edinburgh. It was taken just before I started with my family to Linlithgow for an afternoon trip; the second photo is interesting as showing our appearance when loaded up for present tour. One item I ought not to forget. A doctor, near Millom, as we passed, said when he saw the car, "That's what I want, and what I will get." Yours, etc.,

T. J. WEST,

Broughton-in-Furness,  
September 11th, 1899.

Manager, "Modern Marvel"  
Co., Ltd. (of Edinburgh).

glistening on our right, and the Isle of Man clearly defined in its midst. Near the top of the mountain was a charming residence, which appeared to be full of guests, and quite a bevy of ladies watched our progress, and one gentleman, who said he was much interested in motor-cars, warned us as to the wretched nature of the declivity we now had to negotiate ere reaching Eskdale. It was really worse than the ascent, but down we went "all aboard," and at the bottom picked out of one of our front tires a piece of flint that had buried itself

## A SURFACE INDICATOR FOR MOTOR VEHICLES.

TO THE EDITOR OF *The Motor-Car Journal*.

SIR,—Referring to the notice and illustration of a surface indicator in your issue of September 1st, the description you give of its method of registering is, I think, hardly correct.

If you will just look at the hand and the way it works you will see that a hill of one in eight is indicated less steeply than one in twelve, and that one in two is actually a still slighter gradient than one in eight or one in twelve.

I have one of these instruments myself, and when I first got it I could not understand how it was supposed to read, but I find it is divided into hundreds, and when the indicator points say to eight it means eight in a hundred, which is, roughly speaking, about one in twelve, and so on right through the figures shown on the dial. It is very reliable, and interesting in action.

7 Tavistock Chambers,

Hart Street, W.C.

September 9th, 1899.

Yours truly,

S. F. EDGE.

## AN EARLY STEAM CAR.

TO THE EDITOR OF *The Motor-Car Journal*.

SIR,—May I call your attention to an error in your issue of September 1st, in which you give an engraving of what is said to be Mr. Loftus Perkins' steam carriage. This is not, however, correct, as it is a copy of a block in the autobiography of Mr. Richard Tangye, entitled "One and All," and represents the steam carriage built by him in 1862, as you will see by reference to Mr. Fletcher's well-known work, "Steam on Common Roads," page 165. Thanking you in anticipation,

Cranbrook,

September 11th, 1899.

I am, yours faithfully,

"PRECURSOR."

## A DANGEROUS HILL.

TO THE EDITOR OF *The Motor-Car Journal*.

SIR,—A timely warning may perhaps save some of your readers who are likely to be touring in this district from severe accidents. On the road from Thirsk to Helesley there is a hill known as "Sutton Bank." Last Sunday I attempted its ascent on a 6-h.p. Panhard car, and only with the help of another man and frequent rests were we able to get to the top.

In my road book it is described as "a very dangerous, rough, and precipitous bank," with an average gradient of 1 in 8. This hardly describes it, as on several of the steepest parts the clinometer needle on my car went right off the scale; the surface is abominable—very rough, and loose. It is about a mile long, coming right off the top of the Hambleton Hills, and its descent is a thing to be avoided. The natives on the top informed me that only one car had been down before, and it broke the brakes in the first hundred yards and had to be cautiously let down with ropes tied on behind. It is the worst and most dangerous hill I have ever seen, and it cannot be too assiduously avoided.

Northallerton,

September 11th, 1899.

Yours faithfully,

J. ERNEST HUTTON.

## PROSECUTION OR PERSECUTION AT ABERYSTWYTH.

TO THE EDITOR OF *The Motor-Car Journal*.

SIR,—I beg to call your attention to a prosecution that has taken place here this week. In the first place I must start from the time of arriving in Aberystwyth with my motor chars-a-banc. This was August 7th, on which day I took out my licences, but was not supplied with any copy of the bye-laws. From August 8th to August 22nd I worked without any complaint or hindrance; on the night of August 22nd the sergeant of police told me to ask my driver to go

slower round corners and also on crossing street-ends or squares. In the presence of the said sergeant I told Doig, my driver, not to exceed seven miles per hour on the straight, and not to turn corners at a greater speed than three miles per hour, and at this rate we continued to work.

To my surprise my driver was served with a summons on the night of September 2nd, this summons being made out for August 22nd and returnable for September 6th. The summons was worded as follows:—"That on the night of August 22nd, 1899, you did wilfully, wantonly, and furiously drive a motor-car, to the danger of life, limb and property, at a rate exceeding four miles per hour."

I, of course, defended the case, but to no use. On the bench were four J.Ps.—two of them drapers, one a retired painter, and one gentleman, Sir James Szlumper, late Mayor of Richmond. The first three had nothing at all to say, and before any defence was properly allowed Sir James Szlumper practically sat on us, and it was plain to be seen we should not get justice. The verdict was 10s. and costs, with a strong expression of feeling from Sir James that motor-cars were a nuisance, and that the public would do their best to put them down. Now I ask you, Is this justice? and can a bye-law, made in 1884 by a small town of then about 5,000 inhabitants, over-rule the newer laws relating to light locomotives? I was going on to say more, but—judge of my surprise again—they have now just come and served a second summons for a similar offence, *i.e.*, furiously driving a motor-car to the danger of life and limb on a certain highway at Goginian. This is a small scattered village on the mountain side, seven miles from Aberystwyth, and in this case the offence took place on September 4th, but will not be heard till the 28th inst., and then at another village nearly five miles away from where the alleged offence took place!

The question I ask is: Is it prosecution or persecution—which? I have now resided here seven years, and have done my best to improve the place in all ways, and when last summer I saw here a small, worn-out Benz car, which snorted and smoked abominably, I made up my mind to have a good car, one to be a credit to the town and owner and patrons alike. After visiting the various shows I decided on one of the Motor Manufacturing Company's chars-a-banc, to carry eight passengers. On arrival in Aberystwyth with the car I was congratulated all round, and have carried over 3,000 persons on it without complaint; and yet a narrow-minded bench bring an obsolete bye-law to bear, and convict without furnishing bye-laws or warning, and again follow up by issuing a second summons for an offence taking place seven miles away on a highway where at any time not more than twenty persons would be seen for three or four miles!

It is very annoying, and I shall be pleased to hear from you or any one else interested what are the best steps to take.

Thanking you in anticipation,

Aberystwyth,

September 9th, 1899.

I am, yours truly,

W. H. HOLLIER.

## THE LONDON ELECTRICAL CAB CO., LTD.

TO THE EDITOR OF *The Motor-Car Journal*.

SIR,—It is time the shareholders in this Company were furnished with information as to its position and proposals regarding its future. I wrote to the managing director a long while ago to this effect, and received in reply an intimation that a statement would be sent to the shareholders "in a few days." After waiting about a fortnight, I again wrote (nearly three weeks ago), but have had no reply to my letter; neither have I seen any statement in *The Motor-Car Journal*. Surely it is time the shareholders took the matter up; and I trust some of the more influential members will combine and see what can be done. We were led to understand that the directors were running the small number of cabs at a profit, and the extension appeared to indicate rosy prospects, so the unexpected collapse seems to call for explanation. It would appear that the Company have splendid technical manage-

ment but is somewhat deficient in business capacity; with the two combined, success should be assured.

Apologising for troubling you with this letter, which is necessitated only by the want of attention by the officials of the Company,

Bristol, I am, yours truly,  
September 11th, 1899. A SHAREHOLDER.

## MOTOR-CARS ON THE CONTINENT.

(From Our Own Correspondent.)

### Automobile Wrecking.

THE miscreant who amuses himself by attempts to wreck trains—attempts which, unfortunately, are often only too successful—would appear to be extending the sphere of his operations.

Quite recently we have had the accident at Deauville, caused by a youth maliciously placing large stones in the road, while but for the timely discovery of the horrible contrivance on the roadside near to Cabourg some terrible mishaps would undoubtedly have occurred. And now we learn of the attempt against a well-known Grenoble automobilist, M. Duchemin, on the 3rd inst. M. Duchemin and his mother and brother were returning in an automobile from Saint Gervais to Grenoble, and when travelling at a speed of about twenty miles an hour they observed three men on the roadside ahead of them. One of these men, as the car passed him, hurled a pole nearly six feet in length at the head of M. Duchemin, who would have been seriously injured had not his mother guarded the blow. Promptly stopping the car the MM. Duchemin, aided by two cyclists who had witnessed the attack, succeeded in capturing two of the men, the actual perpetrator unfortunately making good his escape. He is, however, known, and will doubtless be speedily arrested.

### The Department Seine-et-Oise and Motor-Car Races.

THE general council of the department of Seine-et-Oise have requested M. Poirson, the préfet of the department, to prohibit automobile races taking place in his district. Monsieur Poirson has, however, since then granted authorisation for the race Paris-Boulogne, but solely on condition that during their passage through Conflans, Saint-Ouen-l'Aumône, Pontoise and Eragny the competitors rigidly observe the law. The chief engineer of the department will also attend the start on Sunday next at Saint Germain, and will permit no vehicle to compete without bearing a number conspicuously displayed.

### M. Lemaitre's New Racing Car.

WE learn on good authority that at no far distant date M. Lemaitre will be seen racing on his new Peugeot car fitted with engines developing no less than 52 h.p.!

### Recent Races.

ON Sunday last fourteen amateur motor-cyclists took part in the Paris-Péronne race. The start was effected at Saint Germain at 10.10 a.m., and the first man arrived at Péronne at 1.55.12, having thus covered the course of 180 kilometres in 3 h. 45 m. 12 s. The order was:—1, Ducom; 2, Ricard; 3, Collignon; 4, Régnard; 5, Tonrao; 6, Nevers. Ducom also won the race of 10,000 metres held on the track later in the day, being followed home by Reynier and Bathiat in the order given. On Monday Sebilleau won the Dinard-Saint-Brieuc course, the other placed men being Bertin, Berthon, and Poirel. The distance was 135 kilometres, and the winner's time 2 h. 51 m. 28 s.

### Motor-Cycle Accidents.

WHEN one considers the enormous number of motor-cycles in daily use in France it is at once evident that the sport is singularly free from accidents. Occasionally mishaps occur, however, and during the last few days two motor-cyclists have suffered rather serious injuries. At Saint-Etienne, M. Sirdey collided with an omnibus, and had both an arm and foot badly injured, while in the case of M. Godchaux, at Vittel, the unfortunate rider is suffering from a broken arm and severe contusion.

### The Hour Motor-Cycle Record.

ON the Tuesday following the Paris-Ostend race, at the Parc des Princes, Baras succeeded in beating Osmont's record for the hour, which has stood since August 5th, by 781 metres. But his glory was only short-lived, for four days later on the same track Osmont recovered his title of record man, but only by the narrow margin of 35 metres. Baras rode a Perfecta tricycle with De Dion motor and Osmont a Phébus with Aster motor. We append the two sets of figures for the purpose of comparison:—

| Kil.                 | Baras. |     |                      | Osmont. |     |
|----------------------|--------|-----|----------------------|---------|-----|
|                      | m.     | s.  |                      | m.      | s.  |
| 10                   | 9      | 24½ | ..                   | 9       | 24½ |

### Bordeaux-Biarritz Race.

THE committee of the Biarritz fetes have just issued particulars of the automobile race which they are organizing for September 30th and October 1st, and although somewhat far afield, we hope that the inclusion of a category for tourists may tempt some of our English "chauffeurs" to compete. We know of one English car, a 12-h.p. Daimler, which runs regularly in the delightful country surrounding Biarritz and San Sebastian, so we may possibly again see this type of car in competition with those of continental manufacture. The category for tourists is divided into three classes: A. Cars of 6 h.p. or less (1) carrying at least two persons, or (2) carrying at least four persons; B. Cars of more than 6 h.p. (1) carrying at least four persons, or (2) carrying at least six persons; C. Motor-cycles and voiturettes, weight not exceeding 400 kilos., (1) carrying one person, or (2) carrying at least two persons. For the racers provision is made for cars weighing more than 400 kilos., motor-cycles not exceeding 250 kilos. in weight, and voiturettes weighing less than 400 kilos. The course of 281 kilometres is by way of Langon, Auros, Grignals, Casteljaloux, Mont-de-Marsan, Saint-Paul-les-Dax and Bayonne, the tourists traversing the distance in two stages while the racers are required to complete in a single day. Entries should be sent to M. Henry Borotra, 4 Avenue de Grammont, Biarritz, the latest date being the 23rd instant. After the race there will be a series of automobile fetes, etc., at Biarritz.

### Nice-Puget-Théniers Race.

FAVoured by magnificent weather, this course, promoted by the Automobile Club of Nice, was decided on Sunday last. After the showers of the previous evening the roads were in excellent condition, but the competitors were somewhat impeded by the presence *en route* of a herd of cattle. The result was as follows:—Carriages: 1, Meyan, 1 h. 41 m. 12 s.; 2, Andréis, 3 h. 7 m. 10 s.; 3, Garin Clovis, 3 h. 10 m. 42 s.; 4, Laward, 3 h. 16 m. 54 s. Motor-cycles: 1, Portal, 1 h. 37 m.; 2, Garinén, 1 h. 54 m. 22 s.; 3, Girelli, 2 h. 4 m. 50 s.; 4, Régis Gayraud, 2 h. 21 m. 12 s. The distance was 65 kilometres, or 40½ miles.

### Automobiles in Italy.

At Turin there has been held recently a meeting of capitalists at which it was decided to form a company for the purpose of instituting public service of automobiles in various parts of the country.

### The Paris-Boulogne Race.

This race, which is fixed to take place on Sunday next, the 17th inst., is divided into three categories—cars, voiturettes, and motor-cycles. Amongst the entries to date are: Cars—Antony (Mors) and Girardot (Panhard); voiturettes—Popp, Dulac, Lefevre, Filtz, Debacker, V. 4, Vallée, Layeye, and Epheniere; motor-cycles—De Madec, Caron, Cormier, Gars, Marot, Bardin, Gleizes, Nicolas, Baras, Lenaux, Beconnais, Petit Jeanet, Sevette, and Ovary. The entries in the voiturette class include two “Stanley” steam cars, which are making their first appearance in a French course. Their performance will be watched with much interest, as in many quarters high opinions have been formed of their capabilities.

### The Late M. L.-V. Lockert.

We regret to learn of the death at Berck-Plage on the 6th inst. of M. Louis-Victor Lockert, the Editor of our French contemporary, *Le Chauffeur*. The deceased, who was only 56 years of age, was a well-known engineer and a member of the French Automobile Club.

### A Trip through Europe.

CORRE, the well-known Paris-Brest record-holder, started a few days ago for a long tour through Germany, Switzerland, Austria, and Italy. A curious incident happened to Corre, who is now at Milan. While going over the Simplon Valley he was arrested, for it is forbidden to cross the Simplon on a motor-car, and it was only with great difficulty that he was allowed to proceed. This long excursion is being attempted on a Renault car, described in other columns of the present issue.

### The Next French Heavy Motor-Car Competition.

THE third *poïd lourds* or heavy motor-car competition organized by the French Automobile Club is to be held from October 5th to 11th next. The competition is open for (1) vehicles capable of carrying ten passengers each with 33 kilogrammes of luggage, exclusive of the driver; (2) delivery vans capable of carrying at least a ton; and (3) vehicles capable of carrying both passengers and goods of a total minimum load of 1 ton.

At the last meeting of the Great Marlow District Council the Public Works Committee brought forward the following resolution: “That this Council regret that cycles and motor-cars are driven a great deal too fast through the town, thereby causing danger to the inhabitants and visitors. We therefore ask the special co-operation of the police to prevent the same, and that a letter be written to Sergt. Marks embodying this resolution.” The resolution was adopted.

It appears that there are now sixteen motor-cars plying for hire in Newcastle, and that more are expected, as twenty-eight licences have been obtained from the authorities. The Watch Committee at their meeting last week agreed to recommend the Council to fix the following motor-car stands:—At the end of Blakett Street, near the Presbyterian Church; in Neville Street, between the hotel and the large lamp leading to the portico of the Central Station; on Scotswood Road at Greenhow Place; at Hamsterley Road near Northbourne Street; at the top of Westgate Hill; one on Brighton Grove, and another in Lily Avenue, Jesmond.

## THE UNIVERSAL MOTOR-TRICYCLE SADDLE.

—8—

QUITE a number of saddles specially adapted for use on motor-tricycles have lately been put on the market. Among these is the “Universal,” of which we give an illustration herewith. As will be seen the saddle gives a wide seat, while a special feature is the

provision of a support for resting the rider's back. The new saddle is of French construction, and is, we understand, being largely used by motor-cyclists in France. It is being introduced into this country by the United Motor Industries of 3 Rue Meyerbeer, Paris.

MR. C. HAMMERSLEY, cycle agent, 9 Hospital Street, Nantwich, would like to receive catalogues and price lists of horseless vehicles.

In addition to firms mentioned in our last issue we learn that the Hurtu car will be exhibited at the Dover show next week by Messrs. Marshall & Co., of Manchester.

MESSRS. HAYES AND THOMPSON, of the Griffiths Cycle Corporation, Limited, Prince of Wales Road, Norwich, have purchased a large 5½-h.p. Daimler motor-wagonette, with all the latest improvements, and are now running the same between the market place and Thorpe at a popular price. This is the first motor-car in Norwich to run for public service.

WITH reference to the De Dion motor-voiturette described in our last issue, and the statement that the United Motor Industries of Paris are introducing the car into this country, the Automobile Association of Prince's Road, W., write us to say that this is not quite exact, as Messrs. De Dion & Bouton are under contract with the Association to let them have the first voiturette which is shipped to England.

AN automobile gun-carriage, upon which a Colt automatic rapid-fire gun will be mounted, is now being constructed at the Duryea factory in Peoria, Ill. It is being made to the order of Major Davidson of the Highland Park Military Academy. The vehicle will be a three-wheeled affair, seat four men, provide for 1,000 rounds of cartridges and weigh about 1,000 lb. Major Davidson intends to run it overland to Washington, where an effort will be made to interest the U.S. army officials in the vehicle. In connection with the subject of automobile gun-carriages, we understand that the Pennington “torpedo” is being fitted with a Colt rapid-fire gun, and will be shown at Dover next week.

## THE BERLIN INTERNATIONAL MOTOR-CAR EXHIBITION.

WITH the exception of one or two firms, very little was for a long time done in connection with motor-vehicles in Germany as compared with the attention given to the movement in France and in this country. That a change has taken place within the past twelve months and that at no distant date Germany will cut a very prominent figure in the motor-car industry is evidenced by the large collection of vehicles which have been got together

FIG. 1.—THE KRIEGER VICTORIA.

by the Mid-European Motor-Car Club at the international exhibition which opened on the 3rd inst. and will remain open till the 28th inst. Applications for space came in so rapidly on the organizers that several additions to the available area originally provided for were rendered necessary. Altogether there are 101 stands, 81 of which have been allotted to German firms, 4 to Belgian firms, 13 to French, 2 to Swiss makers, and 1 to an Austrian concern. The exhibition is divided into seven different sections, viz.: Class A—Motor-cars and vehicles for the transport of persons.

FIG. 2.—THE KRIEGER COUPÉ.

Class B—Motor-vehicles for the transport of goods. Class C—Motor-cycles and trailers. Class D—Motors and accumulators for automobiles. Class E—Frames and wheels for motor-vehicles. Class F—Miscellaneous accessories for motor-cars, tools, etc. Class G—Motor-car literature, drawings, models, etc.

We have only space to briefly refer to the many interesting exhibits, but we hope to be able to fully describe and illustrate the principal novelties in subsequent issues. A striking feature of the exhibition is the importance of the electrical vehicle section, no less than about fourteen different firms displaying vehicles of this type. The Allgemeine Betriebs Gesellschaft für Motor-Fahrzeuge, of Cologne, show three or four vehicles built on the Krieger

(French) system, these including a victoria, a closed coupé, and a delivery van. Of these we are able to illustrate two, Fig. 1 showing the "mylord" or victoria, and Fig. 2 the coupé. The general features of these vehicles are already fairly well known, but it may be briefly mentioned that in M. Krieger's system the driving power is applied to the fore-carriage by means of an electro-motor geared to each wheel. To the armature shaft of each motor is attached a pinion with helical teeth engaging with a similar wheel rigidly attached to the corresponding driving wheel. The use of an independent motor to each driving wheel enables the steering to be effected electrically. For instance, if the armature of the motor on the inside of the curve it is desired to traverse be short circuited, the fore-carriage will turn to that side. The short circuiting is brought about by means of a special commutator arranged for this purpose. The fore-carriage turns to an angle equal to that made by the steering handle. Hand-steering gear of the usual type is also fitted to the carriage, the whole electrical apparatus constituting an electric "servo-motor" of an ingenious kind. The average speed is  $11\frac{1}{2}$  miles per hour, the maximum being  $15\frac{1}{2}$  miles per hour. It is claimed that the Krieger vehicles can cover about fifty miles of average road without it being necessary to recharge the accumulator. The battery is generally composed of 44 Fulmen elements weighing 9 cwt., and storing up a useful energy of 12 kilowatts. Six different speeds, ranging from three up to  $15\frac{1}{2}$  miles per hour, are obtainable by the manipulation of the commutator or controller. The motors and the gearing are completely enclosed in a sheet

FIG. 3.—THE OGGERSHEIM 10-TON ELECTRICAL WAGON.

iron casing. The body of the vehicles is completely separated from the frame, on which it is carried by strong springs. The conductor has two brakes: one (electric) acting on the motors in front, and the other, a band brake, on the rear axle. The motors, which are of the Postel-Vinay type, develop 3 h.p. at 2,500 revolutions per minute. The wheels are all fixed with pneumatic tires.

The Electrotechnische Fabrik und Accumulatoren Bauanstalt (Hladik, Grunewaldt & Co.), of 56 Stallscheiberstrasse, Berlin, S., show an electric victoria, very much on the lines of the Oppermann vehicles, but fitted with a battery and accumulators of the firm's own special type. A large stand is that of the Gesellschaft für Verkehrsunternehmen, 43 Unter der Linden, Berlin, N.W., the exhibits including the electrical omnibus illustrated in our issue of August 11th last, an open omnibus of the same type, two electric "droschken," and an electric delivery van capable of carrying a load of one ton.

One of the most striking features of the exhibition is the electric wagon (Fig. 3) shown by the Giesserei und Maschinenfabrik Oggersheim (Paul Schütze) of Oggersheim (Pfalz), and which has a carrying capacity of no less than ten tons. The vehicle is of the front driven and steered type, the electro-motor being geared to the front axle. The battery consists of a number of "Colonia" accumulators, having a capacity of 200 ampere-hours, or sufficient, it is stated, for a run of thirty kilometres, at an average speed of eight kilometres per hour. The controller is arranged to give a large range of forward speeds, as also a reverse motion. The vehicle, whose length is nearly twenty feet, can transport its load at speeds of from six to ten kilometres per hour, according to the road traversed, and can mount—slowly, of course—gradients of 1 in 10.

(To be continued.)

## SCOTTISH NOTES.

## A Sign of the Times.

A FRIEND of mine who is greatly interested in motors had occasion recently to drive his automobile round to the stables attached to the house of a "factor" on a large estate. He was met there by the factor's coachman, who eyed him in a very surly manner. Wishing to conciliate the man, whose looks showed he bore no great love to the horseless carriage, he asked him if he had ever seen a motor-car before. The coachman admitted he had, but declared he did not like them at all, because one had been the means of "doing him out of a job." He was formerly, he said, coachman to a doctor in Cupar Angus who kept horses and traps; but who had now gone in for a motor-tricycle which undertook the work formerly done by horses, and he had consequently dismissed his driver and sold off his horses and carriages. My friend remarked he did not appear to have been long in getting another billet, and urged him, if ever he got the opportunity, to learn motor-car driving, and so have two professions at his finger-ends.

## Lord Belhaven.

ANOTHER nobleman in the West of Scotland—to wit, Lord Belhaven and Stenton—had an automobile up at his Lanarkshire estate, Wishaw House, last week, and on the trimly-kept paths of his fine estate was experiencing all the exhilarating effects of a swift motor-car ride. The roads winding in and out the beautiful policies were of varied slopes, and no more ideal spot could have been chosen for a preliminary trial. The surface was smooth, and absolutely no vibration was felt as the car literally flew at top speed up and down the leafy avenues of trees. Whether his lordship becomes an owner of an automobile or not is a moot point, but the mere fact of the ride will cause talk in likely quarters, and such talk is usually followed by some inquiries regarding the cars. It is surprising how many noblemen appear staggered when £350 is mentioned as something like the sum required to purchase a powerful car. They immediately tell you they could buy a carriage and pair of fine horses for that sum; and so they could; but they will not see that once the initial outlay is over the difference of cost is all in favour of the motor-carriage. There are no horses in the stables to eat their heads off when they have no work to do; there is no necessity when out driving to make sure that there is stabling accommodation at the journey's end; there is no need to wash down and groom horses when returning late at night from a long drive over muddy roads; there is no harness to put away. This is only mentioning a few of the advantages of the horseless carriages.

## A Flare Up.

ON Friday evening last, in Great Western Road, Glasgow, a little excitement was caused through something of the nature of "a motor-car on fire." A car in use by a commercial traveller in the employment of one of the well-known tea companies was returning from its week's work in the country, and was proceeding at a moderate rate along the Great Western Road, when the driver was suddenly startled by a hot flame bursting up through the motor cover in front of him. Evidently some of the petrol supply pipes had snapped, and the stream of petrol was easily ignited at the burners. The driver, who was a youth with a comparatively short experience, did not open the pressure cock at once, and in consequence the front of the carriage was badly burned. On examination it was found that the petrol pipe had snapped at a brazed joint immediately under the burners, with the resultant "flare up." In experienced hands such a breakage, which is of very rare occurrence, would have been of trifling moment; the pressure cock would have been

immediately opened, and the supply of petrol cut off, and nothing damaged beyond the painting slightly smoked. It is a reasonable and always a wise thing after a lot of driving over rough roads or bad streets to carefully examine the petrol connections or a motor, as naturally the vibration is somewhat trying on joints of every kind.

## Motor-Cars on the Moors.

THE advent of the Duke of Westminster's (another convert to the horseless-carriage movement) automobile on the Scottish moors has naturally given rise to considerable talk, and "society talk" is the "breath of life" to the motor-car industry so long as it is in its favour. I recently urged the claims of the motor-car in the sporting world, and it is pleasing to see that His Grace of Westminster considers it a valuable adjunct to his sporting box. No housing or feeding of horses in sheltered position (if stables are not procurable) to consider, but simply the convenience of the sportsmen. The car may be pulled up anywhere and left to its own devices while the sporting party are intent on their "bag." I hear of several cars being requisitioned for this purpose in various parts of Scotland this season, and that a number of converts to the new method of locomotion will be made in consequence is a foregone conclusion.

"BROWN HEATHER."

## MOTOR-CAR CLUB RACES.

ON Wednesday evening the above Club held a successful race meeting at the Crystal Palace, before a small but appreciative audience. The racing was of a most exciting description, those keen racers, Messrs. Edge and Jarrott, again fighting their old battles over again, with results, after one dead heat, showing Mr. Edge the victor of the one-mile handicap and Mr. Jarrott the winner of the club championship in the English record time of 8 min. 11 3-5 sec. Mr. Wridgway was unfortunate, and could not get nearer than third in each event. Mr. F. F. Wellington was judge; Mr. Coleman, timekeeper; and the meeting was under the management of the hon. secretary of the Club, Mr. F. W. Bailey. The following were the results:—

Handicap (open).—Final heat: S. F. Edge (De Dion), scratch, 1; C. Jarrott (De Dion), scratch, 2; C. G. Wridgway, 3; J. Buck, 200 yards start, 0. In the first attempt Jarrott and Edge were quickly to the fore, and, after a hard finish, the judges decided a dead heat for first place, with Wridgway third. On running off Jarrott led from the start, but Edge, making a big effort, won an exciting race by a yard. Time, 1 min. 45 2-5 sec.

Five-mile Handicap (roadster machines).—J. Buck, 280 yards start 1; M. Moyle, 280, 2; F. Eason, 1,000, 0. Eason's machine was evidently out of order, and he retired at half-distance, Buck winning by over a lap. Time, 9 min. 41 1-5 sec.

Five-mile Race (for the Championship of the Motor-Car Club).—C. Jarrott, 1; S. F. Edge, 2; C. G. Wridgway, 3. Jarrott led for the first mile, when Edge went in front, and maintained premier position up to fifty yards from the finish, where Jarrott got the best of the final struggle and won by a few inches; there was a big gap between second and third. Time, 8 min. 11 3-5 sec.

Two-mile Handicap (open).—Final heat: M. Moyle, 1,050 yards start, 1; C. Jarrott, scratch, 2; C. G. Wridgway, scratch, 3; V. Lee, 1,050, 4. Lee was well ahead two laps from the finish when something went wrong with his machine, and Moyle, having a good start, won comfortably by thirty yards; fifty yards between second and third. Time, 3 min. 21 3-5 sec.

After the racing was over a number of members and friends sat down to dinner in one of the new rooms overlooking the illuminated gardens. Mr. C. Cordingley was in the chair, and among those present were Mr. H. J. Lawson, Mr. and Mrs. Edge, Mr. and Mrs. Wridgway, Messrs. Bartleet, Napier, Munn, J. H. Smith, Wotton, F. W. Bailey, etc. A pleasant evening was spent, the toast list being commendably short, the principal one being "Success to the Motor-Car Club." Judging from the response by Messrs. Lawson and Bailey, it appears that the club is in a flourishing condition, and its programme for the future is a most ambitious one and if carried out will help to make the Club of such value that every motor-vehicle owner will desire to co-operate.

A COMPANY has just been formed in Paris (46 Rue de Provence), with a capital of £40,000, to be known as La Compagnie des Transports par Automobiles au Soudan Français.

## THE BLACKPOOL MOTOR-CAR COMPANY.

In the action of *Hamilton v. the Blackpool Motor-Car Company, Limited*, an application was made on Wednesday, in the Vacation Court, for the appointment of a receiver. Mr. Macnaghten appeared for the plaintiff, a warehouseman, of Leeds; and Mr. Story Deans opposed. The case arose out of a guarantee to the bankers given by the plaintiff, but the security was not actually given at the time—that is, in August, 1897. Shortly after the resolution for voluntary liquidation was passed the security was given. Mr. Story Deans said that the liquidator really only wanted advice as to when he should pay over the balance under the director's guarantee. He had been advised that it would be a preference. He did not object to being put on terms of keeping an account. There was £520 in hand—plenty to pay. Mr. Macnaghten agreed that the total required was only some £300, and the whole of this sum he was entitled to charge against the liquidator. He wanted to secure that the cash should be free from unsecured creditors, who had only to issue execution to the Sheriff and they could get the money. He did not wish that they should have the power to dispute his security. Mr. Justice Cozens-Hardy suggested that the money should be paid into court; that would be the least expensive course. Mr. Story Deans agreed to this, and the money was ordered to be paid into court within seven days.

## THE SALE OF MOTOR-CARS.

In the City of London Court on Wednesday, Mr. George W. Rice, cycle manufacturer, Surbiton, sued Friswell, Limited, Holborn Viaduct and New Bridge Street, E.C., to recover £49 10s. in reference to a motor-car. The plaintiff bought a Benz Ideal motor-car from the defendants, and paid £153 for it, intending to let it out on hire for £3 10s. a week. After he had had it for a month one of the tires bulged, and rendered the car useless. The plaintiff now wanted the defendants to pay £7 10s. for a new tire and £3 10s. a week for twelve weeks for the loss of hire money. The defence was that the car could not have had fair wear and tear; but the defendants' counsel first took a legal objection that the plaintiff could not recover because, under the Sale of Goods Act, there was no implied warranty in respect of patent goods or those having a trade mark description such as the car in question. Mr. Kays, plaintiff's counsel, contended that the goods must be of merchantable quality, which they were not. Mr. Commissioner Kerr said the plaintiff could not recover. He had had inspection of the car, and the law gave him no remedy, even if he had a grievance. The plaintiff must pay the costs of the litigation.

## THE HACKNEY VESTRY AND MOTOR-CARS.

At a meeting of the Hackney Vestry on Wednesday evening, Mr. G. Yarrow Baldock moved as follows:—"That, in consideration of the large and continually increasing amounts paid by the Vestry for horse hire and cartage, and with a view to facilitate the work of 'slopping and dusting' being undertaken entirely by the Vestry without the intervention of a contractor, it be referred to the General Purposes Committee and to the Public Health Committee jointly to report as early as may be—(a) As to the practicability and possible economy of employing for the purposes of the Vestry carts and vans driven by electrical or other automatic motors. (b) As to the advisability of fitting suitable motors to the water carts and other vehicles—all or any—at present the property of the Vestry. (c) As to the advisability of the purchase by the Vestry, for experimental purposes, of a motor-van or vans of the most approved pattern designed, for the collection of refuse and scavenging, either or both. And, further, that the said Joint Committee be and is hereby authorised to obtain all such necessary estimates, plans, drawings, and specifications as will enable the fullest possible information (specially as to probable capital outlay and cost of maintenance) being embodied in the report for the guidance of the Vestry."

In moving this Mr. Baldock said it had been admitted at a previous meeting that for a comparatively small sum they could have motors fitted to run the water carts, provided that there were the proper works in existence to supply the necessary electric power. Other municipalities throughout the country had adopted motors with marked success, and it was to be hoped that Hackney would not be behind the age in this respect. It was at least their duty to see if they could save money. They would in due course have their works for supplying electric light, and during the day the plant could be used for generating the necessary power for the motors.

Mr. Denham seconded the motion, because he had great sympathy with the general idea and believed that in a few years a good deal of work would be done by motors very cheaply and expeditiously.

Finally, Mr. Baldock accepted a suggestion made by Mr. Grant to refer the question to a joint committee consisting of four members from each of the following committees: General Purposes, Public Health, and Electric Lighting; the same to report to the Vestry on the subject.

## EXCESSIVE SPEED OF A MOTOR-CAR.

MR. BERTIE MILLER was summoned at Yarmouth last week for driving his motor-car at improper speed. Sergeant Mason said that on Sunday afternoon defendant left the Britannia Pier at 4.9 p.m.; he passed the Wellington at 4.12, went beyond the barrack wall, returned to the

Wellington Pier at 4.17, and was back to the Britannia Pier at 4.20 p.m., which would give a speed of over thirteen miles per hour. Defendant denied that he travelled at that speed, and said he could not go from pier to pier in three minutes. The Chief Constable said he was on the Wellington Pier and saw defendant pass at a furious rate. Police-Constable Fish said he and Sergeant Mason were on the Wellington Pier, and while he looked through a pair of glasses Mason took the time. Police-Constable Brown said he was at the foot of the Britannia Pier, and saw defendant start at 4.9 p.m. He ran on to the Britannia Pier and saw defendant pass the Wellington Pier. There was a great many people about, and defendant returned in eleven minutes. Defendant said it was no use calling witnesses, but he denied that he could do the journey in eleven minutes. He was fined 40s. and costs, or one month.

## THE ALTRINCHAM MOTOR-CAR ACCIDENT.

A COUPLE of months ago George Barnes, employed by Messrs. Bond and Co., soap manufacturers, Salford, was summoned for furiously driving a motor-car at Altrincham. Owing to his having met with serious injuries the hearing of the summons was adjourned. Superintendent O'Kell, at the Altrincham Petty Sessions on Monday, asked that the summons might be withdrawn, as the man was still under medical treatment. The application was allowed.

## FURIOUSLY DRIVING A MOTOR-CAR.

At Eastbourne, last week, Mr. Percy Brennan was charged with furiously driving a motor-car in Cavendish-place on September 6th. George Stockman stated that at noon on the day in question, he saw the defendant coming with the car over the Cavendish Place Bridge. He was travelling at the rate of twenty miles an hour. He himself owned a motor-car, and therefore understood them. The defendant could not have stopped the car in 100 yards. Defendant asserted that he could have pulled up in two yards. Mr. Stockman observed that defendant travelled 150 yards before he could pull up. David Hollands corroborated. Defendant denied the possibility of his having travelled at a rate of twenty miles an hour. A fine of 10s. and costs was, however, imposed.

## TO CORRESPONDENTS.

All communications intended for insertion in this Journal or relating to Editorial matters should be addressed to THE EDITORIAL DEPARTMENT, MOTOR-CAR JOURNAL, 39 and 40 Shoe Lane, London, E.C. Letters must in all cases be accompanied by the name and address of the writer, as no notice will be taken of anonymous communications.

The Editors cannot undertake to return MSS. or drawings, although every effort will be made to do so in the case of rejected communications. Where such are regarded as of value, correspondents are requested to retain copies.

The Editors do not hold themselves responsible for the opinions expressed by their correspondents, or for statements and facts which do not appear in the editorial columns.

The Editors and Publishers beg also to state that they will accept no responsibility for unsolicited contributions, even if used, unless payment for same is directly specified in forwarding, and the terms arranged before publication.

To insure insertion communications and contributions must be in the Editors' hands by Wednesday forenoon of the week in which the same are intended to appear. Disappointment may be caused by non-compliance with this rule, and to avoid this earlier receipt, if possible, is necessary.

## SALES, WANTS, Etc.

[All Advertisements under this heading will be inserted at the minimum rate of 1s. 6d. for 18 words and thereafter at the rate of 1d. per word per insertion, but on no account will any Advertisement be inserted unless prepaid.]

TRICYCLE FOR SALE at a low figure. Practically new and latest pattern; genuine De Dion throughout; with all accessories; can be seen in London.—Box 72, *Motor-Car Journal*, 39-40 Shoe Lane, London, E.C.

TWO MOTOR DELIVERY VANS, in good condition; can be altered into wagonettes; one £70 and one £125.—Apply Frank F. Wellington, 36 St. George's Square, Regent's Park, N.W.

MOTOR-QUADRICYCLE, interchangeable to tricycle, by De Dion and Bouton, very little used, exceptional bargain, in grand running order; price £67 10s.—Apply Frank F. Wellington, 36 St. George's Square, Regent's Park, N.W.

DAIMLER MOTOR-WAGONETTE, 5½ h.p., grand carriage, in perfect condition, new tires, repainted and upholstered, to carry four or six, free trial to buyers; price £265.—Apply Frank F. Wellington, 36 St. George's Square, Regent's Park, N.W.

DAIMLER MOTOR-WAGONETTE, 5½ h.p., to carry eight passengers besides driver; geared low for hill climbing, suitable for passenger service, in perfect running order, hardly been used; price £265.—Apply Frank F. Wellington, 36 St. George's Square, Regent's Park, N.W.

BENZ INTERNATIONAL, to carry three; beautifully upholstered, very powerful, all latest improvements, in grand order; price £120.—Apply Frank F. Wellington, 36 St. George's Square, Regent's Park, N.W.

DE DION TRICYCLES (two).—1½ h.p.; electric ignition; in first-class order; £35. Also Werner Bicycle, in running order, £20.—Apply Frank F. Wellington, 36 St. George's Square, Regent's Park, N.W.

MORS CAR to be Sold.—Very fast; splendid condition; 8 h.p.; to carry eight persons.—Apply Frank F. Wellington, 36 St. George's Square, Regent's Park, N.W.

WELLINGTON'S "MOTOR-CAR REGISTER AND ADVERTISER" posted free to any address; send post card for copy to Frank F. Wellington, Proprietor, 36 St. George's Square, Regent's Park, N.W.

WANTED.—Good second-hand Trailer, to suit De Dion Tricycle.—Full particulars to Aalbrecht & Co., Ramsgate.

NEW GENUINE MOTOR-TRICYCLE by De Dion & Bouton; latest 1½ h.p., guaranteed perfect order; can be seen any day.—Paris Singer, 165 Manor Street, Clapham, S.W.

COVENTRY MOTETTE for Sale, in splendid working order. New 3½ cylinder. What offers?—Grose, Limited, Northampton.

FOR HIRE.—Daimler Wagonette; seats seven (besides driver); by day, week, etc.; or as delivery van.—For particulars apply to Frank Sheppard, 122 Merton Road, Wandsworth, S.W.

SECOND-HAND BENZ CARS for Sale from £100 upwards; great reductions.—Speedwell Co., 83 Oxford Street, Reading.

BENZ IDEAL CAR for Sale; 3 h.p.; in thorough going order; going in for larger car.—Free trial at 12 The Avenue, West Ealing, Middlesex.

PANHARD-LEVIASSOR PHÆTON for Sale; property of a gentleman. Latest improvements; very pretty carriage; perfect condition. £400.—Address, B. B., c/o Goss, 460 Oxford Street.

WANTED.—Second-hand Motor-Tricycle or Voiturette, good condition, but cheap. No. 66, *Motor-Car Journal*, 39-40 Shoe Lane, London, E.C.

CAPABLE MECHANIC, 28 (abstainer), wants Berth in Motor trade; would drive; low wages to commence.—Address, Chesterfield, *Motor-Car Journal* Office, 39-40 Shoe Lane, London, E.C.

BACK NUMBERS "MOTOR-CAR JOURNAL."—Numbers 1 and 4 are out of print. Of other back numbers we have but a few left. Those desirous of completing their files should make immediate application for missing copies. Usual price, 1d.; post free 1½d. or through any news-agent.—Cordingley & Co., Proprietors, 39-40 Shoe Lane, E.C.

GIBBONS BROS. have been appointed Representatives of the Butler Motor Co., of Paris, and the new model 2½-h.p. Motor Tricycle can be seen at the Dover Show.—Note address: Gibbons Bros., Belmont, Surrey.

GIBBONS BROS. beg to inform you that the Butler Tricycle will pull a trailer with two people in it at 20 to 25 miles an hour. See it at the Dover Show and try for yourselves.—Gibbons Bros., Belmont, Surrey.

BUTLER TRICYCLES can be had with detachable front seat, with two extra wheels to convert into Quadricycle; also Quadricycle not convertible. Plenty of power, reasonable in price.—See samples at Gibbons Bros., Belmont, Surrey.

LOOK OUT for the Butler Motors, enamelled in black and red, at the Dover Show.—Gibbons Bros., Belmont, Surrey.

TO AGENTS.—Write to GIBBONS BROS. for quotations for Butler Tricycles, and immediately you will want our agency. Our Tricycles only want to be shown, you will then find that they sell themselves.

GIBBONS BROS. supply two-speed gears, to fit to other makers' Tricycles that haven't much power in them. You don't want them with a Butler.

DO YOU WANT TO BUILD YOUR OWN TRICYCLES? Because we supply component parts. Everything complete except tires and rims. All you have to do is to build frame and wheels, fit on motor and accessories and your own transfer.—Gibbons Bros., Belmont, Surrey.

GIBBONS BROS. are also representing Mr. J. BURNS, of Berners Street, W., and will stock a full line of their very highest grade Electrical Equipments for Tricycles and Cars.

GIBBONS BROS. supply Reserve Spirit Tanks, with separate compartment for lubricating oil, complete with tubes to carburettor and crank chamber; Dry Batteries, Accumulators, Volt-meters, Ampère-meters, Coils, and Sparking Plugs.

ARE YOU A GREAT DISTANCE FROM LONDON? Because we will endeavour to call on you, or send you name of nearest agent.—Gibbons Bros., Belmont, Surrey.

MR. W. J. GIBBONS, of GIBBONS BROS., will be calling at all towns on the South Coast on his BUTLER Tricycle pulling a trailer, and showing complete set of Motor-Tricycle Components, commencing directly after the Dover Show. Write and ask him to call on you.

GIBBONS BROS.' preliminary Catalogue is now out. Write for it and if you don't see what you want, let us know, and we will quote by return.

PARTNERSHIP.—Practical Engineer, having designed and made improved Motor-Tricycle, which can be sold at large profit, desires to meet with Partner or Capitalist with not less than £1,500 to start manufacturing; or would arrange with firm to manufacture on royalty. Machine well reviewed; several orders and inquiries. Good opportunity of forming Syndicate.—For appointment, write Box 31, J. E. May, Advertisement Agent, 68 Fleet Street.

## Trade Announcements.

[All Advertisements under this heading will be inserted at the minimum rate of 2s. 6d. for 30 words and thereafter at the rate of 1d. per word per insertion, but on no account will any Advertisement be inserted unless prepaid.]

PLATINUM.—Used Ignition Tubes Wanted, and Platinum Scrap of all kinds Purchased; best prices by Derby & Co., 44 Clerkenwell Road, London, E.C. Established 1797. 24

NORTH OF ENGLAND AGENTS for Phébus-Aster Motors, best Motor Accessories, Horns, Toolbags, Ignition Plugs, Valves, Piston Rings, etc. Repairs thoroughly done.—J. A. Bennett & Co., 3 Exchange Arcade, St. Mary's Gate, Manchester.

HIRE-PURCHASE OF CARS.—The Midland Motor Agency, Acocks Green, Birmingham, can supply Motor-Cars and Cycles of any description, for cash, or on easy terms arranged to suit individual customers.

"THE MOTOR-CAR MANUAL," by R. Moffat Ford, deals with every type of oil motor in a plain and simple manner, for lay readers. How to buy a motor-car, and how to treat it when bought. Why is a motor when it stops? How to make an excursion, and so forth. Treats fully of Daimler, De Dion, Benz, Bollée, Panhard, Mors, Peugeot, and other motors. Post free in exchange for Postal Order value 2s. 6d.—The Motor-Car Co., 168 Shaftesbury Avenue, London, W.C. 26-39

# THE Motor-Car Journal.

Vol. I.]

LONDON, FRIDAY, SEPTEMBER 22nd, 1899.

Published Weekly by CORDINGLEY & CO., 39 & 40 Shoe Lane, London, E.C.

## COMMENTS.

LAST week's *Spectator* contained an article on "The Resurrection of the Road" which must be welcome as one of the most sensible and suggestive utterances on the subject of automobilism that have lately appeared in English journals. Recognising that "carriages can be built which will travel along the roads with safety

and comfort, and carrying heavy loads," the *Spectator* sees "that the rise of the motor-car must restore the use of the roads." Till now very little general interest has been taken in the roadways of this country, and the advent of cycling, while it necessitated some improvements on the surface, had no effect upon the widening and straightening of some of the main thoroughfares. The improvement of the road simultaneously with the development of automobilism will restore the prosperity of many an old village inn; while the adoption of motor-vehicles for the marketing of produce should lead to increased prosperity among small agriculturists. Around London, too, there is need for great reform. Almost all the high roads out of the Metropolis run through a narrow neck perpetually blocked by traffic. Our contemporary instances Hammersmith Broadway, into which the Hammersmith Road, the Hounslow Road and other great thoroughfares converge. Mention might also be made of the narrow streets leading from Aldgate into the City, through which pours the traffic from several districts of Eastern London. If automobiles become popular with the people these narrow streets will have to be widened, for it is not wholly visionary to think of the time when the dwellers in particular streets will be taken to town in one motor-vehicle calling for its passengers at successive houses.

### Doctors and Automobiles.

WISER than the *British Medical Journal*, many doctors have ordered their automobiles before reading the advice of that journal in its last issue "to wait for further developments."

Our contemporary recognises the advantages of mechanical locomotion on ordinary roads, and realises how strongly its merits should appeal to medical men; but "it must be remembered that they have a fatal facility for breaking down at the wrong or most critical moment," while "a motor-car, we are quite sure, would not be looked on with much favour in a hunting country, where a large proportion of better-class patients would be sporting people, who would certainly look askance on any one who did not pay due reverence to the fetish of horseflesh." To the latter point, the fact that many sporting men and lovers of horses are most enthusiastic automobilists should be sufficient answer; and as to breaking down at the wrong time, does not that happen to 99 per cent. of the doctors' patients, and even in the case of horses—let alone the mechanical, unthinking motor-car? But we will not be hard upon the

*British Medical Journal*, for it furnishes some excellent reasons why doctors should find the motor-car a boon.

### Horse v. Motor-car.

"IN many country practices," says our medical contemporary, "a doctor is obliged to keep three or four horses at least, besides traps, and this is a constant drain on his income, whereas one motor-car will suffice for all his work, is always ready at a moment's notice, and costs next to nothing to keep. Take the case of a doctor in the country with a large and scattered practice: four to six horses, a couple of men, stabling, shoeing, forage, wages, repairs, vets' bills, etc., will cost him at least £300 a year. A motor-car, on the other hand, after the first initial expense (they vary in price from 150 to 300 guineas) only requires the services of a lad to keep it clean, and it will cost considerably under £100 a year, including wages, repairs, and the fuel or motor power required. All country practitioners have experienced the worry of an urgent night call and the time wasted before the trap makes its appearance at the door. With a motor-car the doctor goes direct to the stable, or wherever he keeps his conveyance, no assistance is required, he applies a light or turns a lever as the case may be, sets the machinery in motion, and within a very few minutes of his first receiving the summons is off on his journey at full speed."

### Motor-Cars Wanted in Brighton.

A WRITER in the *Brighton Guardian* tells, with great satisfaction, his experience of the motor-car service at Newcastle-on-Tyne, and wonders why Brighton is so laggard in this respect. It appears the local authorities have "repeatedly laid it down that a 'satisfactory' motor-car could not be got in the town"—a statement that seems to lack either a want of enterprise or of observation. At such a place as Brighton a motor-car service should be as important a feature as bathing machines.

### Extensions Wanted.

ALTHOUGH it was imagined in some quarters that the difficulty in connection with motor-car services would be the lack of passengers, that has not proved to be the case. In fact, experience has shown the reverse to be true, and already grumblers have appeared who complain of the caterers for public conveyance by motor-car because they do not extend their system at once. At Sunderland, for instance, the local motor-car company has been told that "there are plenty of routes open to them which they have not yet exploited." So popular is the new system of getting to town that those who cannot avail themselves of it are envious of those who can.

### A Southport- Built Motor-Car.

WE learn from a correspondent that a new light motor-car is in course of construction at the works of Mr. Oliverson's, Queen's Road, Southport. The vehicle will be provided with a petroleum-spirit motor with water-jacket and electrical ignition. A new variable-speed gear is

being adopted, the latter being Mr. Oliverson's own design. The car is constructed to carry two persons, and weighs under 7 cwt. It is fitted with ball bearings throughout, not only in respect to the wheels, but also in regard to the shafting, and a feature of the car is the fact that it is supplied with a special water-cooler, which enables the car to travel 200 miles without changing the water.

#### Another Parliamentary Automobilist.

THE Hon. A. J. Balfour, M.P., has been displaying a keen interest in the motor-car. While staying at Whittinghame recently he was seen out driving on several occasions in an automobile in various parts of East Lothian. When at North Berwick also, whither his love of golf had drawn him, as likewise a host of other political and social celebrities, he engaged in animated conversation with the driver of one of the Edinburgh Autocar Co.'s vehicles, and asked a great many very pertinent questions regarding the automobile. We wonder if he will be the next M.P. to possess a motor-car.

#### Automobiles for Municipal Work.

APART from the increasing popularity of motor-vehicles from a sporting point of view, the advantages of self-propelled vehicles are already receiving the attention of municipal bodies in various parts of the country. Only last week we dealt with the discussion which took place at a meeting of the Hackney Vestry regarding the employment "for the purpose of the Vestry carts and vans driven by electrical or other automatic motors." The Chiswick Vestry led the way in this country in the adoption of motor-vehicles for the removal of dust from houses, and also for the removal of road scrapings. The vehicles first started about two years ago, and, as stated by Mr. J. I. Thornycroft in the course of his paper at the British Association this week, they have since been in continuous daily service. In connection with this matter it is interesting to note that at the recent Congress of the Cleansing Superintendents of Great Britain, at Glasgow, a resolution was unanimously passed to the effect that "in view of the great improvement recently demonstrated by the trials held at Liverpool and elsewhere, this meeting of the Cleansing Superintendents of Great Britain recommend that all municipal, urban, and other authorities shall encourage the introduction of motor-vehicles for street cleansing operations."

#### At the British Association.

ONE of the papers read before the Mechanical Section of the British Association was by Mr. J. I. Thornycroft, F.R.S., on "Recent Experiences with Steam on Common Roads." As we propose to publish this paper in the *Journal* there is little necessity for detailed comment, save to congratulate Mr. Thornycroft on provoking a very useful and animated discussion. Sir Frederick Bramwell referred to the earlier inventors and said he thought that of the various methods of propulsion now being tried steam would survive the competition. Mr. W. W. Beaumont advocated that automobilists should have the same reasonable liberty of judgment as drivers of horse-drawn vehicles in regard to speed and weight, and pointed to the necessity of legislation regulating the width of tires by the total load carried. In reply to this, Sir Alexander Binnie, engineer to the L.C.C., pointed out that though the London streets would stand very heavy loads the bridges and culverts on country roads were often not capable of carrying excessive weights. During the further discussion it was asked whether it was practicable to fit road motor-vehicles with rubber tires. Mr. Thornycroft, in the course of his reply, admitted that rubber tires were very desirable, but the present cost of rubber precluded their use for heavy vehicles. Iron or steel tires might suffice for goods vehicles going at a moderate speed; for passengers' conveyance or fast motors rubber tires were very desirable.

#### Motor-Cars in the German Army.

IN our last issue reference was made to the fact that a number of motor-cars and cycles had figured in the recent German military manœuvres. According to the daily papers the military authorities studying this question are fully convinced that the introduction of motor-vehicles will do much to revolutionise the transport and train services. During the manœuvres eight vehicles of various types were, it is reported, subjected to most trying experiments both in day and night service. Although the weather was bad and the roads deeply rutted, the machines worked perfectly. They were chiefly employed in postal service and for carrying packages. It is said that the Kaiser takes the greatest interest in this new development. A number of officers are to be set apart to study motor-vehicles and impart instruction to their subordinates. It is to be trusted that our military authorities will be induced to reconsider their recent decision not to permit experiments of motor-vehicles as an adjunct to the military equipment of the British army.

#### Ladies and the Automobile Club.

Do Mr. W. T. Stead and his young ladies want to run the universe? We all know how the enterprising journalist has run agitation after agitation these last few years, booming many good and useful things in his own inimitable style. But why his "sanctum" should be made the place of meeting for the ladies who motor we know not. And yet Miss N. G. Bacon writes to the *Daily Chronicle* to declare that "As ladies are not permitted to become members of the Automobile Club of Great Britain, the formation of a 'Mowbray House Automobile Club' has been suggested, and a meeting will be held in Mr. Stead's sanctum at an early date to discuss the matter. An invitation to attend the preliminary meeting will be forwarded to all ladies interested in motors and motoring on receipt of stamped addressed envelope." And then, after quoting the rules of the Automobile Club as to ladies, she asserts: "Surely the time has come for ladies in this as in other matters to act for themselves." All the valiant men motorists will quake and quiver at the thought of the organized band of lady motorists meeting in the sanctum of Mr. Stead to concoct some plan of campaign against the presumption of the Automobile Club in only permitting ladies on its premises from 3 to 6 p.m. What will they do? Perhaps attempt to effect an entrance during the mysterious hour of dinner, in which case we suggest that the steward should be provided with a "hooter." It would scare them, and perhaps prevent a second endeavour of the ladies to be obtrusive.

#### Partinium—a New Aluminium Alloy.

SOME weeks ago we referred to the fact that Messrs. De Dion & Bouton, of Puteaux, France, are having built in Paris a new "body" for a twenty-four seated steam omnibus entirely constructed of "partinium." In giving publicity to the same paragraph, a contemporary in its last issue raises the query: "Should not this be platinum?"—being apparently unaware of the fact that partinium is used very largely by motor-car builders in France in place of aluminium, it being very much cheaper than this metal, is nearly as light, and possesses greater resistive qualities. Partinium is, as a matter of fact, an alloy of aluminium and tungsten, the percentage of each being varied as desired. Cast partinium has a specific gravity of 2.89; in the rolled form it is 3.09, the elongation varying from 6 to 8 per cent, while its tractive resistance is given as 32 to 37 kilogrammes per square millimetre. It is interesting to note that the "body" of M. Jenatzy's well-known record-breaking car "La Jamais Contente" is constructed of the new alloy, which is being employed for a variety of other purposes by automobile builders on the Continent. Messrs. De Dion & Bouton

are using it to a large extent both for the oil-containing crank case in their tricycle-motors and for gear cases in their large steam vehicles. It is satisfactory to note that the advantages of the new alloy are receiving the attention of motor-car builders in this country; indeed, it was the head of a large English automobile firm which drew our attention to the query raised in our contemporary.

#### Motor-Cars on Tees-side.

WE referred in our issue of the 1st inst. to the proposals of a new concern—the North York and South Durham Motor-Car and Bungalow Syndicate—to start a series of motor-car services in that district. The company has, we learn, already got to work. For the last fortnight a service of cars to hold twelve persons has been running between Middlesborough and Redcar, the journey each way taking about twenty-five minutes, and the fare being less than that charged by the railway company. It is anticipated that a complete service will be organized by next season.

#### The Automobile Situation.

UNDER this comprehensive title Mr. Hiram Percy Maxim contributes an article to the current number of *Cassier's Magazine* which looks at the matter through American spectacles, although it is plentifully illustrated with French and English as well as Yankee cars. "It is possible to buy to-day in America," says Mr. Maxim, "an electric carriage which will carry either two or four passengers a distance of thirty miles, over ordinary grades, at an average speed of eleven miles an hour, on one charge of its storage battery." Not only in America but also in Europe can this be done. However well acquainted with American automobiles the writer may be, he is clearly not quite up to date with regard to those of other countries, for the firm of Panhard-Levassor is referred to as Perin, Panhard & Co., its old designation, and last year's steam wagon of the Steam Carriage and Wagon Co., Ltd., is illustrated as a type of the present "situation."

#### The Royal Institute of Public Health and its Motor-Car Exhibition.

WE regret to learn that the efforts of the officials connected with the Congress of the Royal Institute of Public Health to organize a motor-car exhibition in connection therewith have met with very little success, the only vehicle putting in an appearance at Blackpool at the opening of the congress yesterday (Thursday) being a Coulthard steam wagon, fitted with a tipping body for dust and refuse removal purposes. When the announcement of the exhibition was first made we expressed our doubts as to its value from a business point of view, which doubts have apparently been shared by the various motor-car building concerns in this country.

#### Motor-cars in the Isle of Man.

WE recently referred to the arrival of a motor-chairs-a-banc at Douglas. During the past few weeks the car has run trips morning and afternoon from Douglas, carrying full loads every journey to Peel or Glen Helen for the popular 2s. 6d., return fare. The car so far has, we are glad to learn, given every satisfaction. Its reception, from all accounts, by the car proprietors on the front has not been altogether favourable, and a report that the passengers had to get out and push the car up the hills possibly emanated from that quarter. We need hardly say the report was absolutely groundless, as the car has taken all the hills in capital style, and when it comes to a bit of level road or down hill horses are quickly left behind. If all landaus and traps on the front could be run without horses it would, remarks the *Isle of Man Times*, very much improve the promenade from a sanitary point of view; and the time may now, perhaps, be said to be within a measurable distance when this change will be effected.

#### A Motor Fire Engine.

WE have for some time been looking for the introduction of a motor fire engine by some enterprising British concern. The blank has now been filled by Messrs. Merryweather & Sons, of Greenwich, who have just completed a self-propelled steam fire engine. The vehicle, which is intended for use in India, resembles in general appearance an ordinary fire engine; it is, however, fitted with an arrangement of spur gearing which enables the engine to drive an intermediate shaft when put out of gear with the fire pumps. This countershaft is fitted with balance gear, and drives the rear wheels by means of strong pitch chains. The steering is effected by means of a hand wheel actuating a vertical shaft which is connected to the fore carriage, a small sprocket wheel and roller chain being provided for this purpose. The pumps are capable of delivering 300 gallons per minute, and of throwing a jet to a height of 150 feet. When the fire engine was tested in London it was found that such hills as Blackheath could be mounted at a speed of ten miles per hour, while upon the comparatively level roads over Blackheath to Shooter's Hill a speed of from fifteen to twenty miles per hour could be easily maintained. The steering wheel, steam regulating lever, reversing lever, and brake are all within easy reach of the driver sitting on the off side on the front, and an auxiliary brake is provided to work with a

MR. DAN ALBONE ON HIS MOTOR-CAR AT SUTTON, AN OLD PICTURESQUE VILLAGE NEAR BIGGLESWADE.

screw and hand wheel at the back. The machine is arranged to carry the usual complements of firemen, hose and gear, and the entire weight when fully equipped with fuel, coal, water, and the firemen is under three tons. The boiler is of the same pattern as that used in the construction of the engines supplied by this firm for the Metropolitan Fire Brigade. Steam can be raised from cold water to working pressure in six minutes from time of applying the match to the fire; but if a heater with self-locking couplings and automatic disconnection is fitted in the engine house, steam can be raised in so short a time that the engine can start at full speed from the fire station in from three to four minutes from time of receiving the call. When the scene of conflagration has been reached the fire pumps can be at once thrown into gear. In connection with this question of automobile fire engines, we may mention that, at the instigation of the Leicester fire brigade authorities, the Daimler Motor Co. has undertaken to turn out a fire service wagon which will be ready to start on its journey within thirty-two seconds from the time of call. Other fire brigade authorities will watch the Leicester experiment with considerable interest.

MESSRS. KESTERTON'S, LTD., the well-known coach-builders of Long Acre, W.C., have taken up an agency for the sale of the "Marshall-Hurtu" car, and will always have one in stock to show customers.

## THE "INSEPARABLE" THREE-SEATED MOTOR-TRICYCLE.

AN outcome of the increasing popularity of motor-cycles and motor-cycling in France is the "Inseparable" two or three-seated motor-tricycle made by M. P. Dorrigny, of 28 Rue Leseur, Paris, and illustrated herewith. The frame of the machine consists practically of two ordinary safety bicycles coupled together, the two front wheels being cut away and replaced by a single front wheel, which acts as the steerer, the frame being strongly braced with tubing. In reality, the machine is a tricycle, with a differential driving axle placed at back and fitted with a  $2\frac{1}{4}$ -h.p. De Dion motor. The feature of the machine is that the frame each side is made on the lady bicycle style, this being done (1) in order to facilitate dismounting, (2) so that a lady can mount in ordinary bicycle costume without looking unsightly in the least.

The two saddles are located directly above the rear wheels, while a small seat can be fitted in the centre of the two riders, as shown in the illustration, to seat a child in perfect safety, or for the conveyance of luggage.

The manipulation for the mixture of gas, carburation, etc., is exactly on the same principle as the "De Dion" tricycle, the levers being arranged so that they are controlled by the person sitting on the right. Two powerful band brakes are fitted, acting upon the differential gear and back driving axle, but one alone is claimed to be sufficient to pull the machine up in two yards. The speed obtained on the level is about eighteen miles per hour. On moderate hills pedalling is said to be absolutely unnecessary, but on very steep grades both riders can assist the machine by gentle pedalling. The machine is not intended for racing purposes and is therefore not geared up high; it is described as being a vehicle for family use, for short, quiet spins and excursions. The width of the machine is about 3 ft.

Our contemporary, *Industries and Iron*, which devotes space every week to motor-car matters, has been reduced in price, while all its interesting features have been retained. It is now published at 4d.; annual subscription, 15s.

## JOTTINGS BY A WORLDLING.

As I was driving near Richmond the other day a hen rushed from the side of the road in among the wheels of my quadricycle. Result: death of the bird and yells from the occupant of my front seat. I stopped, and an ignoble varlet came out of a neighbouring house and said concisely, "That hen was

worth half a crown," without the usual accompaniment of blasphemy. This so astonished me that I paid him without a murmur. But should I have done so? People have no right to allow fowls suffering from homicidal mania to wander on the Queen's highways without a guardian.

BUT, to be more serious, the hen is rather dangerous to the tricycle or light voiturette, as it is a stupid creature that rushes any way when frightened, as soon into the object it fears as away from it. And a hen in among one's wheels and mechanism is most undesirable. I had a curious experience of this nature in the spring between Castellane and Digne. We were going at full pace round one of the spiral roads which wind up and down the Alps, when suddenly an old ram who was standing by the way side *butted* at us and tried to toss 500 kilogrammes of motor-car over the precipice—happily without success. The wheels broke its spine, but the shock threw us on to a heap of flints, and "pop!" went one of the back tires. My "bag" is now one dog, one ram, one duck, two lizards, one hen, and the tail feathers of a pigeon that I dragged from its owner as it "got up" by my side one day on the Corniche Road—"un de ces pauvres pigeons qui fréquentent Monte Carlo."

I WISH I had been able to go on the Automobile Club's trip to Folkestone. I should have liked to see the show at Dover, and the trip across the Channel, for the arrival of the Paris-Boulogne race must have been most interesting. I wonder if it occurred to any body to go out to Pont de Briques, the crucial point of the run from the hill-climbing point of view. There is a stupendous rise there with an ideal down run into the town, past "Johnny" Pourre's pen factory.

MR. NORMAN SINCLAIR is one of the latest proselytes to the creed of automobilism. He tells me that the roads in his county—Caithness-shire—are perfect for motoring. His brother's (Sir John) house is only fifteen miles from John o' Groats.

THE United States Motor-Vehicle Co. has been incorporated under New Jersey laws with £300,000 capital, and has purchased valuable patents on both gasoline and electric systems. The Company will manufacture electric and hydro-carbon vehicles of new design for both pleasure and business purposes. They have purchased T. W. McCullough's petroleum-spirit motor and motor-vehicle patents (Back Bay Cycle and Motor Co., Boston, Mass.), Harry E. Dey's electric system and others.

THE Anglo-American Oil Company, Ltd., of 22 Billiter Street, London, E.C., send us a copy of their new pamphlet relating to Pratt's motor-car spirit now so largely used by automobilists. The list of agents stocking spirit has been revised and enlarged, it now extending to eight pages. The Company are about to issue a useful small waistcoat pocket list of agents all over the country stocking Pratt's motor-car spirit. We are glad to learn from the Company that their improved system of spirit distribution in cases of one or two-gallon cans has been most favourably received by the owners of motor-cars.

# The Paris-Boulogne Race.

(From Our Own Correspondent).

CONTESTED on Sunday last over a route of 230 kilometres, this race, as compared with some of its predecessors, was patronised by comparatively few racing men, and it is evident that many automobilists consider they have competed in sufficient *courses* for this season, and intend to take a rest. The category for two-seated motor-cycles received a fair number of entries (forty-three), and no less than thirty-four competitors presented themselves at the starting *contrôle*, situated in the route des Loges at Saint-Germain. They were duly despatched at 8.40 a.m. Twenty minutes later the twelve competing

cycle at 2.3 p.m. He was followed by M. Girardot, on a Panhard car, at 2.17. This car arrived minus a tire on one of the hind wheels, having traversed 40 kilometres in that condition. This was a magnificent performance, being only one hour more than the express trains take to cover the same distance. The third vehicle, driven by M. Levegh, arrived two minutes later, and others continued arriving at intervals during the afternoon. They all came with a tremendous rush down a steep incline and pulled up sharp at the winning-post. There was an enormous crowd stretching for over a mile beyond the post, the people being kept in check

VOITURETTES LINED UP AT STARTING POINT.

"VOITURES" LINED UP AT STARTING POINT.

EN ROUTE—GIRARDOT LEADS, FOLLOWED BY LEVEGH.

THE HON. C. S. ROLLS LEAVES TO OBTAIN WATER.

small cars, which included a couple of Stanley steam vehicles, received the signal to start, and although one or two of them showed signs of "peevishness" even at this initial stage, they were eventually persuaded by their tamers—conductors, I mean—to join their companions and amble down the road to the accompaniment of a noise and clatter considerably greater than that produced by a fleet of large racers. At ten o'clock precisely MM. Girardot, Levegh, Rolls, and Broc, the sole representatives of the big cars, disappeared down the road, and at the Paris end of the *course* all was finished. The Hon. J. Scott Montagu did not start owing to an accident. M. Baras was the winner, arriving with his wife on a motor-

by the 8th Regiment of Infantry, which mounted guard on either side of the road.

The ultimate classification at Boulogne was as follows:—  
(1) Motor-Cycles—1, Baras, 5 h. 23 m. 17 s.; 2, Demester, 6 h. 13 m. 20 s.; 3, Osmont, 6 h. 24 m.; 4, Léa Lemoine, 6 h. 24 m. 10 s.; 5, Ducom, 6 h. 36 m. 6 s.; 6, Bertin, 6 h. 58 m. 43 s.; 7, Gleizes, 7 h. 27 m. 4 s.; 8, Richez, 7 h. 46 m. 10 s.; 9, Vonin, 7 h. 51 m. 13 s.; 10, Nicolas, 8 h. 5 m. 1 s.; 11, Caillois, 8 h. 9 m. 56 s.; 12, Balvay, 8 h. 37 m. 6 s.; 13, Dorigny, 8 h. 49 m. 8 s.; 14, Cormier, 8 h. 59 m. 12 s.; 15, Wattigny, 9 h. 7 m. 18 s.; 16, Deekert, 9 h. 9 m. 50 s.; 17, Chenard, 9 h. 10 m. 50 s.; 18, Gros,

10 h. 50 s. (2) Cars of less than 6 h.p.—1, Leuliette, 7 h. 9 m. 4 s.; 2, Lefèvre, 7 h. 33 m. 15 s. (3) Cars of 6 h.p. and upwards—1, Girardot, 4 h. 17 m. 44 s.; 2, Levegh, 4 h. 19 m. 20 s.; 3, Broc, 4 h. 32 m. 20 s.; 4, Rolls, 6 h. 11 m. 30 s. (punctured tire).

The average speeds maintained by the winners in each category were:—1, Baras, 45 $\frac{3}{4}$  kilometres per hour; 2, Leuliette, 32 kilometres per hour; 3, Girardot, 54 kilometres per hour.

## MOTOR-CARS ON THE CONTINENT.

(From Our Own Correspondent.)

### Daimler Motors in Austria.

REFERENCE was made in our issue of August 26th last to the formation of the Oesterreichische Daimler Motoren Gesellschaft (Bierenz, Fischer & Co.). We now learn that the new company takes over the factory of Fischer Bros., in Vienna, which is well equipped for the manufacture of motor-cars. All the Daimler patent rights for Austria-Hungary have been acquired, and Herr Paul Daimler, a son of the well-known inventor, is the manager of the new concern.

### A New Car.

A NEW type of motor hotel omnibus is being constructed at Cannes by M. G. Berret; the car is specially designed for use in the hilly districts of the South of France, such as Monte Carlo and Cannes. The vehicle will have seating accommodation for twelve persons, and will be fitted with a 12-h.p. motor.

### The Berlin-Baumgartenbruck Race.

THIS race, promoted under the patronage of the Committee of the Automobile Exhibition in Berlin, was contested on the 13th instant. Five cars and seven motor-cycles were despatched at 10 a.m., and the winner was found in the French rider Brauda, who, on a motor-cycle, covered the 65 kil. in 1 h. 36 m., including a delay of 14 m. at a level crossing. The second arrival was also a motor-cyclist (Kirchheim), but as he had not followed the correct route throughout he was not classified. The contestants finished in the following order:—1, Brauda (motor-cycle), in 1 h. 36 m.; 2, Kraus (motor-cycle), in 2 h.; 3, Bender (car), in 2 h. 14 m. 30 s.; 4, Oswald (motor-cycle), in 2 h. 23 m. 43 s.; 5, Hees (motor-cycle), in 2 h. 24 m. 40 s.; 6, Piccoli (motor-cycle), in 2 h. 36 m.; 7, Corne (motor-cycle), in 2 h. 42 m.; 8, Lob (car), in 2 h. 58 m.; 9, Ehrhardt (car); 10, Suberbie (car).

### The Automobile Club of France.

THE Club's villa in the Bois de Boulogne was closed on the 19th inst. for the season. Considerable damage was done to the trees by the violent storm of the 6th inst., and it will be some time before the grounds regain their usual aspect.

### Amateur or Professional.

THE Union Velocipedique Français, which has been for some time engaged on the question of classing participants in automobile races as amateurs or professionals, has adopted the following definition: "An amateur chauffeur is held to be the proprietor of an automobile carriage or cycle, mounting and riding a machine which belongs to him, and serving for his personal use, and also any motor-cyclist or automobilist who is popularly known as an amateur. Chauffeurs will not be permitted to take part in amateur races who make use of machines belonging to motor-car and cycle firms, or who made a profession of riding for such firms."

### Automobile Exhibition at Brescia.

ONE is somewhat apt to overlook the part that Italy is playing in the automobile industry, but as a matter of fact it is no insignificant one. In addition to recent races and fêtes an automobile exhibition has been held at Brescia and resulted, it is reported, in considerable business.

### The Bordeaux-Biarritz Race.

Beconnais, Winter, etc.

### Motor-cabs in Germany.

ENTRIES for this race will be received up to the 27th instant, on payment of double fee. Among the intending competitors in the various categories we note the names of Etienne Giraud, Albert Lemaître, Hoogland, Dulac,

### The Late M. Mayade.

ON Monday last at the church of Notre-Dame-de-la-Gare, Paris, there was celebrated a service commemorative of the death of the well known French chauffeur, Mayade, who was killed in an automobile accident at Chevanceaux exactly a year ago. Many English automobilists made the acquaintance of M. Mayade at the famous Brighton drive of 1896.

### An Alsatian Automobile Club.

ALSACE can now boast of an Automobile Club numbering already some fifty members. The headquarters will be either at Strasbourg or Mulhouse.

### Automobiles for Municipal Purposes.

THE local authorities of Schaerbeek, near Brussels, are reported to be considering the question of adopting motor dust carts and street watering wagons.

THE *Road* has a page of excellent automobile notes under a strangely and peculiarly drawn heading.

A MOTOR-CYCLE race is to be run off at Liège, Belgium, on the 24th inst., under the auspices of the Safety Club Liegeois.

MR. LOVE, founder of, and late managing director to, the Edinburgh Autocar Co., Ltd., has resigned his position in that Company.

THE Motor-Car Company, Ltd., has been registered with a capital of £25,000 to promote and protect the interests of the professions, trades, and industries engaged or concerned in or connected with the cycle, engineering, and motor-car building trades, etc.

MR. G. H. SMITH, of Anerley Park, who asks for handbooks on gas engines, is recommended the following works:—"The Gas and Oil Engine," by Dugald Clerk (London: Longmans Green & Co.); "Modern Gas and Oil Engines," by Fred Glover (Manchester: Technical Publishing Co.); and "Gas and Petroleum Engines," by A. G. Elliott (London: Whitaker & Co.).

ON Saturday, Mr. C. Hansell, of Montgomery Road, Sheffield, who with a friend was, according to a local daily, making a motor-car journey, met with an accident near Sheepbridge. The car was passing down a steep incline when the driver lost control, and it ran away. At the bottom of the incline the vehicle ran to the side of the road, pitching both gentlemen out. Although bruised and shaken, they fortunately did not sustain any serious injuries. The motor-car was badly damaged.

## The Automobile Club Autumn Tour.

IN rather chilly and threatening weather those participating in the tour of the Automobile Club to Folkestone assembled before the club-house in Whitehall Court on Saturday last. There was not a large gathering of the public, but those who had not been deterred from attendance by the climatic outlook were really interested spectators, and inspected the cars with almost critical eyes. Shortly after 10 a.m. the start was made, eight cars, a similar number of motor-tricycles, and a quadricycle starting within a few minutes of the leading vehicle. Others joined *en route*, and altogether the Club muster was a representative one, including: The Hon. John Scott Montagu, M.P., 12-h.p. Daimler, and the Hon. C. S. Rolls, 8-h.p. Panhard (joined after Paris-Boulogne race); Mr. and Mrs. Lyons Sampson, Benz Victoria; Mr. and Mrs. Edgar Soames, Daimler; Mr. Stopes, Miss Stopes, and Mr. Stopes, jun., Daimler; Mr. and Mrs. S. F. Edge and Mr. Napier, Panhard body and frame, with Napier motor; Mr. Charles Jarrott, Panhard car; Mr. Harold Heatley and Mr. Gresham, English Hurltu; Mr. Charles Cordingley, sporting dog-cart; Mr. and Mrs. Roger Fuller, Daimler; Mr. and Mrs. Kitto, 3½-h.p. Victoria; Mr. Frank Butler, Mr. Cecil Grimshawe, Mr. Robert Phillips, and Dr. Acworth, De Dion tricycles; Mr. Crampton, motor-tricycle; Mr. T. B. Browne and Mr. Dangerfield, on 4-h.p. Panhard; Mr. Friswell and friend, on Peugeot; Mr. Gretton, on new special design Iveagh phaeton, with hood. On the Club wagonettes (lent by the London Motor-Van and Wagon Co., and Daimler Co., Ltd.) were Mr. and Mrs. W. M. Hodges, Mr. Montagu Pilcher, Mr. and Mrs. Bertram Blount, Mrs. C. Johnson, Mr. T. W. Staplee Firth, Mr. Graham White, Mr. Julian, and Mr. H. Edmonds. Other participants were: Messrs. Phillips, on quadricycle; Mr. Roget, Mr. Walter, Dr. Hailey, and Mr. Wridgway, motor-tricycles; Mr. Mayhew, quadricycle; Captain Langrish and Mr. C. Johnson on Vallée; and Messrs. R. E. B. and Claud Crompton, H. J. Swindley, etc.

The roads were soon found to be in splendid condition, but very fast travelling was impossible owing to the many and sharp corners that had to be negotiated and the switch-back nature of the roads. The day was clear and breezy, and several sharp showers fell during the morning. Most unusually, and notwithstanding the careful itinerary mapped out by the secretary, a number of the cars took wrong turnings, and the majority of vehicles did not reach Maidstone—distance 42½ miles—till past two o'clock, and some arrived even later than this. Of course, the inevitable punctures happened, and delayed those who indulged in the troublesome luxury of pneumatic tires. Several cars went in error to Sevenoaks, and the passengers dined in that town, afterwards continuing their journey. A series of incidents happened on the way to Maidstone. Mr. Friswell, on a new 6-h.p. Peugeot, lost some time through his pump not acting properly, but this trouble being put right, the car travelled splendidly and at a high speed. A Daimler car ran into Mr. Wridgway's Phébus tricycle, breaking a sparking plug; while at a village called Igtham the Stanley steam car, driven by Mr. Searles and having as passenger Mr. Halsey, chairman of the Surrey County Council, ran away, the band brake having broken. On reversing, a gland broke, and the driver had no alternative (as the car was gaining speed) but to turn it into a brick wall, with disastrous consequences to the car but fortunately little injury to the riders. Unfortunately, somewhere near the same village a horse took fright; the man in charge fell, and the horse kicked him, fracturing one of his legs. He was taken to a doctor, and ultimately left in good hands. Mr. Crompton, on his tricycle, had trouble with his valves, but these having been attended to, the machine ran all right the remainder of the tour. Luncheon

was at the Royal Star, Maidstone, and was served from two to four o'clock, as the various occupants of the cars arrived. Very short stops as a rule were made, all being anxious to reach the destination, the journey being to most over unknown roads. Fortunately the surface was in splendid condition, and the gradients all seemed in favour of the motors, and fair times were made, most of the cars doing the journey within the three hours—although the route lay through the narrow streets of Hythe and Sandgate, finishing up with a nasty hill into Folkestone.

Between forty and fifty ladies and gentlemen sat down to dinner at the appointed hour, under the chairmanship of Mr. R. E. B. Crompton. Several stragglers came in afterwards, and there could not have been less than seventy of the members and friends present. Mr. Johnson, the secretary, rode on Captain Langrish's Vallée car, and that gentleman's trouble with a particular pneumatic tire must have been disheartening. At all events, the idea of repairing was abandoned, and the journey finished with the tire on the ground. Mr. Kitto's Benz also gave him trouble, causing his arrival at the hotel to be somewhat late. One of the best going cars on the road was Mr. Mulliner's Daimler, which, we understand, has been in use for thirty-one months, being the second English Daimler built. It was speedy on the level and took the hills in fine style. Mr. Edge's car, with the new Napier motor, was also speedy, and gained general approval from its smoothness of running. We have omitted to mention that just outside Maidstone there was a nasty obstruction in the road in the shape of a wagon-load of fresh-cut trees drawn by four heavy horses. The wagon must have been a very old one, for the axle and shafts were broken. The men in charge were of a very objectionable type and kept their horses right across the road, refusing to let any one pass, remarking that they had got to wait and that they intended keeping others waiting. However, after some persuasion all managed to get by.

Sunday opened breezy and dull, and, according to arrangements, Boulogne the destination to witness the finish of the Paris-Boulogne race. About forty members went aboard the steamer at mid-day, and it was noticed there were several others interested in motor-cars on the boat, including Mr. Critchley, Mr. Straker, etc. A comfortable passage was made and on arrival at Boulogne, standing on the wharf were seen a number of other friends and members, including the Hon. Scott Montagu, M.P., Messrs. Phillips, and Mr. Frank Butler, Mr. Riches and others. The scene at Boulogne was a gay one, the streets being decorated with venetian poles and flags. The point of arrival was in the town, and for a couple of hundred yards on either side of the finishing post, a rope line had been made, and this was guarded by French soldiers stationed every ten feet. A large crowd had assembled, and we learnt that one "quad" had arrived with a lady passenger on board. We walked up the hill and watched several of the competitors come in, one attracting attention by the absence of a tire on his near side driving wheel. We afterwards learnt that this rider had travelled on his rim for nearly eighteen miles. Another object to attract attention was a lady seated on the front of a "quad" in rational costume and minus a hat or bonnet. It was peculiar, to say the least, to see this lady swaying her body with the motion of the car. A machine we noticed in the race was what looked like two tricycles coupled together, with engines front and rear, two side wheels, and the two other wheels in front and rear. Both riders had to pedal hard up hill. Several of the quadricycles had two motors coupled, but these did not seem in any way better than the single motors, as in each instance the riders had to pedal hard. Only four of the big cars started, and of the three Englishmen

entered—Hon. Scott Montagu, M.P., "Flash," and Hon. C. S. Rolls—only the latter started. He had as passenger Mr. A. Bird, and finished last. Twelve minutes were lost through a punctured tire.

One incident was the stoppage at the bottom of the hill outside Boulogne of a car with a hood and glass front. There were four passengers, and after a lot of time spent in looking over the car the inevitable was accepted, and the crowd assisted, amidst jeers, in pushing the car up the hill. We may mention that the latter portion of the road over which the competitors travelled was of an execrable nature, and it was wonderful considering the state of the macadam that no accidents happened. Most of the English visitors got tired between the intervals of fifteen and twenty minutes waiting for the arrival of the competitors, and so strolled around, many of them taking dinner at Bailey's and other well-known restaurants. The eight o'clock boat home was caught, and after a somewhat "rocky" passage the hotel at Folkestone was reached at ten o'clock, the visitors arriving home with no very great opinion of the exciting nature of French motor-car racing.

On Monday the owners of several cars took a circular run to Canterbury, Sandwich, Deal, and Dover, back to Folkestone, a distance of about sixty miles. The run was much enjoyed by those participating, and the only incident of

Sir W. Crundall. There was a fair attendance of the public, and great interest was evinced in the parade of some twenty-five cars and motor-tricycles round the track. Hospitality was liberally dispensed, and the Mayor, in a few well-chosen words, welcomed the presence of the members of the Club, and declared his interest in automobiles. The show if small was an interesting one. In all nearly twenty vehicles were on view, and some well-known firms were exhibiting. Taking the exhibits in the order of catalogue Messrs. Arnold & Sons, of East Peckham, Kent, had two English-built Benz cars on view, the bodies being of the "dog-cart" order. Messrs. Hewetsons, Limited, of Dean Street, Oxford Street, London, had three of their Ideal Benz cars and a parcel van on view. Mr. Harding had a miscellaneous stall of accessories, Buffoline noiseless raw-hide gear-wheels, Pratt's motor-car spirit, etc. Clarkson & Capel's steam lorry was shown, also the well-known wagonette of the Liquid Fuel & Engineering Co. The same firm displayed a new lorry, as well as an omnibus fresh from the works at Cowes. This 'bus is built to travel up the dreadful Castle Hill at Dover six times a day, and is built to the order of the Dover and East Kent Motor 'Bus Co., Ltd., being the third of what is intended to be a large fleet of motor-vehicles. This new omnibus is named the "Titan," is convertible to a lorry, and comprises several improvements on previous vehicles.

THE PARIS-BOULOGNE RACE—TWO SNAPSHOTS TAKEN NEAR FINISHING POINT AT BOULOGNE.

note was the presence off Dover of two first-class cruisers, the "Niobe" and the "Diomed." A flotilla of six torpedo boats also passed while the party were having tea at the South Eastern Railway Hotel. The Castle Hill into Dover caused general concern, its steepness, winding and devious course, and looseness of surface rendering it highly dangerous. The band brakes of two cars fired, and Mr. Grimshaw's tricycle got beyond his control, running away at a great pace. He had to face the ordeal of a flock of sheep coming up the hill, but managed by letting off his exhaust in loud shocks to frighten them away and so escaped accident. It was, however, a very narrow shave. After passing through Dover two of the cars and a tricycle took a wrong turning and got on to the Downs and among turnip fields. In one field a traction engine, with several travelling cars, was met, with the result that the tricycle has to be lifted up a bank and the cars to be backed about a mile. Two hours were taken to reach Dover, whereas on another day only about thirty-five minutes were taken. Among the visitors were Mrs. Kennard, the well-known novelist, and a gentleman on a Benz car.

#### THE EXHIBITION AT DOVER.

On Tuesday the ranks of the tourists were considerably thinned, but still there was a good muster for the journey to Dover to the opening of the Automobile Show in that town, and to attend the reception by the Mayor of Dover,

It is geared low, and is specially built for the St. Margaret's journey over Dover Hill. The "reach" from back to front has been done away with, and a pivot in the centre of the angle iron frame has been introduced to nullify any vibration, while for the same purpose a new system of springs is used. In place of the  $\frac{3}{4}$ -in. tubes in the boiler,  $\frac{1}{2}$ -in. tubes are now used, and thus more power is available. This 'bus is the lowest speeded yet built by the Cowes firm, there being only one revolution of the wheels to twenty of the fly-wheel.

Messrs. Marshalls, of Belsize Works, Manchester, and the London Autocar Co. of Gray's Inn Road, London, W.C., exhibited the now well-known "Marshall-Hurtu," while the National Motor-Carriage Syndicate, of 37 Walbrook, E.C., showed the Joel electric victoria, which was on view at the Agricultural Hall in July last. This vehicle was moving round the track most of the day, and gained general approval by its silent action and ease in running. Our friends of Holland Park Avenue, the Automobile Association, Ltd., had as usual a fine exhibit, including two Orient Express cars, a "Tourist," a small Mors, a Barrière tricycle, and a handsome Waverley electric phaeton.

Messrs. Gibbon Bros. (of the Butler Motor Co.), Belmont, Surrey, had on view a fine show of accessories, and at the time of our visit Mr. Gibbon was anxiously awaiting the arrival of four Butler motor-tricycles which were on a steamer fast stuck on a mud bank! However, late on Wednesday, these duly reached the grounds. The Steam Carriage and Wagon

Co., Ltd., of Homefield, Chiswick, exhibited a large van, built to the order of Messrs. Schweppes, the well-known mineral-water manufacturers. Also on the ground was Mr. Harmsworth's Columbia electric car, which had been lent to the Mayor for his use during the show, and running about was the British Motor Coupé Company's 12-h.p. Canstatt Daimler charr-a-banc, constructed to carry twenty people, and several of the same Company's well-known coupés.

On Wednesday most of the cars returned to London, but a few stayed over to again visit the Dover show.

The trials in connection with the show were held on Wednesday, the judges being Major Holden, Professor Boys, Mr. Worby Beaumont, and others, the arrangements being in the capable hands of Mr. Beeton and Mr. Johnson, assisted by the local committee. For the heavy class, three vehicles were entered—the Liquid Fuel Engineering Co.'s lorry, the same firm's 'bus (entered by the Dover Motor-Bus Co.), and the Thornycroft vehicle. The distance was about fourteen miles over very hilly roads, and all the vehicles successfully went through the trials. For the light cars there were five entries, viz.: Hon. C. S. Rolls' racing Panhard car, Mr. Gretton's Iveagh phaeton, a Marshall-Hurtu (driven by Mr. Mann), an Orient Express (driven by Mr. Frentzel), and Mrs. Kennard on her Benz. Up to the time of going to press no official reports had been issued, but we understand the first two cars did the journey of three miles round the track and twenty-four miles on the road with a non-stop absolute; the Marshall-Hurtu also did well.

### THE MORS CARRIAGE.—III.

By VELOX.

(Continued from page 413.)

SUBSEQUENT investigation, however, shows that the designers in departing from the obvious method of placing the chief weight centrally were not swayed in this direction by lack of thought. The power transmission devices had to be accommodated, and apart from the question of the distribution of the weight it was found to be of greater importance to secure that the tractive effort of the belts should be exerted on the centres of the transmission shafts rather than on the ends, as would be the case were the motor centrally placed. In fact, it was obvious to the designers that it was of more importance to divide the strain of the bearings equally than to place the weight of the motor in a central position, especially as they had the power to counterbalance the uneven distribution of the weight of the latter by other heavy portions of the completed mechanism. As a matter of fact, the weight of the transmission pulleys, that of the dynamo and its gear, and that of the water reservoir attached to the left of the carriage frame, exactly balance the weight of the four cylinders of the motor and their necessary parts. The backward position chosen for the motor was also dictated by substantial considerations. In such a position no inconvenience is caused to the passengers should the motor be emitting fumes owing to want of attention or excessive lubrication. A similar reason dictated the fencing of the exhaust boxes and their final collective chamber.

On reference to Fig. 2 (p. 412 *ante*) it will be found that in front of the cylinders, a little to their right, the carburettor is placed. This is of the constant level type, controlled by the customary float mechanism, and will be fully described later. At a point a little more to the front, and a little to the left side of the cylinders, will be seen the open box which contains the four self-induction coils. It may here be remarked that throughout the mechanism and appliances it will be found that each cylinder of the motor has its own particular set of parts. The dynamo generating the current for furnishing the igniting spark is also to be seen on the left side of the engraving (Fig. 2), this being placed quite at the back of the car and on the main or motor shaft. This appliance is balanced by the self-acting lubricating device, placed also at the back

of the car, but in the extreme right-hand side. At the back also, between the rear pair of cylinders and the high and low speed pulleys, is placed the speed-reducing gear or "demultiplication" device, which works in a gear case of ceruse filled with oil.

On the main or motor shaft are placed also the mechanical devices for actuating the lubricator and the water-circulating pump. The main store of cooling water is accommodated in the tank, to be found directly under the footboard of the driving seat; it is not visible in either Fig. 1 or in Fig. 2, and can only be seen by looking under the vehicle and from the front thereof. The circulating pump sucks water from this container and forces it around the bottom portions of the cylinders after having first caused it to pass through the coil of tubes provided with radiators, sometimes described as a condenser. After leaving the cylinder walls the water is conveyed by the four tubes radiating from the cylinders, and plainly visible in Fig. 2, to the small reservoir, shown to be attached to the left side of the carriage frame. From here it falls by gravity into the larger reservoir previously alluded to, and placed under the driving seat footboard. By this arrangement the pump is assured a certain charge and a constant level of water is maintained in main reservoir.

In describing Fig. 1 we alluded to the small lever working in a ratchet placed on the right side, and outside the carriage body. In Fig. 2 this lever itself is not shown, but the gears connected to this lever are plainly seen. Through the medium of the gearing this outside lever controls the movement of the articulated rod, which is to be seen on the right-hand side of the vehicle, close to the top of the outer edge of the car body. On this rod are carried two swinging arms, which in their turn control two doubly-articulated rods connected up to small discs in such a way that the latter can be made to completely cover, or to leave entirely open, four air inlets communicating with the carburettor mixing chamber of the motor. When the outside or ratchet lever is brought quite forward the air passages are completely open, and the motor can then attain its highest designed speed. On the other hand, if this lever is moved backward the articulated rods commence to move these discs, so that they gradually close these four air inlets; if it is placed backward so far as is permitted by the ratchet, then we find that these air inlets are completely covered by the discs, and the motor is consequently "choked" by reason of its deprivation of air, and therefore stops working. It is quite easy to see how great a convenience this appliance becomes when the car is progressing through crowded traffic. The motor can be so delicately fed with air that its speed is increased or decreased as occasion demands.

Amongst other mechanical devices shown in Fig. 2 is the friction-clutch placed centrally between the two transmission pulleys and the four cylinders of the motor. It is partly obscured in the illustration by the gear case containing the speed-reducing mechanism. Although we have spoken of the transmitting pulleys on the main or motor shaft, we have not yet alluded to their respective pairs of fast and loose pulleys, to be found on the second or intermediary shaft. These are not plainly visible in Fig. 2, although some portions of them may be seen if the direction of the belt is followed.

In the succeeding portions of this description we propose to examine in detail each distinctive organ of the beautifully conceived and well designed collection of mechanical parts which as a whole make up the world-famed Mors car.

(To be continued.)

As a result of Goodwin's recent road record and the great speed attained by the motors which paced him, the Chief Constable of Huntingdonshire has issued public warning, which is widely posted throughout the county, to motor-car drivers, motor-cyclists, and cyclists to the effect that the police have received strict instructions to proceed against all who may furiously drive or ride their machines.

# The Berlin International Motor-Car Exhibition.

(Continued from Page 449.)

FIG. 1.—THE GESELLSCHAFT FÜR VERKEHRSUNTERNEHMUNGEN'S ELECTRICAL WAGONETTE.

AS stated last week, in addition to the electrical omnibus illustrated in our issue of August 11th last, the Gesellschaft für Verkehrsunternehmen, 43 Unter den Linden, Berlin, N.W., is exhibiting several types of electrical vehicles, including a wagonette, a 1-ton delivery van, and two droschken. The Company has decided to adopt standard frames on which different types of bodies can be mounted. A view of the tubular frame decided upon for vehicles capable of carrying a load, consisting of either passengers or goods, of from 500 kilog. to 1,000 kilog. is shown in Figs. 1 and 2, the former illustrating an eight-seated wagonette and the latter a 1-ton delivery van. It will be noticed that the bodies are suspended by strong plate springs on the frame, spiral springs being also introduced between the latter and the axles. The vehicles are propelled by a single Lahmeyer electro-motor attached to the frame through the medium of springs, and geared to the rear axle by pinions, working in a dust-proof case. A special form of differential gear is provided on the rear axle. The accumulators, which are of the Majert type, are located under the driver's seat. Doors are provided at each side of the car to permit of the battery being readily withdrawn, while the seat itself can be lifted up to allow the battery connections to be examined. We are unable to give the number, weight, or capacity of the accumulators, but it is stated that they are sufficient for a run of from 25 to 30 kilometres on one charge. Steering is effected through the front wheels by means of a vertical hand wheel. The controller switch is distinct from the steering standard, but in future vehicles it is intended to combine the two. The controller is adapted to take a number of positions, four forward speeds and one reverse motion being provided, while in one position of the switch the motor can be made to act as a powerful electrical brake. The road wheels are of strong construction, and are fitted with ball bearings, the front pair being mounted on the usual vertical pivots. The weight of the types of cars illustrated in Figs. 1 and 2, complete with accumulators, is given as 1,800 kilog., or 1 ton 1,720 lb. Shoe brakes on the rear wheel tires, controlled by a foot pedal, are provided. Fig. 3 illustrates the Company's electrical "droschken," which are mounted on

another type of standard tubular frame intended for light vehicles, such as coupés, victorias, etc. The suspension of the body on the frame is similar to the system adopted in the wagonette. In the light vehicles, however, two electro-motors are employed, one being geared to each of the rear wheels. The accumulators are arranged under the front and rear seats, and are stated to have a capacity sufficient for a run of about 40 kilometres on one charge. Steering is effected by a bar; the controller switch, which in the light class of vehicle is combined with the steering standard, is adapted to give four forward speeds, one reverse motion, and an electric brake. The droschke weighs with accumulators about 1 ton 180 lb., and can, it is claimed, attain a speed of 20 kilometres per hour.

A number of Columbia electric vehicles are to be seen on the stand of the Motorfahrzeug und Motorenfabrik Berlin Gesellschaft, of Marienfelde, near Berlin, this Company holding the licence for this type of vehicle for Germany, Austria, and Hungary. A new firm in the automobile world is Heinrich Scheele, of Cologne, which is taking up the construction of electric cars on an extensive scale, no less than four vehicles, a two-seated phaeton, a four-seated phaeton, a mylord, and a delivery van being on view at the exhibition. The mylord is fitted with two Korting electromotors, geared by chain and chain wheels to the rear axle. The battery consists of a set of accumulators of the "Colonia" type, supplied by Messrs. Leffer & Co., of the Colonia Accumulatorenwerke, Aix-la-Chapelle. The accumulators, which have a capacity of 75 ampere-hours, and weigh 560 kilog. (about 11 cwt.), are arranged partly under the driver's seat and partly at the rear. The controller is arranged to give three forward speeds and a similar number astern. The batteries in this vehicle are always in tension, the variation in speed being obtained by placing the motors in parallel or in tension and introducing resistances into the circuit. Steering is effected through the front wheels as usual. A band brake, controlled by a foot pedal, and acting on the rear axle, is provided, as also shoe brakes on the rear wheel tires. The weight complete of the mylord is given as 1,600 kilog. (1 ton 1,280 lb.). In the delivery-van only one electro-motor of 6 h.p. is used.

That the well-known electrical engineering firm of Messrs. Siemens & Halske, of Berlin, are going in extensively for motor-vehicles is evidenced by their exhibit at the show. This includes a number of electro-motors and other electrical apparatus for automobiles, but the principal interest centres on

FIG. 2.—THE VERKEHRUNTERNEHMUNGEN CO.'S ELECTRICAL DELIVERY VAN.

the large electrical omnibus displayed. This car, which we hope to deal with at length in a subsequent issue, is of such a gauge that it can run on tram lines, and is also arranged that it may take current from either the overhead conductor of the "trolley" tramways or from the conduit lines.

FIG. 3.—THE VERKEHRUNTERNEHMUNGEN CO.'S ELECTRICAL DROSCHKE.

Electric vehicles are also shown by Herr C. Kleimt, of 74 Neue Königstr., Berlin, N.O.; Herr A. Krüger, 8 Spittelmarkt, Berlin, C.; Messrs. Kruse Bros., 45 Gänsemarkt, Hamburg; the Kuhlstein Wagenbau, Charlottenburg, Berlin; the Vulcan Automobil Gesellschaft, 45 Ritterstrasse, Berlin, S.W.; Messrs. Jacob Lohner & Co., of Vienna; and Messrs. O. L. Kummer & Co., of Dresden.

(To be continued.)

## MIDLAND MOTOR NOTES.

By "HERCULES."

### English Workmanship.

IN an interesting article on motor-vehicles the *Daily Mail* supports the assertion I made recently in these columns—based on the authority of men who have run continental motor-cars for some time—that the excellence of English workmanship compares most favourably with that of continental makers. One of the reasons why continental-built cars are pressed for sale in this country is, says the *Mail*, because there is little effective competition at present from home manufacturers. This may have been so up to the present season, but if the writer had visited as many factories as I have during the past few weeks he would have seen that English makers are doing their utmost to remedy this. Everywhere the greatest activity prevails amongst those firms which have taken the business up, and the number is being added to almost every week by establishments which have gained a reputation for the very best work in the cycle trade.

### The "Critchley" Car.

It is pleasing to note that the Daimler Co.'s "Critchley" car is thought so highly of by the writer. He says that the "Critchley," at about £200, will be the best thing in the English market, and that a large number of orders have been placed with the Coventry firm for this car. Its manipulation, it is added, could be learnt in a fortnight, and once purchased the cost of up-keep is nothing like that of a horse.

### Automobilism in Coventry.

IN Coventry one meets with motor-vehicles of one type or another almost everywhere. The croak of the horn is well-nigh as familiar to pedestrians as the tinkle of the cyclist's bell, and is certainly more respected. A few motorists favour the motor-bicycle, but it is not often they are met with. Motor-tricycles are more popular, but the palm has to be given to machines "built for two." Cars are also numerous, and it is an ordinary thing to see two or three of these passing along the street with a full complement of passengers. Oftener still they are to be met on the fine roads leading out to Birmingham or Kenilworth and Leamington, bowling along at a merry pace, the passengers showing not the slightest sign of alarm, but, on the contrary, evidently appreciating "the fun" to the full. Cars are also running constantly between the various works and the railway station, and the larger *chars-a-banc* are coming into use for trips into the country.

### Motor-Cars and Coventry's Narrow Streets.

THE narrow streets for which the "city of spires" is noted test not only the capabilities and judgment of the motorist, but provide plenty of opportunities for demonstrating the perfect control he has over his machine. Some of the drivers wind their way in and out of the traffic at a leisurely speed, others proceed cautiously through the busier streets, whilst others, again, dash along at a rate which causes certain flutterings among the more nervous. But the drivers are thoroughly on the alert, and are perfectly confident they can bring the vehicle to a standstill the second the brake is applied. I don't remember an accident in the city which has been caused by a motor, but I have seen one or two narrow shaves. Collisions with other vehicles have only been avoided by the ease with which the motor-car is steered, and accidents prevented by the watchfulness of the driver and the promptness with which the vehicle has been pulled up. For example: A cyclist was spinning along the other morning at

a good pace, followed within a yard or two by a big motor-car. To clear a cart standing at the side of the road the cyclist ran over the tram lines, and as the water cart had been there a few moments before his wheel skidded and he was brought to the ground. This happened, it goes without saying, without the slightest warning, but so promptly did the motorist act, and so well was the machine under the control of its brakes, that the falling of the cyclist and the stopping of the motor were practically simultaneous. Had a horse and cart been behind him the cyclist could hardly have escaped so luckily.

#### The Humber Co.'s Productions.

THE Humber Co., Lower Ford Street, Coventry, will have a much more extensive exhibit than last year at the forthcoming Stanley Show, and their motor "quad" will occupy a prominent place. A number of light sociable cars will also be shown, and in fact every grade in cars up to one nearly approaching the Daimler in size. The firm are experiencing a good demand for their tandem quadricycle, of which a good number have been turned out this season, and they are also devoting a great deal of attention to a small carriage for two which will shortly be placed on the market by them. The whole of the present resources of the firm are, I understand, brought into play in coping with the orders coming to hand and in the experiments which are being made.

#### Motor-cars in Wolverhampton.

IN Wolverhampton, whilst the firms engaged in the motor industry are meeting with the success their enterprise deserves, there seems to be some hesitancy felt by those who are in a position to become purchasers of motor-vehicles. At present I only know of one gentleman outside the trade who owns one. There is, I am told, a splendid opportunity for a service of motor-cars between the Square and Penn, a thickly populated suburb. At present a 'bus makes the journey three times a day, charging 3d. for the two miles—not at all a bad rate from the 'bus owner's point of view, but even at this charge the 'bus is always crowded outside and in. Motor-car services have been running at Bedford for some months now, the charge per mile being 1d. The vehicle seats a dozen passengers, and in addition to the driver there is a boy at the back for the collection of tickets. I believe the venture has met with a gratifying success. A similar service is about to be inaugurated at King's Lynn. If at these places, why not at Wolverhampton, where there is good reason to believe a motor-service would be even a greater success?

#### A "Perry" Motor-Tricycle

MESSRS. PERRY & Co., Lancaster Street, Birmingham, the noted steel-pen manufacturers, have been for a long time experimenting with a motor-tricycle manufactured by themselves. The motor is  $1\frac{1}{2}$  h.p., and the tricycle has been running on the road for some time. Messrs. Perry and Co. have received a number of orders for motor-tricycles, and are also turning their attention to the question of constructing motor-cars. This firm has long been connected with the cycle trade, and there is no doubt that in the manufacture of motor-vehicles they will give equal satisfaction to the public as they have in all former undertakings.

#### A New Lamp.

MESSRS. COOMBS BROS., Ltd., Aston, Brook Street, Birmingham, are placing on the market a lamp suitable for motor-tricycles and cars. The lamp is neat and pretty in design, the clip is strong, and a brilliant light is obtained. All the parts are rivetted, whilst those exposed to the heat are not dependent on soldering. The lamps can be obtained in

pairs or in singles, with a spring bracket fixed at the back. Messrs. Coombs Bros. are well-known manufacturers of cycle, ship, railway, and other lamps.

#### More Cycle Firms take up Motors.

To my knowledge several firms who until recently confined their attention to cycle accessories are waking up to the necessity of catering for motor-vehicles, and are adding to their stock various articles required by motor men.

#### Motor-Cars for Hire.

THE Midland Motor Agency, Acocks Green, Birmingham, of which Mr. W. A. J. Aldred is the secretary and manager, is arranging to supply motor-cars and tricycles on the hire-purchase system "in order to meet the convenience of those to whom a car would be a boon but who cannot afford to put down the cost at once." The Midland Motor Agency holds the district agency for the Benz cars, and has also several second-hand vehicles in stock.

#### Mr. G. Iden and the "Princess" Car.

MR. IDEN, of the Motor Manufacturing Company, Coventry, was prevented from joining the Automobile Club tour on Saturday by an unfortunate mishap to his "Princess" car. The car was despatched from Coventry on Friday night in charge of a competent driver and fitter, who were instructed to be at the Company's London offices at 9.30 on Saturday morning to join the Automobile Club. Mr. Iden left Coventry for London by the last train on Friday night, and on arriving at the Avenue Hotel found a telegram awaiting him stating "Car going very well." Consequently he was quite unprepared on Saturday morning to receive a wire as follows: "Turned car into bank. Buckled back wheel. It was impossible to run. Getting it to the station." Mr. Iden immediately replied "Wait my arrival before loading," and at once repaired to Weedon, where the accident had occurred. Upon arrival he found that the front axle was badly bent, the frame twisted, wheel buckled and broken, cooler displaced, pipes bent, and the car generally a wreck. He decided that he would drive it back to Coventry, if possible. He had the wheels stripped, sent to Coventry to be rebuilt, and these were returned within four hours. In the meantime, he took the axle to a village blacksmith's shop, and made such general repairs as would enable him to drive the car back home by road. The journey, which was started soon after midnight, was accomplished without further mishap. At Coventry the car was promptly put in order, and Mr. Iden was able to drive out with it on Tuesday night, when the ten miles between Coventry and Warwick were covered in twenty-five minutes. Naturally Mr. Iden was disappointed in not being able to take part in the Automobile Club tour, but the accident has shown not only how promptly the Motor Manufacturing Co. can execute repairs, but how invaluable a cool head is in such perplexing circumstances. The accident, furthermore, should be a warning to drivers. It was caused through the driver, himself thoroughly experienced, allowing the fitter to "try his hand."

THE directors of the Caledonian Motor-Car and Cycle Company, Ltd., at a board meeting last week resolved to enter the motor-car business on a large scale, and intend to keep for sale and hire a goodly number of the latest types of both large and small motor-carriages. The Company have been appointed sole agents in the North of Scotland for the Canstatt Daimler motor-cars and the United Motor Industries Company, Paris, and they will have on show, before the new year all the latest types of Canstatt-Daimler, Accles-Turrell motor-carriages, De Dion tricycles, etc. They will also be in a position to repair any make of motor-carriage.

## CORRESPONDENCE.

### FROM PEKIN TO LONDON.

TO THE EDITOR OF *The Motor-Car Journal*.

SIR,—Referring to your paragraph *re* Dr. Lehwess' proposed motor trip from China to London, perhaps the doctor could persuade R. L. Jefferson to accompany him. Mr. Jefferson has already successfully undertaken cycle journeys to Constantinople, to St. Petersburg and back, and to Khiva, so that the experience gained on these jaunts should be useful on a long motor journey through foreign lands. Mr. Jefferson is also a journalist of no mean ability.

Coventry, Yours faithfully,  
September 15th, 1899. H. W. BARTLEET.

### THE ABERYSTWYTH PERSECUTION.

TO THE EDITOR OF *The Motor-Car Journal*.

SIR,—I have read the letter of Mr. W. H. Hollier, of Aberystwyth, which appeared in your columns of the 15th instant.

The prosecution in this case undoubtedly resolved itself into a persecution; and it is quite clear that the ignorance of the magistrates turned the machinery of the law into an engine of persecution. In the first place the summons was bad, as the four-mile limit only applies to traction engines and road rollers. The Court was apparently in total ignorance of the Act of 1896, which, with the regulations thereunder, allows a speed of twelve miles an hour. This does not necessarily mean that one may travel at that rate in thoroughfares unsuited to such a speed by reason of the traffic. Objection ought to have been taken, and an application to state a special case for the High Court should have been made at the time, and no doubt the stupid decision would have been upset and the magistrates ordered to pay the costs.

The observation of Sir J. Szelumper that motor-cars were a nuisance, and that "the public would do their best to put them down" is a piece of gratuitous ignorance which points out the inadvisability of putting the administration of the law into the power of such persons. It may be assumed from his remarks that Sir J. Szelumper arrogates to himself wisdom superior to that of our legislators at Westminster, who have passed an Act to "put them up," not "put them down."

Stephenson had to put up with terrible opposition born of ignorance and stupidity when he commenced running locomotives, but most of us had hoped we had emerged from the dark ages, and thought it impossible to find any body—not to mention a magistrate—exhibit such crass stupidity as to declare a magnificent new invention, and one which the country has recognised by an Act of Parliament, a nuisance.

The bye-law of 1884 is ineffective, and bye-laws to affect motor-cars must be made under the Act of 1896. Mr. Hollier had a clear case for appeal, and should have applied for a special case to be stated after the decision was given.

Folkestone, Yours, etc.,  
Sept. 18th, 1899. T. W. STAPLEE FIRTH.

### THE CINEMATOGRAPH ON TOUR BY MOTOR-CAR.

TO THE EDITOR OF *The Motor-Car Journal*.

SIR,—My route for the past week has been Whicham, Rusland, Hawkshead, Troutbeck, Windermere, Greenodd, and Staveley, meeting, on the whole, the best roads we have yet had to travel over, although two or three long and steep hills have been surmounted despite the pessimistic prophecies of some of the local quidnuncs, who declared we could not do so. If they had only seen Irton Fell and Sandbank Hill, which I described in a previous letter, they would not have considered them so formidable. Owing to the non-arrival of our petrol through the delay of the railway company, we had to drive to Whicham and Rusland from Broughton, but

started on Wednesday again with the car for Hawkshead, a quaint old village between Coniston Water and Lake Windermere, passing Mr. Ruskin's residence *en route*. On Friday we ascended the steep and rugged hill at Troutbeck on the road to the famous Kirkstone Pass, and successfully accomplished the journey. Quite near our location at Troutbeck occurred a day or two previous the accident to an Edinburgh car concerning which I enclose you a couple of cuttings from the local papers. The account given in one has quite an unconscious touch of humour about it, for we read that "all but the woodwork was consumed," which caused a friend of mine to remark in a pensive way, "Good old wood!" to remain unburnt whilst the metal blazed away. Touching this accident, hearing that the party were from Edinburgh, of course our sympathy was very keen. I do not think motorists should be disheartened by these occasional mishaps. We, in our turn, after getting up to Troutbeck had to descend the same brow, and it certainly was an experience! Our tire and band-brakes both applied hard home could not hold the car, and as we were about half-way down we could smell the leather of the band-brake singeing away. At the bottom of the hill was a sharp turn to the right on to the Ambleside road, with a nasty dip like a deep gutter caused by recent rains to negotiate at right angles, and although the car was fairly running away we kept our heads, and, Mr. Sinclair having a firm grip of the steering handle, we dashed into the dip, and skilfully turning at the right moment with the least possible swerve we fairly bounded on to the Ambleside road with a momentum that was something to be remembered. We found that we had fractured the water pipe just at the joint underneath, and on getting into Ambleside enlisted the services of Mr. Tyson, cycle agent there, who soon brazed it afresh, and added a piece of wood to each side of the hand-brake to enable us to get an even tighter grip. Off we went to Greenodd, which was a lovely drive, ten miles of it being by the side of charming Windermere.

We rode the twenty-six miles yesterday from Greenodd to Staveley in drenching rain, which naturally made the roads heavy. Another gentleman I have met *en route* has expressed his determination to go in for a car, and I have given him every encouragement to do so.

Yours, &c.,

J. T. WEST,  
Staveley, near Kendal, *Manager of the Modern Marvel*  
Sept. 19th, 1899. *Co., Ltd. (of Edinburgh).*

[From the cutting enclosed relating to the accident at Troutbeck we learn that while the motor-car was so seriously damaged that it had to be "abandoned," the occupants were uninjured. It appears that "the visitors found the ascent too steep, and after struggling for some distance the petroleum ignited and the motive power ceased. The boiler burst and set the car on fire, and presently all but the wood-work was consumed." Had the local reporter been on the "derelict" motor-car he could hardly have more completely muddled his account.—ED. M.-C.J.]

### ENGLISH v. FRENCH-BUILT MOTOR-CARS.

TO THE EDITOR OF *The Motor-Car Journal*.

SIR,—We, as an English manufacturing company, are naturally very much elated at the prospect of a complete boycott of everything French. Hitherto, owing to some absurd prejudice, Englishmen have favoured automobiles of French manufacture, and have sent English money to France when it is quite possible to obtain in England English-made automobiles which compare favourably with those of French manufacture, and which are in fact very much better made than any French machine yet produced. Should the boycott become an accomplished fact, the English automobile manufacturers will undoubtedly receive a large number of orders for machines from Englishmen who would under other circumstances entrust their orders to French makers, and it is therefore probable that the disordered state of internal

affairs in France may have the effect of stimulating the automobile and other industries in England to such an extent that in a few months time this country will have considerably improved its already flourishing condition.

"It's an ill wind that blows nobody any good."

Yours faithfully,

THE MOTOR MANUFACTURING CO., LTD.,  
47 Holborn Viaduct, E.C., ALFD. BURGESS,  
September 19th, 1899. Secretary.

[It is quite clear that the proposed boycott of the Paris Exhibition will not take place. Probably a good way of attaining the object suggested by our correspondent will be for English motor-car manufacturers to secure the entry of British-made vehicles in Continental races, and win the prizes hitherto monopolised by the machines of Continental manufacture.—ED. M.-C. J.]

## SCOTTISH NOTES.

### An Incident in the Trossachs.

THE man who is possessed of a reasonable amount of *savoir faire* is sure to get on in this world, and the remark is specially applicable to chauffeurs. I was having a chat this week with a gentleman who had just returned from a most enjoyable motor-car tour in the Highlands, and in the course of our talk he mentioned a "big spill" which had occurred, but fortunately not to the automobilists. It appears they were proceeding along at a moderate pace, when they saw a two-horse brake coming round the corner of a road at right angles to the one over which they were travelling. The sole occupant of the vehicle was the driver, who came rapidly round the corner without keeping a proper look-out. As a matter of fact he did not see the motor-car till he was shot into a ditch at the roadside, where he was in a position to contemplate the "horseless wonder" to his heart's content. One of the horses had seen the car, however, before him, and plunged to the side, falling into the ditch, too, and upsetting the wagonette. Almost instantly the motor-car party had their engine stopped and the machine drawn up at the side of the road, while all were soon busily employed assisting the unfortunate driver. The horses' heads were held down till the harness was loosened, the "Jehu" assisted out of his damp seat, the vehicle put on its wheels again, and affairs generally put right all inside five minutes. And then—this is where the result of a little tact came in—the driver profusely apologised for having occasioned so much trouble, and admitted that the fault was entirely his own as he had not kept a proper look-out, thanked the automobilists for their prompt assistance, and parted the best of friends. His vehicle had to run in connection with the steamboat service on Loch Katrine, and it was of vital importance to him that he should be up to time. Through the prompt assistance of the party who had innocently been the cause of his spill he was enabled to keep faith with the public. It is pleasing to have to record such a happy termination to what might have proved a very nasty accident. The usual result of such a *contretemps* in mutual recrimination is a police-court summons a week or two afterwards for the chauffeurs.—*Verbum sap.*

### "Still They Come!"

AGAIN news reaches me of more of the Scottish nobility taking kindly to the motor-carriage. Lord Hamilton of Dalzell, or at least the younger members of the family—his lordship is not in the best of health at present—have been displaying a keen interest in the horseless vehicle. An elegant motor-wagonette was at Dalzell, his beautiful estate in Lanarkshire, last week, and the car was kept busy all day gliding through the "policies" with beves of fair ladies and several members of the sterner sex, who were experiencing their first ride on the new carriage. Captain Campbell, the eldest son of Lord Stratheden and

Campbell, who is married to a daughter of Lord Hamilton, expressed himself as hugely pleased with his trial, while the members of the Hamilton family were equally delighted, and we hope to hear soon that they have determined to follow the lead of other members of the aristocracy and become possessors of cars of their own.

### Progress.

I REFERRED recently to seeing a certain popular master of foxhounds out driving in a motor-car, and commended the broadminded and sportsmanlike spirit shown by him in not condemning a thing untried like too many of his sporting brethren who appear to have an unmitigated contempt—not to speak of hatred—for the motor-car. I was therefore the more pleased last week to see him in a comfortable little motor-wagonette, along with his wife and another lady and gentleman friend, "whirring" swiftly along a road in the neighbourhood of Lesmahagow. On making inquiry I found that they had been paying calls on friends in various parts of the country, and had adopted the automobile as being the latest and most up-to-date fashion of getting through this pleasing function. When I saw them it was raining heavily, but like true sportsmen and women they were "all smiles," and appeared to consider the rain a matter of too small moment to spoil the novelty of the run. All this indicates substantial progress, and goes in support of the belief which is held by the best informed people in the motor-car world that 1900 will witness a "boom" in motors.

### Touring Routes in Scotland.

I HAVE this week received a letter from a correspondent who has been touring in the southern counties of Scotland. He writes as follows:—"I have been tapping virgin country this week, and the excitement and abounding astonishment manifested by the populations of the scores of villages in the country I traversed on my 'Stirling-Daimler' reminded me of my experiences in the very early days of the motor-car movement in this country. We have got so accustomed to self-propelled vehicles in our own part of the country that we are becoming, I am afraid, quite unconscious of the mechanical achievement which carries us along so sweetly hour after hour with no visible effort until we become oblivious of distance. It is when we get away, however, from the 'beaten tracks' and make our way into the remote corners of the country, as I did recently in the county of Wigtonshire and the Mull of Galloway, our ungrateful memories recall us to a sense of our privileges and to a fresh admiration of the skill and industry which has produced the modern motor-car. As a route for good roads and for variety of scenery I can recommend the following: Glasgow to Kilmarnock and on to Ayr (32½ miles)—the land o' Burns; continue through Maybole to Girvan (21½ miles). The road the whole way is excellent, and 20 to 30 miles can be had on 'top speed' running without change. From Girvan to Ballantrae (13 miles) the road is along the edge of the sea, and in parts has scenery as wild as is to be found in the wildest parts of the Western Highlands. From Ballantrae the road runs inland through fine wooded country, and the descent of Glen App is charming. After a few more miles running, the shores of Loch Ryan are reached, and for almost the whole way the road skirts the Loch to Stranraer. From Stranraer, Portpatrick (8 miles) is easily reached. The Mull of Galloway Road along the shores of Luce Bay is fair and the scenery varied. The route I have briefly sketched is one of the most delightful I have covered by motor-car, and well worth making a special note of."

"BROWN HEATHER."

THE Strathmore Automobile Co. has just been formed at Kittery, Me, U.S.A., to deal in self-propelling vehicles. The capital is £200,000.

## RECENT EXPERIENCES WITH STEAM ON COMMON ROADS.\*

BY JOHN I. THORNYCROFT, F.R.S.

AS from the very earliest times means of communication and of transport have been of the first importance, it was inevitable that in the very infancy of modern engineering men should turn to the steam engine for a solution of the ever-pressing problem of rapid and economical transport; and accordingly we find that nearly three hundred years ago Ramsay invented and patented a steam wagon, followed some years later by the illustrious Newton.

Coming down to more recent times, to mention only one of the several prominent builders of steam coaches in the early part of this century, I may remind you that Mr. Hancock's vehicles ran fairly successfully at speeds from nine to fifteen miles per hour, plying daily through the crowded London streets between the City and Paddington, nearly seventy years ago.

The earlier builders had, however, to contend against almost insuperable obstacles: the general want of good roads off the great highways, the rudimentary condition of engineering manufacture, and the hostility of the great mass of the nation, made permanent success impossible at that time.

Experience gained with the water-tube, or "express," boiler, combining the three essential requisites of high pressure, lightness, and durability, and the small quick-revolution engine, together with the very greatly improved materials and manufacturing processes of recent years, enable us to now attack the problem with every prospect of lasting success.

But progress is, unfortunately, still impeded by the law: the effusively welcomed "Locomotives on Highways Act, 1896," though removing some obstacles, and thus giving an impetus to the manufacture of the lighter types of road locomotive, is found to be a very imperfect measure, and must be materially amended to enable the widespread demand for speedier and more economical transport of heavy loads, on ordinary highways, to be met.

The clause that presses most hardly is that restricting the weight of vehicle, unladen, to less than 3 tons; one finds that merchants and manufacturers insist on loads of from 5 to 10 tons being dealt with, and it is commercially impossible to build a durable vehicle for this service within the above limit of tare; I say "commercially" and "durable," as it is quite conceded that, by the free use of aluminium, special steels, and special workmanship, an expensive vehicle may be easily built which shall perform this arduous task admirably during a short period, as, for example, on a series of trial runs; but it is needless to point out that this is not successful commercial production.

In France, makers are allowed a greater latitude, and have devoted themselves more particularly to the problem of passenger transit; they have found that to carry a load of about 1½ tons of human beings they require a tare of 4 to 5 tons; while I believe the ratio of tare to net need not be so great as this, it is yet desirable to point out that the wear and tear of vehicles due to road shock being a kinetic action varies probably as the square of the speed, so that the demand for greater loads at higher speeds involves the construction of vehicles of durability vastly greater than those at present in general use.

In Lancashire, loads of as much as 10 tons are carried daily on one four-wheeled "lurry" drawn by horses over paved roads at the crawling speed of about two miles per hour; durable steam vehicles will be built to transport as great or greater loads at more than twice this speed, and at about one-half the cost when this repressive clause is withdrawn.

Presumably the object of fixing a limiting tare is to provide against undue damage to the roads; but this would be better attained by making the total tire width a function of the gross load. It is not uncommon in Lancashire to find a gross of 12 tons on a total tire width of 18 in. (4 in. by 4½ in.), in addition to which the damage to road surface caused by the horses' hoofs has to be remembered; there is thus, neglecting altogether the latter consideration, 2⅓ ton per inch width of tire in these everyday cases.

Take now the extreme case of a steam vehicle having a 5-ton tare, carrying a useful load of 10 tons, and, with fuel and water, weighing a gross of 16½ tons; at the same rate as obtains in the Lancashire luries, a tire width of  $\frac{16\frac{1}{2}}{2\frac{1}{3}} = 25$  in., total, will be required, which may be obtained by making the leading wheel tires 5 in. wide and the driving tires 7½ in.

On the question of road damage, as Sir F. Bramwell points out in his paper read before the Oxford meeting in 1894, a House of Commons Committee so long ago as 1832 reported that "As steam vehicles admit of greater breadth of tire than other carriages, and as the roads are not acted on so injuriously as by the feet of horses in common draught, such carriages will cause less wear of roads than coaches drawn by horses."

Too much stress can hardly be laid on the necessity of building durable vehicles; it is certain that unless designed with generous proportions, excessive wear and tear soon takes place; in this connection it is useful to recall the experience gained by the Russians some years ago. The Messrs. Winans built some locomotives for the Czar, which were paid for by weight; in consequence it was jestingly said that these engines were cast whole, taken from the sand red-hot, water poured in boilers; sufficient steam being thus generated for the trial run. They were, of course, very heavy, and were, later on, displaced by others of lighter design. The sequel, however, is interesting. The lighter engines soon

went to pieces in the hands of Russian drivers; Messrs. Winans' old engines were replaced, and did excellent service during many years.

I trust you will excuse my dwelling so much upon this point of tare weight; but it is the one and only obstacle now remaining in the way of the complete solution of the problem, and that must be my justification.

The law allows each light locomotive to haul one trailing vehicle, their joint tare not exceeding 4 tons; and it might be thought that this would permit the successful transport of heavy loads.

Experience shows, however, that while this is the case, *per se*, manufacturers and merchants can rarely be found to view this method with favour owing to the difficulty anticipated in manoeuvring into and out of yards and wharves with a second vehicle; and their present attitude is strongly in favour of the whole load being borne by the motor-vehicle alone.

I proceed now to a brief description of some of the vehicles built to my designs during the past few years.

To begin at the beginning, a light steam-driven van was built in 1896, and designed to carry a useful load of 1 ton at a speed of from 8 to 12 miles per hour; the propelling machinery is in the fore part of the vehicle (the front wheels are the larger pair) and is chain-driven and front driving. The engines are a pair of small inverted vertical tandem compounds, having cylinders 2 in. and 4 in. in diameter by 3 in. stroke, and making about 500 revolutions per minute at a vehicle speed of 8 miles per hour. A machine-cut toothed pinion on the crankshaft engages with a spurwheel on a countershaft which, in its turn, rotates the driving wheels through a pair of block chains driven by suitable sprockets. The countershaft carries the usual differential or "jack-in-the-box" gear to facilitate steering.

The boiler is of the water-tube type, in which the water-tubes also form the firebars, and was designed for a very light launch boiler; the tubes are of solid-drawn steel ⅝ in. o.d.; the heating surface is about 50 square feet, and grate area about 2½ square feet. An air-condenser is fitted on the roof of the van; this is constructed of a series of thin copper tubes and weigh less than 2 cwt.; the cooling surface is about 130 square feet. Placed in this position, and concealed from view by the side boards, it occupies little room, and does not have the effect of making the vehicle appear bulky; under ordinary circumstances it condenses most of the exhaust steam from the engine. The safety valve discharges also into the condenser, which thus provides a silent and visible blow-off; this is a point of some importance in steam-driven vehicles plying in crowded thoroughfares.

The air condenser, of course, gives no vacuum; indeed, there is no doubt but that it increases, and, if not suitably arranged, very greatly increases, the back pressure of exhaust.

The condensed steam also is very often so contaminated with grease from the engine as to be unfit for boiler use. It introduces the further disadvantage of increased cost, weight, and complication, the latter both by reason of its own construction and of the additional piping and connections involved. It is doubtful whether these demerits do not more than outweigh the two nominal advantages its use confers, namely, less deposit of lime in the boiler, and the necessity of carrying a small feed tank only. There is the further, and undoubted, advantage of hot feed, but this is simply obtained otherwise by constructing the exhaust silencing vessel as a feed heater.

The condensed water drains from the condenser into a hotwell, and is thence re-delivered to the boiler by a feed pump driven from the engine shaft. To prevent any accumulation of pressure in the condenser from accidental causes, communication with the funnel is preserved through a connecting pipe.

(To be continued.)

## STOCKS' ATTEMPTED END-TO-END MOTOR-TRICYCLE RIDE.

MR. J. W. STOCKS, the old long-distance champion cyclist, commenced a ride from Land's End to John o' Groats on an Ariel motor-tricycle at 6 a.m. on Sunday last. The roads were in good condition between Land's End and Exeter, but when about seventy miles from the starting place the exhaust valve of the machine broke. It took Mr. Stocks fifty minutes to repair the damage, but he reached Exeter only twenty minutes behind the scheduled time. The distance from Exeter to Bristol was done in good time, the roads, though rather heavy, being dry. Tewkesbury (243 miles) was the next stoppage place, and thence, leaving at 6.30 p.m., or twenty-one minutes late, Mr. Stocks rode without halting to Warrington (358 miles), the distance being done in 19½ hours, which gives a very good average of 18½ miles an hour. Just before he entered Warrington rain began to fall, and he made a short stoppage, thinking that it would pass over. On the road to Preston rain came down very heavily, and he was compelled to shelter for more than two hours under a bridge. From that point to Kendal travelling was exceedingly difficult in a down-pour of rain, the roads being in a fearful condition. Mr. Stocks reached Kendal four hours behind the scheduled time, covered with mud, and at this point, owing to the state of the roads and the prospect of a bad ride to Shap, he relinquished the undertaking and returned to Birmingham on Monday. In view of the wretched weather conditions, we think that Mr. Stocks was wise in relinquishing the ride; the only wonder to us is that he stuck to it as long as he did, especially seeing that during the last eight hours it was raining heavily all the time.

\* Paper read before Section G of the British Association, Dover Meeting.

## MOTOR-CAR LICENCES.

A RETURN has just been issued by the Local Government Board of the amount received in each administrative county and county borough in England and Wales for local taxation, licence duties, and penalties under the Local Government Act of 1888 for the year ending March 31st last, from which it appears that the total amount received from all sources was £3,433,192 15s. 6d., and in addition to that £6,645 13s. 5d. was received in penalties. As may be imagined, the bulk of this amount was received from spirit licences, the amount being £1,372,034 19s. 1d. With regard to the Light Locomotives on Highways Act we find that the total amount received for locomotives under this Act was £112 7s., of which £15 15s. was received from the county boroughs and £96 12s. from the counties.

The following table will no doubt prove of interest to our readers, as it shows at a glance the amount received from each county and each county borough in England and Wales.

## TROUBLES OF A MOTOR-CAR INVENTOR.

At the Birmingham Police Court on Wednesday, John Thomas Wrides, Moseley Road, summoned Frederick Gilbert, carriage builder, John Bright Street, for assault. Mr. P. Baker, who prosecuted, stated that Wrides was the inventor of a motor-car which did not vibrate and did not cause a smell, and he instructed the defendant, who was a member of the firm of Gilbert & Sons, to build a "body" for it. He paid £40 as a deposit towards the cost of making. Plaintiff was in negotiation for the sale of his invention, but the prospective purchaser wished to make experiments before concluding the bargain. There was still a balance owing on the account, but that did not justify the defendant in assaulting Wrides when he desired to take the machine out to try it. Plaintiff stated that he removed the motor-car from the premises, and shortly afterwards, while travelling down the street, defendant and some of his workmen ran after him, mounted the car, and pulled him off, and the defendant struck him on the right temple. In cross-examination, plaintiff admitted that he had not finished paying for the work which defendant had done, and that at that moment he had a writ in his pocket which had been served upon him for the balance, £76 15s. Mr. Barradale: Did you ask any one's permission to take it away, or say you were about to take it? Plaintiff: I never thought it necessary. In answer to another question, plaintiff admitted that the morning he took the car out he had been requested to pay a further instalment. Plaintiff called a witness, who was not, however, able to speak to any assault being committed by defendant. Defendant denied that he struck plaintiff. The only occasion on which they came into contact was when plaintiff banged against him in trying to re-take possession of the car. The summons was dismissed.

## THE FATAL MOTOR-CAR ACCIDENT AT EDGE HILL.

(From Our Own Correspondent.)

At present the cause of the fatal motor-car accident at Edge Hill, near Kineton, is still unexplained. The accident occurred on Sunday, and resulted in the death of Nina McLeod, housekeeper, aged about forty-eight, and five others being injured. For several years Radway Grange, which lies at the foot of the hill, has been rented by Mr. Jamieson, and during the fortnight preceding the accident the Grange had been occupied by Mr. and Mrs. G. O. Haigh, relatives of Mr. Jamieson. A German Daimler motor-car was hired by Mr. Haigh from a motor-car company, and a man named George Breakwell was engaged as driver. On Sunday, Breakwell is understood to have obtained permission to take a party of the servants at the Grange out in the car. Five of these left the Grange in the car in addition to Breakwell the driver. These were Nina McLeod, housekeeper, and her niece, Maggie McLeod; Annie Ehrhardt, lady's maid to Mrs. Haigh; Thomas Rushworth, gardener; and George Metcalfe, butler. Avon Dassett was visited, and all seems to have gone well until the party had almost reached home. The car was seen descending Edge Hill, one of the steepest in the country, by some cyclists, who aver that it passed them at a rate of thirty or forty miles an hour, and that the women were screaming. At the foot of the hill the motor-car was stopped, and it is said the girls descended. About a quarter of a mile from there, however, the vehicle was shortly afterwards found in a hedge. All the occupants had been thrown out, and several of them were seriously injured. Metcalfe appears to have got off the lightest, and after doing what he could for the others he

opened the back of the car and put out the burning oil, having previously watched the driver start and stop the machine. The car had evidently been over and righted itself, as one side of the splash-board was broken, the lamp was bent, the front seat was twisted up, the hood of the back seat was out of place, and the tire was off the front wheel. The band of the running gear was also off the front wheel, and the pair of front wheels had jumped clear of their pivot. One side of the car was covered with mud.

Dr. Tenbon was hastily summoned from Kineton Church, and in the meantime the injured were removed to the Grange. Breakwell appeared to be the most seriously hurt. He had lost a great quantity of blood. It was found that his skull was fractured at the base, but his head was so cut that it was difficult to tell the extent of the fracture. Nina McLeod appeared to be suffering from shock, Rushworth was shaken, cut and bruised, the young woman Ehrhardt had a badly sprained shoulder, whilst Maggie McLeod was badly bruised.

Nina McLeod died during Sunday night.

The inquest was held at the Institute, Rodway, on Wednesday, before Mr. Theo. Christophers, coroner for South Warwickshire. Evidence was given that after coming down Edge Hill the driver took the car up again a part of the way and made a second descent. The bottom was reached in safety, but 500 yards further on the steering became erratic, with the result that the car twisted round, ran on to the turf, and then rolled over on its side. No explanation was given as to the real cause of the accident, and the inquiry was adjourned until October 13th, to allow of the attendance of the driver, who it is hoped will recover.

## FINED FOR FURIOUS DRIVING.

At Sleaford (Lincolnshire) Police Court, on Monday, Mr. J. W. Stocks, the well-known cyclist, was summoned for furiously riding a motor-cycle during the course of his recent twelve-hours ride. It was stated that defendant and two other record-breakers were riding at the rate of nearly twenty-five miles per hour. Defendant, who did not appear, was fined £3 and costs.

## TO CORRESPONDENTS.

All communications intended for insertion in this Journal or relating to Editorial matters should be addressed to THE EDITORIAL DEPARTMENT, MOTOR-CAR JOURNAL, 39 and 40 Shoe Lane, London, E.C. Letters must in all cases be accompanied by the name and address of the writer, as no notice will be taken of anonymous communications.

The Editors cannot undertake to return MSS. or drawings, although every effort will be made to do so in the case of rejected communications. Where such are regarded as of value, correspondents are requested to retain copies.

The Editors do not hold themselves responsible for the opinions expressed by their correspondents, or for statements and facts which do not appear in the editorial columns.

The Editors and Publishers beg also to state that they will accept no responsibility for unsolicited contributions, even if used, unless payment for same is directly specified in forwarding, and the terms arranged before publication.

To insure insertion communications and contributions must be in the Editors' hands by Wednesday forenoon of the week in which the same are intended to appear. Disappointment may be caused by non-compliance with this rule, and to avoid this earlier receipt, if possible, is necessary.

[No. 80.

Published Weekly by CORDINGLEY & CO., 39 & 40 Shoe Lane, London, E.C.

## COMMENTS.

MISS BACON's letter in another column will be read with a sigh of relief by those members of the Automobile Club who were beginning to fear the invasion of the fair sex into their cosy quarters in Whitehall. It is very clear that there is no organized attempt at intrusion, and Miss Bacon's discovery that ladies could not join the Automobile Club had a journalistic rather than a practical origin. Of course we are not opposed to ladies driving motor-vehicles, and our publisher welcomes their

adhesion to our subscribers' list. If Miss Bacon will read our "Comment" of last week again she will see that our attitude was not one of opposition to her proposal but of curiosity. What was the *raison d'être*? What would be done?—were questions as to which we awaited replies with interest. And those answers given in our "Correspondence" columns this week are re-assuring in their harmlessness. Who would be so ungallant as to debar the ladies studying the mechanism of the car or wandering about in workshops after working hours? One further point we would note: the preliminary meeting will not be held in the sanctum of the gentleman whose telegraphic address is "Vatican, London," but at 108 Cromwell Road, S.W., where Viscountess Harberton will probably endeavour to convert lady motorists to bloomers and rational dress. Really, the matter is developing alarmingly, and we hardly know what to do, in view of the procession of "blומר cyclists" who went to Reading last Saturday, headed by Lady Harberton, and startling all the farmers who were attending the market. A livery for motor men has already been discussed in our columns; perhaps the "Worlding" might be able to suggest something for motor women—if Miss Bacon has no objection. If the "rational dress" advocates get hold of lady motorists, such dresses as those in the above little sketch will be tabooed. What next?

### Modesty in American Calculations.

THE modesty of the Electric Vehicle Company of New York, New Jersey, and a number of other new places is so reassuring as to the character of Yankee automobilists that we almost feel inclined to withdraw our recent utterances concerning American bluff and give a donation to the fund which may shortly be started to find a George Washington among certain sections of the industrial world of the States. Here is the statement that thus causes us to reconsider our sceptical attitude of the past and wonder whether, after all, the Americans may not possess the virtues of modesty, humility, and general decorum in business:—"The Electric Vehicle Co. is rapidly preparing a system of urban and suburban service which at an early day will greatly lessen the usefulness of the horse. The first and most conspicuous extension of the automobile work will be in New Jersey. The Company now has 4,500 vehicles under construction for use in that State." Had the Electric Vehicle Co. claimed to have

4,555 vehicles under construction we might have cabled for confirmation of the news—but 4,500 is, of course, a different matter.

### Saving the Roads.

WRITING to a Chester journal that recently raised a query with regard to the Duke of Westminster's interest in automobilism, Mr. E. Shrapnell Smith has asserted that the damage done to the roads by mechanically-drawn carriages such as are now becoming familiar in this country is considerably less than that caused by the hoofs of horses. The point is, of course, quite commonplace to those who are acquainted with the subject, but it is one that cannot be too frequently demonstrated. If local authorities could be persuaded that such is actually the case, there should be little difficulty in obtaining their consent to improvements in making up, widening, straightening, etc., on the lines mentioned in these columns last week. The difference between the hoofs of a horse and the rubber of a tire should be apparent—even to a vestryman or other important person.

### "Motor-Car Accidents."

WHENEVER a horse bolts and ruthlessly turns its driver into a ditch on seeing a motor-car in the distance the newspapers promptly report a "motor-car accident." Near Ingatestone, in Essex, the other day a horse took right at a motor-car which was fifty yards away, with dire results to its driver. It never occurred to the enterprising reporter that this was a carriage accident; he at once set it down as a "motor-car accident," although the vehicle was never endangered and its occupants lent assistance to those who were hurt in consequence of the state of the horse's nerves. This may be a small matter to prejudiced people, but motorists strongly object to such disasters being labelled "automobile" without thought or reason.

### "The Coming Craze."

WHAT the *Daily Mail*, with questionable orthology, styles the "Coming Craze," is apparent to all moving in automobile circles. The various firms engaged in the motor-car industry of Coventry and elsewhere have orders on their books to carry them well over Christmas, even should orders cease to come in from the present time; but that this is not likely to be the case is proved by the many inquiries now being received by manufacturers. In many instances recently agents' demands have been limited by the supply, and the cry has gone up repeatedly for more cars—French or English. The finest barometer of the state of an industry is the Stock Exchange, and, as our readers no doubt are aware, since the change of directors the shares of the Daimler Company have steadily risen, until they now stand at 6½, while the British Motor Company's shares are also quoted. Some shareholders in the Motor Manufacturing Company, Ltd., too, have lately been offering to buy shares at a price that shows a considerable rise during the past few weeks. The Scotch Motor Company's

shares are also favourably looked upon; and therefore, with all these outside evidences of improvement in the industry, it is not unreasonable for us to expect the advent of a number of new companies. In many of these the share capital is being privately subscribed, in one instance the share capital amounting to £150,000. A new company, which will shortly be brought before the public, will have, we are informed, a capital of several hundred thousand pounds, while another company, shortly to be registered, will have as subscribers a number of the leading English automobilists. This latter company will be for the purpose of acquiring all the patent rights for this country of Messrs. De Dion and Bouton, and all machines imported by that firm will have to pass through the hands of the English concern. The number of manufacturers of motor-cars at present at work in Great Britain is small, but experiments are being made by several Northern engineering firms, with, in many instances, successful results. But with all the firms engaged at present and likely to be in a position to supply during 1900—including cycle firms making motor-tricycles—we are of opinion that it will be impossible to meet the demand that those who are in a position to know are assured will arise.

### Bumpy Roads and Loose Chains.

SATURDAY being a fine and bright day, one of our staff made up his mind to ride down in his car to Guildford for luncheon. As far as Kensington High Street all went well, but just by the shops the road was found to be "up."

There was no policeman on duty to divert the traffic, but observing a street on the left, and that the cabs going in our

THE PARIS-BOULOGNE RACE—LEVEGH ON MORS CAR ARRIVES AT "CONTROLE."

direction were turning down there, we followed. We may mention that some members of Lady Harberton's party, including Miss Bacon, on bicycles, were keeping pace behind us. These, with the exception of the lady mentioned above, adopted the sensible plan of dismounting, walking the seventy or eighty feet rather than risk the intricacies of a detour over unknown and shockingly macadamised roads. The turning we took, we soon found, branched in the wrong direction and brought us back on the high road again. Making inquiries, we found we ought to have turned to the right some considerable distance before the part where road repairs were in progress. Proceeding up Church Street, the turning in question, we soon got on the right road again. The wood pavement between Church Street and Addison Road is in a shocking condition, worse than the worst macadam, we should imagine, and in consequence one of our chains broke and became entangled. Half an hour's delay ensued, and the services of a cycle repairer were requisitioned for the purpose of obtaining a nut, for which the exorbitant charge of sixpence was made. Matters being adjusted, a fresh start was made, when off came the second chain. This being put right and

all hope of reaching Guildford for lunch being abandoned, the car was turned round with a view to its being taken back to the stable. But, alas! our troubles were not yet over, for we had not proceeded far on our homeward journey before the nut, which had been purchased for sixpence, broke, and off came the chain again. This was the "last straw," and proved too much for us, so leaving the car in charge of our man the services of a penny omnibus were utilised. And thus ended our Saturday's ride.

### An Unmerited Punishment.

We may mention that Miss Bacon has addressed to the writer an energetic protest at our leading her astray. For our mistake we are sorry and beg to tender that lady our sincere apologies—but, at the same time, we do not consider we deserve to be "stuck" on the rise up Church Street, a punishment Miss Bacon evidently considers "fits our crime."

### A Motor-Omnibus Service in London.

LONDON is at last to be provided with a motor-omnibus service, two vehicles having been inspected and licensed by the Hackney Carriage Inspector at Arbour Square Police Station on Saturday last. The vehicles are the property of the Motor Traction Company, Limited (late the London Steam Omnibus Company, Limited), and will commence running early next week between Kennington Gate and Victoria. The vehicles are already familiar to most of our readers, being similar to the one exhibited at the Agricultural Hall in July last by Messrs. Bayley's, Limited, Newington Causeway, S.E., and illustrated in our issue of July 7th. The motive power is supplied by a four-cylinder Daimler engine of 12 h.p., the vehicle having accommodation for twelve inside and fourteen outside passengers.

### One Result of Exceeding the Legal Speed.

As we pointed out in our last issue, one result of Goodwin's recent road record and the great speed attained by the motor-cycles and vehicle which paced him has been that the Chief Constable of Huntingdonshire has issued public warning to motor-car drivers, motor-cyclists, and cyclists to the effect that the police have received strict instructions to proceed against all who may furiously drive or ride their machines. One of our visitors at the office this week was Mr. Dan Albone, of Biggleswade, who reports that the police in that district are just now paying unusual attention to motor-cars, and that as a consequence of the recent scorching the county of Huntingdon is at present unsafe ground even for those automobilists who are content to travel within the limits of speed allowed by law. *The Motor-Car Journal* has all along been against automobilists travelling at excessive speeds, and we are not surprised at the action taken by the police. Unfortunately automobilists as a body are in the district named being made to suffer for the action of a few. Rapid as has been the progress made with motor-vehicles in this country, the movement has not yet developed to such an extent that those interested in it can treat the creation of a band of anti-automobilists with impunity.

### Practical Experience with the Stanley Steam Car.

AN American gentleman, Mr. H. P. Nottage, of Providence, R.I., who has purchased a Stanley steam car, sends an interesting letter to the *Horseless Age* anent this ingenious vehicle. The gentleman in question remarks that "the gasoline tank holds a little less than three gallons, and with this quantity of oil they (the Stanleys) can run the carriage seventy-five miles, but I have not heard of any one else who can do it yet. After having a carriage less than one week I find that I use about a gallon and a half of gasoline in sixteen

miles, and the water tank is then only one-quarter full. The automatic pressure regulator is set at 160 lb. I find that in speeds up to fifteen miles an hour the gauge holds steadily at 150 lb. on good roads. It seems to me that I am using fuel to get up 10 lb. of steam that I have no use for. On a run of seventy miles with one of Stanley's men, who handled the carriage very skilfully on muddy roads, and with occasional rain, we made the distance in four hours and fifty minutes (four hours actual running time). The water ran out at the end of the first thirty-three miles. We made twenty-one miles the first hour. Two and a half gallons of gasoline were taken in at thirty-six miles. Water and one gallon of gasoline were put in at sixty miles. We had, I should judge, a gallon and a half of gasoline left at the end of the trip. This was a new carriage right from the factory on its way to my home, and the run was made without a single adjustment, and with nothing done to the machinery except to oil up." The correspondent adds that "the carriage has not given a particle of trouble." The only complaint that he has to make is that he cannot run the vehicle so economically as the makers; and the object of his letter is to induce the makers to instruct users of Stanley cars "the way they do it."

#### The Speed of Cars.

At the meeting of the Worcester County Council this week the Earl of Coventry expressed the hope that the law should be enforced regulating the speed at which motor-cars should be allowed to proceed along the highways. He had recently received two complaints from his own neighbourhood in regard to the reckless speed at which motor-cars had been driven. In one case a team of horses became very much alarmed. The driver put up his hand to warn the man in charge of the motor-car to moderate his pace, but he took no notice. The chairman promised to bring the matter before the Standing Joint Committee with a view to a notice being issued by the police with reference to the rate at which motor-cars should be allowed to travel. So long as the police do not exceed their duties motor-carists will not complain, but we must protest against the idea which is sought to be instilled into the people in many districts, viz., that motor-car drivers are a most discourteous race. There may be instances, here and there, where drivers have not responded to the raising of the hand, as Lord Coventry says, but they must not be taken as typical of the whole class, who well compare in manners with the drivers of horses.

#### Parliamentary Automobilists.

THE Rt. Hon. A. J. Balfour, M.P., has become the possessor of a motor-tricycle, and while staying at Whittingham was to be seen on it careering up and down the long avenues which intersect his beautiful "policies." One cannot usually learn to ride a bicycle without getting an occasional spill, and the same holds good with a motor-tricycle. The First Lord of the Treasury is not exempt from spills any more than the average automobilist, and last week he came a graceful cropper while endeavouring to perfect himself in the art of motoring. Fortunately neither Mr. Balfour nor his machine were in any way damaged by their somewhat sudden contact with mother earth, nor is the honourable gentleman's enthusiasm in regard to things automobile in any way lessened by the occurrence.

#### Improve the Roads.

THE advent of the motor-car has revived interest in our roads in a very marked degree. Last week we referred to the *Spectator's* plea for reform; now the *Speaker*, another of the sedate six-penny weeklies, adds its voice to the demand for widening and improving our highways, and adds:—

"Mr. Chaplin might do worse than appoint a small Departmental Committee to consider the whole question, and especially to decide whether further powers should not be given to the County Councils for the widening of existing and the construction of new roads. At present no land can be taken compulsorily for the purpose of widening a road without a provisional order confirmed by Parliament. This is an absurd restriction, existing in no other country—not even in Ireland. The County Council should be able to take land at any time on paying fair compensation, and the compensation should be subject to an allowance for betterment. This is the real key to the problem of pace on the roads. Before the roads of England can be used for high-speed vehicles they must be widened."

Every owner of a motor-car has often been inconvenienced by the presence of traction engines in our narrow, winding lanes. We ourselves have had to back into a ditch in order to avoid collision, and doubtless many others have been similarly placed. The *Contract Journal* is the latest organ to denounce the existing road surfaces as bad, and motor-car owners in the rural districts can help the movement towards a better state of things by impressing upon local and other authorities the necessity of maintaining the surfaces in a good condition, while asking for powers to widen roadways where such action seems necessary.

#### Horses and Hooters.

A TEMPERATE letter from Mr. D. Cecil Gibbs in Wednesday's *Times* deplores the speed of motor-cars and suggests that none should travel more than "eight miles an hour for, say, the next two years, by which time horses will have had the opportunity of getting used to them." That, however, does not affect the ways of horses born when the

THE PARIS-BOULOGNE RACE.—THE HON. C. S. ROLLS ARRIVES AT "CONTROLE."

time limit has expired. We believe that many of the accidents that have been caused of late have been owing to the regulation which insists that some loud warning should be sounded whenever vehicles approach. It is not the sight of the motor-car that is so distressing to the horse, but rather the sound of the hooter. Often have we seen drivers of motor-cars pass by horses that have been unmoved, but which would never stand still when "the sound of the hooter was heard in the land." Since writing the foregoing a member of the Automobile Club has written to the *Times* in a similar strain.

#### The "Princess" Motor-Car.

WITH reference to the remarks by "Hercules" in Midland Motor Notes" last week regarding the Motor Manufacturing Co.'s "Princess" car, we learn that Mr. Iden drove the vehicle on Thursday last week from Coventry to London in just four hours, averaging 23½ miles per hour, with a consumption of only three gallons of petrol, and without changing water. Later on in the day the car went

to Maidstone and back without the slightest mishap occurring. In view of such good results we are not surprised to learn that the Company are booking orders for this type of vehicle very quickly.

### "Liquid Moonshine."

APPARENTLY the progress of the automobile industry in the United States is being hampered—we do not say hindered—by the persistency with which the company promoter lays bait for investors. Tired of wonderful and impossible assertions with regard to electrical and steam vehicles, he is now exploiting liquid air and motor-cars in combination, promising all sorts of advantages and every range of speed for the liquid air method. The production of liquid air is, however, the point upon which he is invariably silent or dismisses it with the mere assertion that that will be arranged as soon as the company is formed, etc. Liquid air, forsooth! Liquid moonshine is the better term, and so all this talk is rightly called by our New York motor-car contemporary.

### THE ROUXEL MOTOR-VOITURETTE.

THE "Rouxel" is the name given to the latest motor-voiturette to be brought before the notice of the automobile world, and an illustration of which is given herewith. The car, which is of French construction, being made by Messrs. Rouxel & Co., of Boulogne-sur-Seine, is being introduced into this country by Robertson's International Motor-Car Agency, of Woodstone, Peterborough. Seating accommodation for two persons is provided, but an additional seat can be arranged in front for a third person if desired. The motive power is supplied by a 2½-h.p. petroleum-spirit

motor of the "Aster" type, which has already been illustrated in this journal, the ignition being electrical and the cylinder cooling effected by means of radial ribs. The motor is geared to the rear road axle by spur wheels, a two-speed gear being provided. The car can, it is claimed, attain any desired speed up to twenty-five miles per hour, and will mount all but the most precipitous hills. Two hand brakes are provided. The body of the car is spring suspended, while the wheels are of the cycle type, shod with pneumatic tires. The weight of the little car, when fully equipped, is given as 7 cwt.

MR. CHAS. LEMI, of 570 High Road, Leytonstone, who in the early eighties was a well-known London cycle agent, is anxious to take up an agency for motor-cars. His premises are well adapted for the purpose.

### JOTTINGS BY A WORLDLING.

BACK again in badly-kept London! The qualification is a specific grumble against the misgovernment, one of the results of which is that almost every approach to one's house is "up" at the same time, and another that an officious policeman is allowed to disturb one's lunch by ringing the front-door bell and complaining to the butler that one's quadricycle is obstructing the traffic. The police down in my part of the world—Cromwell Road—take a childish delight in lodging this sort of frivolous complaint against any automobile, whereas it never occurs to them to "move on" the tradesmen's carts that stand driverless, with restless ponies, sometimes for as much as twenty minutes, outside our area gates—a constant source of danger to drivers of light cars.

I MET Mr. H. L. Doherty on what I call the lawn-tennis tricycle, as it was Count Voss's first, then poor Ernest Renshaw's, then the elder Doherty's, and is now the property of the "little Doe," as his friends affectionately call him. He told me that he had just ridden up from Eastbourne without any *contretemps* on the way. His brother, it appears, has bought a Comiot with De Dion motor, of course, 2½ h.p. He is well satisfied with it. Mr. "Billie" Barlow, another great lawn-tennis player, has joined our ranks, and is going to have a quadricycle built for him. He learnt to ride on the Croisette at Cannes this year, and his reckless *début* nearly cost him his neck—which, however, is unbreakable. By the way, in this connection I want to say a word for Mr. Eric Clift, of 51 Sinclair Road, near Olympia, our vet., as we call him. He does all our repairs for us—right well, too—and is at present building me a quadricycle with two-speed gear and other improvements.

IN an old Latin gradus I came across the following:—MORS, Monstrum horrendum, informe, ingens, *Bencius*. Thus did some Benz of the Middle Ages speak of Mors!

I HEAR that only two members of the Automobile Club have availed themselves of the special reduction of subscription at the Sheen House Club. Perhaps our chauffeurs funk the hill!

EVERYBODY should buy Vimar's "En Automobile," published by the proprietors of the *Figaro*. A story of the adventures of two English war correspondents on a motor-car in Matabeland, with such exciting incidents as the theft of the car by a troupe of monkeys (told with great wit, and illustrated with much skill and humour), it should be in every autocarist's library.

WE learn that Mr. Andrew Wallace Barr, a member of the Automobile Club committee, having been ordered abroad for the winter, is shortly proceeding to South Africa, where he will make an extended stay. In a letter to us Mr. Barr states that if he can be of service while there to any of his fellow members he will be pleased to so do. His address can always be had on application at 30 Moorgate Street, London, E.C.

I AM informed, writes our Midland Correspondent, that the driver of the motor-car which met with an accident at Edge Hill on Sunday week lies in a very critical condition. For some days after the accident he appeared to be progressing favourably, but he has suffered a relapse, and fears are entertained of his recovery.

## The "Empress" Motor-Voiturette.

THE accompanying illustration represents the "Empress" light motor-voiturette which is being introduced into this country by the United Motor Industries, of 3 Rue Meyerbeer, Paris. The car has accommodation for two persons, but an extra seat for one or two children can be fitted on the front if desired. The motive power is supplied by a De Dion motor of  $2\frac{1}{4}$  h.p. geared direct to the rear axle through the medium of a Didier two-speed gear. A friction clutch is also provided, so that the motor may be disconnected from the transmission at will. The Didier two-speed gear, which has already been described in this journal, has previously been fitted with success to quadricycles, and forms, with the De Dion-Bouton motor, one of the hill-climbing features. The friction clutch is worked by a pedal from the driver's seat, and the motor is thrown out of gear in order to slip in the high or low speed gear without noise or shock. The motor is started by a handle at the back of the car, and can be put completely out of gear, and regulated to run slow or fast by the carburation and advance sparking device; in fact, one of the advantages claimed for this car is that on going down hills the motor can be thrown entirely out of gear, the carriage being allowed to run of its own accord, so that if the motor has been working hard up a steep hill it can be stopped and so cooled on the run down. Powerful band brakes are fitted. All the trials of the car were successfully carried out with a  $1\frac{3}{4}$ -h.p. motor, and even with this power it was found that it would climb any hill 1 in 10 with heavy weights in the car with perfect ease. The carriage body, made by one of the best Parisian builders, is suspended upon easy C springs, and is stated to be absolutely free from vibration and shocks arising from uneven surface on roads. The wheels are of the cycle type, fitted with pneumatic tires.

### SCOTTISH NOTES.

#### Glasgow Autumn Holiday.

UNFORTUNATELY the weather was not of the best description on Monday last, the Glasgow autumn holiday. Nevertheless, undeterred by threatening meteorological aspects, many thousands set off by road, rail, and river to spend a short time "far from the madding crowd." For the road traffic all sorts of vehicles were brought into requisition, not the least important of which were the automobiles. On inquiry at the motor-car depot in Hamilton—the only place, by the way, in the West of Scotland where such machines can be hired out—I learned that every available car in the place had been booked. Some toil-worn Glaswegians thought fit to visit the classic Falls of Clyde and the ancient town of Lanark—always a popular route; others, more ambitious, had designs on "Tintock Tap," and enjoyed all the invigorating effects of a swift run across the heath-clad Douglas Moors; while "Straven toon," that land of cheese and gingerbread, claimed the attention of another section. The whole shire of Lanark was literally overrun on that day by horseless carriages, which, in the course of their winged flight, carried their loads of pleasure-seekers through scenery of varied nature. The longer distances which can be traversed by means of the motor-car, the freedom from all anxiety regarding the stabling or over-driving of horses, and the many other advantages which belong peculiarly to the motor-car are beginning to be recognised even by the one-day tripper, who, above all things, desires good value for his money. Despite the showery nature of the weather, which was much the same in the East as in the West, the Edinburgh Autocar Company were also very busy running passengers to various parts of Midlothian. The motor-car is decidedly catching on in the capital town, one of the surest signs of this being the amount of jealousy shown by the tramway company and other opposition camps.

THE MacLearn Automobile Co. has been incorporated in New Jersey with a capital of £20,000.

### Progress Among Jobmasters.

I WAS specially interested this week to hear that a member of one of the largest job and posting concerns in the East of Scotland had been touring through Perthshire during the past week in an automobile. I understand the firm are seriously thinking of adding motor-cars to their present large stock of horse-drawn vehicles in order to be up to date and cope with a demand which they anticipate they will soon have to meet or else loose custom. This is the sensible way of looking at the matter, and not "locking the stable door after the steed has been stolen," a policy which seems to be adopted by the majority of the carriage hirers of the country. The object of the gentleman indicated above in taking this tour was to thoroughly test the capabilities of the motor-car, and in the course of his journeying he came across some very stiff, long hills. The car behaved admirably, tackling them all in a business-like manner; and he expressed his satisfaction and surprise. Hills and motor-cars, in a great many quarters—especially horsey quarters—are synonymous with "sticks," and it is always specially pleasing when one can convince lovers of horse-flesh that the synonym is not a correct one.

### Parish Council Work.

THE Motherwell Parish Council officials have just paid a tribute to the efficacy of the horseless carriage. Last week they had a good deal of ground to go over visiting various hospitals and asylums within their jurisdiction. The inspections were all made within seven hours by means of a motor-carriage, and all were delighted with the rapidity with which their visits could be made. One official, at the conclusion of the day's work, said that the motor-car had done in seven hours what would have taken two horses and two days by the old-fashioned method. Slowly but surely people are beginning to recognize the fact that after all the motor-car has some good points in its favour.

### A Word to the Ungrateful.

GRATITUDE is not a remarkably common virtue, but it *does* exist. The fact, however, that gratitude exists in the bosom of a person who, as the result of a motor-car scare, had a trap worth £50 smashed and a horse valued at £100 rendered practically useless, is more extraordinary still, unless one considers it from the standpoint that the person involved was a "ladye faire," and, consequently, not so violently antagonistic to things automobile as some representatives of the sterner sex. But to the point. It happened in the Highlands. Four handsome young men, whose cheeks glowed with manly vigour and in whose eyes sparkled the joy of "motoring," were "whirring" merrily along the highway when in front they saw approaching a young lady in a phaeton, driving a very spirited horse. Immediately it caught sight of the motor-car it began to show all the signs of mad, unreasonable fright. Anticipating a bolt or spill of some sort the car was at once stopped and the chauffeurs went forward to render all the assistance in their power. The horse would not pass the motor, but stood dancing on its four legs, quivering with excitement. A gallant young medico, who formed one of the party, sprang to the animal's head to endeavour to coax it past and prevent it from bolting, thus enabling the lady to dismount and so possibly saving her from a nasty accident; but the horse was beyond his control, and with a wild dash it broke away, knocking him down in its mad haste, and inflicting a severe scalp wound and other contusions of a more or less serious character. The unfortunate young doctor lost a great deal of blood, and remained in an unconscious condition for some considerable time. The young lady, whose refractory horse had been the cause of all the trouble, at once sent off for a doctor, and insisted on the entire party coming up to her abode, a mansion house not far from the scene of the accident. A present of some game,

with the compliments of the sender and good wishes for a speedy recovery, was what the young sawbones received last week from the lady in question, in place of a summons to appear at a county-court to answer a charge of furiously driving a motor-car and so causing an accident. One might imagine he saw here the elements of a romance, but we have to deal with facts, and "fact are chieils that winna ding." Consequently we think this incident is a proof that gratitude does sometimes exist, and that all people who drive horses are not so utterly rabid in their hatred of automobiles as certain prosecutions south of the border would lead one to believe.

### The End of the Season.

WITH the close of September comes the end of the "tourist season" in the North and the "holiday time" everywhere. I am forcibly reminded of this by observing the announcements in the daily Press of the usual sales of Highland coach horses withdrawn from the various coaching routes throughout the country. So far as I have been able to ascertain from conversation with some of the more prominent coach owners, the season has been a particularly good one, although it was frankly admitted that until after the realization of their surplus horse-flesh at the forthcoming sales it was impossible for them to say on which side the balance of accounts would fall—whether debit or credit. I was a little surprised to learn that it was no uncommon experience after the "sales" for a proprietor to find that his "coaching accounts" for the season actually represented a loss, and but for the fact that the "coaches" are almost entirely in the hands of hotel proprietors who are in a position to make profit out of the "tourist" in other ways it would be impossible to continue to run these vehicles which form so pleasant a feature in a Highland holiday. It is, of course, well known that the coach proprietor, if he has to meet the public demand in his district, must purchase his horses at the time of the year when the price is highest, and he is forced to sell them again when the price is lowest.

### Motor-Coaches.

IN this I think there is a very strong argument in favour of the adoption of the mechanical vehicle for the work, and I am pleased to learn that not a few of those immediately interested are beginning to realise the possibility of making the "routes" pay, and pay well, by substituting the "motor" for the horse. I am emphatically of the opinion that the introduction of first-class motor-coaches in the first season of the new century would mark not only an important "new departure" but also a change for which the travelling public will be ripe.

### A Retrospect.

IT is impossible to shut our eyes to the strongly marked signs of the times. There have been more motor-carriages in private use throughout Scotland this summer than has ever been seen before. Who have been the users of these cars? Not a few enthusiastic faddists. They were a large number of sane people who were wealthy, influential, in fact, the leaders of "society," and many of them, nobility—royalty. No more need be said; the moral is plain: the year 1900 will mark an advance in the popularising of the motor-car of the highest importance, and which I dare to think will more truly entitle the beginning of the twentieth century to be called "motor year."

"BROWN HEATHER."

MESSRS. B. WEATHERLEY & SONS, of 261 High Street, Lewisham, are now stocking motor-car spirit. Moreover, they are in a position to undertake repairs to motor-cars and cycles.

## MIDLAND MOTOR NOTES.

By "HERCULES."

### The "Star" Motor-Car.

I HAD a chat last week with Mr. Lisle, manager of the motor department in connection with the Star Motor Co. and Star Cycle Co., Ltd., Wolverhampton, and I was surprised to find the establishment in such thorough working order. A large number of men are employed, and Mr. Lisle told me the Company were very busy executing orders for their 3-h.p. motor-cars, which are built on the Benz system. The productions of the firm are submitted to the most careful tests, and Mr. Lisle is frequently to be met on a trial trip. One day last week I was just in time to see him drive through the town with a full load—two others and himself—and witness the car ascend one of the steepest gradients in Wolverhampton—Lonsdale Road to wit. The ascent was made without a hitch of any kind. I was impressed with the neat and comfortable appearance of the vehicle, of which I hope to be able to give fuller particulars in a week or two. The firm, I may add, are also making motor-tricycles and "quads." These are very handsome in appearance, and are calculated to set one longing not only to possess such a machine, but for sufficient of "the wherewithal" to tour the country.

### Wolverhampton Automobilists.

MESSRS. CHILTON BROS., of the New Courier Cycle Works, Wolverhampton, are also makers of motor-tricycles and quadricycles. Mr. Chilton has become quite an enthusiastic motorist, and is frequently to be met riding with equal ease either a motor-tricycle or quadricycle. Though only a humble pedaller I hope to accompany Mr. Chilton on one of his trips, when I shall be in a better position to speak of the capabilities of the firm's productions. Mr. Parker, of the Electric Street Car Co., Ltd., Wednesfield Road, Wolverhampton, is another motorist frequently met with in Wolverhampton on his electric motor-car.

### A "Wearwell" Motor-Car.

THE Wearwell Cycle Co., Ltd., is the latest firm at Wolverhampton to enter upon the motor trade, and I am in a position to state that they have secured the services of one of the most experienced motor-car builders in the kingdom. The Company are laying themselves out to build a motor-car to retail at about £60, and are hoping to be able to have one finished in time to drive to London for exhibition at the National Show. They claim that not only will their motor-car be handsome in appearance, but that it will be thoroughly good and reliable in every way.

### On Tour with a "Decauville" Car.

MR. THOMAS FULLER TOOVEY, until recently intimately connected with the cycle trade in London, has been spending a few days at Wolverhampton and visiting some of his old cycling friends on his Decauville car. This has excited no little interest, and during the half hour he spent with me I should think that at least 400 people stopped to examine it. It is a very neat looking vehicle, and travels smoothly and swiftly. Mr. Toovey left Wolverhampton for Liverpool on Friday. His journey to Wolverhampton was *via* Maidenhead, the Thames Valley, Banbury, and Stratford-on-Avon, and he had one or two exciting incidents to relate. One of these occurred at Edge Hill, near Kineton, the day previous to the fatal accident to Miss McLeod reported in the last issue of *The Motor-Car Journal*. He considers the hill a most dangerous one, and that motorists cannot be too careful in descending it.

### Motor-Cars at Bournemouth.

WHILE in Bournemouth the other week I had a talk with a prominent resident there, and the conversation turned on motors. Visitors in that beautiful seaside resort have to depend on 'buses or cars, and I remarked that a motor-car service should prove a profitable investment. My friend agreed. During a week's stay at Bournemouth I saw only one motor, but the probability is that before long an enterprising person or company will see that a fine opening for a motor-car service is not lost.

### Ladies and Motor-Cars.

MOTOR riding is a fascinating pastime. A lady acquaintance of the writer's was once an enthusiastic cyclist, but since her husband had had the use of a motor-car she can hardly be persuaded to ride her bicycle. She often does her shopping with the aid of the car, and speaks in high terms of motoring. I shall not be surprised to see the lady driving the car herself one of these days.

### Motor-Cars and Newspaper Delivery.

THE uses of motors are manifold, and I hear that some newspaper proprietors in the Midlands have made enquiries with regard to the purchase of cars for the distribution of papers in outlying districts. At present trams or local train services have to be relied on, and they are not altogether satisfactory. A motor-car would certainly carry out the work with despatch, and the example set by several London papers will probably be adopted by their provincial contemporaries.

### Cycling Converts to Automobillism.

I NOTICE that Mr. John Urry, who purchased an Ariel motor-tricycle a few months ago, has another interesting chat about motors in last week's issue of *Bicycling News*, of which paper he is the editor. He describes the way in which he was "lectured" by an old and esteemed friend of his because he had taken to a motor-tricycle. The answer was given with such warmth that the candid friend went off "snorting like unto a wild jackass of the plain," and in high dudgeon. "Mr. F. J. Osmond is," states Mr. Urry, "very keen just now on a motor-tricycle, and has been fluttering around the Midlands on an 'Ariel.' He required no tuition, and manages the machine as though he had been used to it for years. There is no doubt about the fact that motor-riding possesses a charm which very quickly pervades a trier, and he is not satisfied till he possesses one of his own. It will be noticed how many of our old cycle riders are going in for motoring."

### Why Not Motor-Tricycles for Postmen?

A NEW development in postal deliveries is being tried at Grantham, where, in order to serve a group of villagers scattered over an area of several miles, the postal authorities have established a cycle post. A Coventry cycle firm was one of the very first to make carrier tricycles for rural postmen, to whom my sympathies have often gone out when I have met them on a windy day with quite a heavy load upon the tricycle, shod with solid tires. Some day, perhaps, the motor-tricycle may supersede these tricycles. Their superior advantages cannot be over-estimated. Time and labour would be saved, and the early despatch or collection of letters and parcels would be greatly appreciated. Telegraph messengers are now being mounted with bicycles all over the country, and the great advantages of motor-vehicles will probably dawn before long upon the official mind. Some day we shall doubtless regard the rural letter carrier's tricycle and horse-driven mail-cart for the collection of letters and parcels as antiquated.

**Motor-Tricycle Races.**

**SPEEDY** professional cyclists have had few opportunities during the present season for displaying their powers on English racing tracks, and one is not at all surprised at the favourable disposition which a number of the speediest men show towards motor cycling. The sport has met with the approbation of the public, and every additional race demonstrates its popularity. It is rumoured that Arthur Chase is about to take to motor racing and will enter for some of the big contests on the Continent. I know Chase has had some experience in motors, and there is no reason why he should not be equally successful with the "new love" as with the old. Something was wanted to revive the enthusiasm which cycling races at one time evoked, and that something has been forthcoming in the introduction of racing on motors. It had been thought that we had reached finality with regard to the speed which could be attained on a cycle on a racing track, but motor pacing has shown that speed possibilities have not yet been exhausted. Motor-tricycles have shown still greater speed powers, the times of the fastest cyclist have been easily eclipsed, and it is impossible to tell what the future may have in store. Next season is bound to produce some sensations in this direction. Many of the larger and older makers are devoting a good deal of attention to turning out motor-tricycles which will possess still greater speed powers than their productions hitherto have shown. Nor will they rest content until they have proved to the world that English-made motors can successfully compete with those on the Continent.

**See to Your Lamps!**

**STILL** another instance of the difficulty of obtaining petrol was given at the Coventry Police-Court on Friday. An engineer named Edgar Hayes, of Coventry, was summoned by the county police for driving a motor-car at Ryton-on-Dunsmore after one hour from sunset without having a light attached. Hayes admitted the offence, and told the magistrate that he had been sent by the Humber Co. to Watford to fetch a motor-quadracycle. He was delayed on the way through not having sufficient oil, and though he tried to get oil at Dunchurch he was not successful. Nor would any one lend him a lamp, so he had to drive the remainder of the distance without a light. He was coming slowly and cautiously when he was stopped by a police-officer. The chairman (Col. Woolcombe-Adams) said Hayes ought to have had a lamp with him when he started with the motor, and thus have been prepared for a breakdown. Motors, he added, were dangerous things without a light, and an accident might easily have been caused. A fine of 5s. and costs was imposed. Drivers will do well to see that their lamps are "well trimmed" and on their vehicles when they start on a long journey, but in this case the driver was hardly to blame, seeing that he received the vehicle at Watford. It would be as well, too, to see that the bye-law as to carrying lights was enforced generally, for motorists run considerable risk through other vehicles neglecting to comply with the bye-law, and even in that portion of the county of Warwick which abuts on Coventry.

**The Accles-Turrell Car.**

**ONE** of the most promising of motor-firms is the Accles-Turrell, of Holford Works, Perry Bar, Birmingham. They have recently turned out a car which the writer expects will make a mild sensation in the motor world, and for which he predicts a keen demand when its virtues and capabilities are known. The car has been designed by Mr. C. McR. Turrell, who was chief engineer to the British Motor Co., Ltd., and who has been connected with the industry since its introduction to this country. The car under notice is the outcome of about four years' thought and experience, and the inventor's chief aim has been to produce a car which shall be

simple, effective, and easy of manipulation for those who have little mechanical knowledge of motors. Mr. Turrell has succeeded in his aim in a marked degree, the engine on this car having been reduced to a very simple form. The car is provided with three speeds and a reverse motion, which can be altered with scarcely any perceptible movement. The mechanism for steering purposes, also that which controls the change of speed, as well as the motor control, is compact, within easy reach of the driver, and quite out of the way of the friend he may have with him. The brakes are very powerful, and the car can be stopped on stiff inclines or in a very short distance on the level. There is quite an absence of grease and lubricators about the car. Nothing upsets a lady more than to have her dainty costume besmeared with dirty grease, and there is no danger of that accident upon Mr. Turrell's car, which is neat and pretty in design. It has a long wheel base to ensure safety, and there is quite an absence of smell. The noise of the car is but slight. When the writer accompanied Mr. Turrell upon a short trip on the car he was somewhat out of sorts, and did not feel equal to much jolting; he was, however, agreeably surprised at the smoothness of the running. During the past ten days Mr. Turrell has run the car an average of fifty miles a day, and during the whole of the journeys there has not been a semblance of a breakdown. He contemplates an early journey to London. The car is made to seat two persons, its wheels are shod with pneumatic tires, and it is capable of negotiating any hill which can be surmounted by a horse and cart. Stoneleigh, the stiffest hill in the neighbourhood of Coventry, has been mounted, and when half way up the car was stopped and started again. This was a severe test, but the car came out of it with flying colours. Mr. Turrell has undoubtedly hit upon a motor which will serve the public well. The price is moderate, the car's capabilities are excellent, and I predict a keen demand for it.

**THE CANFORD CLIFFS MOTOR-OMNIBUS.**

**THE** accompanying illustration represents a motor-omnibus recently completed by the Motor Manufacturing Co., Ltd., to the order of the Canford Cliffs Motor-Omnibus Syndicate. The 'bus, which is fitted with a 5½-h.p. Daimler motor and provided with four forward speeds and reversing gear, is made to carry eight persons. When purchasing the vehicle the Syndicate stipulated that it was to carry a full load up a gradient of 1 in 9, and we learn

that it fulfilled these requirements with perfect ease on Saturday last, to the great satisfaction of the purchasers. It is the intention of the Syndicate to run the 'bus from the centre of Bournemouth to the Canford Cliffs Estate with the idea of developing this property, and it will be interesting to hear in a few months time what success has attended their efforts. Undoubtedly there is a very large field for motor-vehicles for work of this description.

# THE BERLIN INTERNATIONAL MOTOR-CAR EXHIBITION.

(Concluded from page 463).

THE section devoted to petroleum spirit cars is, as might be expected, the largest, a number of well-known firms being represented. Messrs. Benz & Co., of Mannheim, make an extensive display, their cars being too well known to need any lengthy description at this time. We may mention, however, that their exhibit comprises vehicles capable of seating from two up to twenty persons. A novel type of three-wheeled two-seated car is shown by the Patent Motorwagen-fabrik "Rapid," of Zurich. The car resembles in its general outlines the well-known Bollée voiturette, from which it, however, differs both as regards the mechanical details and

FIG. 1.—THE DE DIETRICH PETIT DUC.

the body. The motor is of the horizontal, single cylinder type, of  $3\frac{1}{2}$  h.p., and is provided with a water-jacket and electric ignition. Its position, low down in the centre of the vehicle between the three wheels, gives the car great stability, and totally overcomes, it is claimed, the tendency to side-slip. The transmission of the power and the speed variation are obtained by means of a single belt and a set of spur wheels, and are arranged to give two main speeds of eight and twenty miles per hour, all intermediate speeds being obtained by regulating the electric ignition and the supply of explosive mixture. The seat is well suspended on carriage springs. The wheels are of the cycle type, fitted with pneumatic tires, the weight of the car complete being about  $4\frac{1}{2}$  cwts.

The Daimler Motoren Gesellschaft, of Cannstatt, are present with a number of vehicles built on the well-known Daimler system, prominent among them being a victoria with an unusually long wheel base. A German-built Decauville car, amongst others, is shown by the Eisenach Fahrzeugfabrik, of Eisenach.

A large display is made of the well-known Amedée Bollée cars by Messrs. De Dietrich & Co., of Niederbronn, Alsace, the vehicles on view ranging from a phaeton to a large family omnibus. As we described and illustrated this type of vehicle in our issue of April 14th last, further reference at the present time is unnecessary; we give, however, in Fig. 1 an illustration of the three-seated petit duc, which is fitted with either a 6 or 9-h.p. motor as desired.

The Bielefelder Maschinenfabrik vormals Durkopp and Co., of Bielefeld, exhibits a number of motor-cars built on the Canello-Durkopp system (Fig. 2). The motor and transmission gear in these vehicles has many points of resemblance with the Panhard-Daimler cars, yet at the same time presents several special features, to which we hope to refer at length in a later issue.

The Kühlstein Wagenbau, of Charlottenburg, exhibits a number of vehicles including the Kühlstein-Vollmer tractor illustrated and described in our issue of August 4th last. This concern is also now building rear-driven petrol cars, the "duc" shown at the exhibition being of a neat design.

The Opel motor-carriages are shown in a variety of styles by Herr Adam Opel, of the Nähmaschinen und Fahrräderfabrik, Russelsheim. These cars are on Benz lines, but built to the designs of Herr Lutzmann, whose business was some time ago acquired by Herr Opel.

A novel form of light two-seated voiturette is shown by the Gesellschaft für Automobil-Wagenbau (system Loutscky), 49 Französischestrasse, Berlin, W. The motor is located at the rear part of the vehicle, while the front wheels are carried in forks similar to those employed in a bicycle. We hope to illustrate this vehicle in an early issue.

M. Leon Lefebvre, of Paris, exhibits the "Bolide" racing car with which records have been created in France.

A very neat type of three-seated motor-carriage, very much on the lines of the Rumpf car illustrated in our issue of August 11th last, is shown by the Schweizerische Motorwagenfabrik, of Wetzikon, Zurich. As the car possesses several interesting features we defer a lengthy notice of it until we can publish illustrations.

The Belgian exhibits include the electro-petrol car of the Etablissements Pieper, of Liège, and the voiturettes of the Fabrique Nationale d'Armes de Guerre, of Liège, and of the Ateliers Dechamps, of Brussels, all of which have already been described in this journal. Petroleum-spirit motor-cars are also shown by the Berliner Maschinenfabrik (Henschel and Co.), 97 Schillerstr., Charlottenburg; the Centaur Automobilbau Gesellschaft, 33 Helmholtzstrasse, Charlottenburg; the Falke Fahrzeugfabrik, of M.-Gladbach, Rhenish Prussia; Herr A. Klose, 1 Universitätsstrasse, Berlin, N.W. (Peugeot); Herr Hugo Mayer, of 54 Kurfürstendamm, Berlin (the Victoria Combination and a new light three-seated car); the Motorfahrzeug und Motorenfabrik Berlin Gesellschaft, of Marienfelde (German Daimler cars); the Vulcan Automobil Gesellschaft, Berlin; and the Motorkutscherei der Allgemeinen Motorwagen Gesellschaft, 37 Luisenstrasse, Berlin, N.W. (German Daimler cars).

Motor-tricycles and quadricycles are shown by quite a number of firms, including the Adler Fahrrad Werke (Kleyer), of Frankfurt-am-Main; the Berliner Maschinenfabrik (Henschel & Co.); Messrs. Cudell & Co., of Aix la Chapelle, who hold the licence for De Dion motors and tricycles in Germany; the Eisenach Fahrzeugfabrik; the Gesellschaft für Automobilwagenbau, Berlin; Messrs. Hartzendorff & Lehmann, 176 Köpenickstr., Berlin; Herr Moritz Hille, of Löbtau, Dresden; Herr Hugo Mayer, of Berlin; Messrs. Heinle & Wegelin, of Oberhausen, near

FIG. 2.—THE CANELLO-DURKOPP CAR.

Augsburg; the Pfälzische Nähmaschinen und Fahrräderfabrik (Kayser), of Kaiserslautern; Messrs. Stoeber, of Stettin; Messrs. Weyersberg, Kirschbaum & Co., Solingen; Herr Carl Wunderlich, 20 Besselstr., Berlin, S.W.; Messrs. Antoine Fils & Co., of Liège; Messrs. Marot, Gardon & Co., of 37 Rue de Brunel, Paris; Messrs. Noé Boyer & Co., Paris (Phébus motor-tricycles).

Herr P. Schauer, of 21 Sebastianstr., Berlin, S., exhibits a new motor-bicycle in which the motor is mounted on an

additional pair of front forks. The Pernoo motor-bicycle, of the Société Industrielle et Commerciale de Fabricants des Cycles, of 114 Rue Oberkampf, Paris, and the Werner motor-bicycle of Messrs. Werner Frères & Co., of 40 Avenue de la Grande Armée, Paris, are also on view.

## MOTOR-CARS ON THE CONTINENT.

(From Our Own Correspondent.)

### The Paris-Madrid Record.

It is announced that early next month M. Enrique Marzo, a well-known officer in the Spanish Army, will endeavour to beat the record Paris-Madrid, now standing to the credit of MM. Edouard de Perrodil and Henri Farman. This existing record was made "à bicyclette," and as the would-be record breaker intends to ride a motor-cycle, and will be paced by Béconnais, Osmond, and Duanip, he should be successful in his attempt.

### The Automobile Club of Nice.

AFTER the "A.C.F." probably the most important Automobile Club in France is that at Nice, the members of which can between them muster no less than ninety cars. Towards the end of November this Club will be installed in its new house on the Promenade des Anglais, and there the members will find every luxury and convenience. Ample space for the storage of fifty automobiles will be afforded in the new premises. All English automobilists visiting the Riviera should certainly become members.

### The Bordeaux-Biarritz Race—The Hon. C. S. Rolls a Competitor.

INCREASED interest is centred on the Bordeaux-Biarritz race which is to be run off on Saturday and Sunday next by reason of the fact that the Hon. C. S. Rolls is one of the entrants in the touring class. Mr. Rolls will be accompanied by Mr. Millership, Mr. Staplee Firth, and another gentleman. M. Etienne Giraud, who drove a 20-h.p. Bollée in "Le Tour de France," will be contesting in the racers' section, mounted on a 12-h.p. Panhard car. In the list of entries the horse-power of M. Lemaitre's car is not quoted. Is it to be the new 52-h.p. Peugeot? We wonder!

### Béconnais' Recent Performances.

THE sensation of the week has been the marvellous times achieved by Béconnais riding a Phébus tricycle fitted with an Aster motor developing  $4\frac{1}{2}$  h.p. His speed trials were carried out on the "route du Parc Agricole d'Achéres," the road on which took place the famous struggles of MM. Jenatzy and Chasseloup-Laubat, and the route to which all would-be record men betake themselves. At his first attempt Béconnais made a clean sweep of the existing motor-cycle records for one or two kilometres, his times being: 2 kilometres, 1 m. 50 $\frac{3}{4}$  s.; 1 kilometre (flying start), 49 $\frac{1}{4}$  s., as against the old figures of 1 m. 57 $\frac{3}{4}$  s. and 55 $\frac{1}{4}$  s. respectively. Not satisfied, Béconnais made another trial, and succeeded in reducing his time for the kilometre with flying start to 48 s.—that is, a speed of 75 kilometres or 47 miles per hour. It will be remembered that M. Jenatzy, driving his electric car, "La Jamais Contente," made the kilometre under the same conditions in 32 s. This represents a speed of nearly 106 kilometres (66 miles) per hour. Following up this performance on the road, Béconnais on Sunday last, at the Parc des Princes, rode 34 kilometres in 30 m. 41 s., and then was compelled to stop on account of a punctured tire. He proposes to continue his trials, as he wishes to be the first motor-cyclist to cover 70 kilometres within the hour.

### Motor-Cycle Races in Paris.

ON Sunday last a 20-kilometres race for motor-tricycles was run off at the Park des Princes track in Paris. The winner, Barras, covered the distance in 19 m. 20 s., that is to say, at an average speed of about 62 kil. an hour. The second was Gasté and the third Merville, who had on his tricycle a double motor of the "Sphinx" type. Béconnais took the lead and kept it during the first 10 kilometres, when Barras joined him. Béconnais tried to keep up, but his motor seemed to run badly, and he finally left off. Barras and Gasté were riding special De Dion motors fitted with the new "Buchet culasse," which seems to be an improvement for high-speed tricycles.

### A Novel Motor-Cycle Race.

OUR French contemporary, *La Vie au Grand Air*, which has initiated several automobile races this season, announces the organization of a course for motor-cycles in which the competitors will race *sans* chain and pedals. This will have the effect of placing the ordinary chauffeur on an equal footing with the chauffeur-cyclist, who frequently wins races on account of his greater stamina and pedalling powers.

### The Berlin-Leipzig Race.

ON the 20th instant the second course organized under the patronage of the Committee of the Berlin Exhibition was successfully decided, in spite of the somewhat inclement weather. The departure of the sixteen competitors was effected at Marienfelde, some fourteen kilometres out of Berlin. M. Branda, the winner of the Berlin-Baumgartenbrück race, held the lead for a time, but the first four arrivals at Leipzig were:—1, Held (car); 2, Pittelkow (motor-cycle); 3, Türkheim (car); 4, Dietrich (car). The winner covered the 185 kilometres at an average speed of 35 kilometres per hour.

### The Competitions for Voiturettes.

REALISING that the general public know but very little as to the capabilities of the many types of small cars which are now being constructed in France, our contemporary, *Sport Universel Illustré*, is organizing a fete and competition for October 18th and 19th which will be entirely reserved for this class of automobile. Of course, there are several very excellent small cars now in use, but taken as a class the voiturettes are lamentably behind their larger brethren, both as regards appearance and reliability. The programme, as announced by our contemporary, consists of two parts, the first technical and the second fanciful. On the first day there will take place:—1. Steering competition for petrol voiturettes carrying two persons side by side and not exceeding £200 catalogue price. 2. Competition for "voiturettes-voitures" of a catalogue price between £200 and £320. These vehicles must be piloted by ladies or children, and the competition will consist of driving among a number of obstacles at a minimum speed of  $7\frac{1}{2}$  miles per hour. The course will be three circuits of the "rond-point des tribunes" at Longchamp. The cars must also be decorated. 3. Gymkhana, open to petrol motor tricycles, quadricycles, and bicycles. 4. Costume competition for automobilists. On the second day there will be decided a race to Rambouillet and back, the competing cars being classified as follows:—1. Petrol voiturettes, two places side by side, price £200 or less: (a) 2 h.p., (b) exceeding 2 h.p., (c) exceeding 3 h.p. 2. Petrol voiturettes-voitures, price £200-£320. Diplomas will be awarded to all cars making the journey at an average speed of  $7\frac{1}{2}$  miles per hour. We shall await the results of these tests with interest.

**Motor-Cycle Race for the Championship of Europe.**

ON the occasion of their 100-kilometres bicycle championship, the Cycling Union of Switzerland have organized, under the somewhat ambitious title of "Le Championnat d'Europe," a 20-kilometres race for motor-cycles. This race will take place on Sunday next, but it is hardly likely to command an entry representative of the leading chauffeurs.

**A New Motor-Bicycle.**

ONE of the most recent types of this class of automobile is the Sanciome machine. The motor, which consumes petrol as the fuel and develops about 1 h.p., is of the single-cylinder type working on the Otto cycle. It is supplied with the ribs peculiar to air-cooled engines, and is fitted with electric ignition. It weighs 9 kilos. 400 gr., and is attached to the lower cross tube of a diamond frame bicycle, the top and back tubes of which carry respectively the petrol tank and the electric battery and coil. Complete, the cycle weighs about 28 kilos., and is said to be capable of running up to a speed of twenty miles per hour on the level.

**Paris-Ostend Prizes.**

THE official list of prize-winners has now been published, and we note that the "dead-heaters," MM. Levegh and Girardot, each take a sum of £150. Baras, who was first in the motor-cycle category, is awarded £60. To the several winners in the tourists' class medals are presented.

**Motor-Cars in Russia.**

THE automobile has now penetrated the realms of the Czar, a few of these vehicles now careering about St. Petersburg. So far only twenty-one permits have been issued, and before these were granted the drivers of the cars had to pass an examination whilst the vehicle was being closely inspected. The speed is limited to twelve versts—about eight miles—an hour, with the proviso that the vehicles must emit neither smoke nor steam.

EDWARD HAYES, engineer, was last week fined 5s. and costs for driving a motor-car without a light at Rayton-on-Dunsmore, near Coventry.

A MOTOR-CAR has been placed on the route to Villette Road, Sunderland, by way of Toward Road, in response to recent appeals in the press.

WE learn that Mr. Henry J. Swindley has been appointed by the Committee of the Automobile Club, and has consented to serve, as honorary timekeeper to the Club.

HERR VON PODBIELSKI, the German Secretary of State, Herr G. Daimler of Canstatt, and Herr Benz of Mannheim have been elected honorary members of the Mid-European Motor-Car Club.

MESSRS. JULIUS HARVEY & Co. have issued a new catalogue of steam, oil, and electric motor-carriages, cars, and vans for passengers and goods. It is capitally got up, and should materially assist the development of their business.

MESSRS. HEWETSONS, LTD., send us a copy of a letter received from Messrs. Benz & Co., of Mannheim, regarding the success of the Benz cars in the races recently organized by the authorities of the Berlin Motor-Car Exhibition. In the Berlin-Baumgartenbrück race (65 kilometres) an Ideal car secured the first prize in the voiturette class, while in the Berlin-Leipzig race (190 kilometres) Messrs. Benz entered for the first time a special racing car, and the firm are naturally elated at the success they achieved in carrying off the first prize.

**CORRESPONDENCE.**

**INFORMATION WANTED.**

TO THE EDITOR OF *The Motor-Car Journal*.

SIR,—I wonder if your correspondent, "Brown Heather," will be able to throw any light on a motor-car that I saw lately near Strathpeffer. I met it at a bend of the road a few miles to the west of Strathpeffer. It was going at a good smart pace, fully ten miles an hour. At first I thought it would be a car plying for hire, one or two of which I had previously seen in the district; but after it had passed me I noticed that it had a hood (down at the time) like that of a landau or Victoria, and I inferred that it would be a private conveyance. It had somewhat the appearance of the Verkehrsunternehmen Company's electrical droschke, Fig. 3, page 463 of your last publication, or of the Krieger Victoria, Fig. 1, page 449, though the driver or conductor of the machine did not appear to be so high-seated as in the latter.

The driver or conductor was alone on the front seat, and there were two ladies in the carriage, facing to the front.

It seemed quite such a car as I have been on the look-out for, and I should like to know more about it, particularly whether it was driven by electricity or oil, and if by electricity (as I rather think it was) how far it can go from a charging station. That there are so few places where one can get a fresh supply of electricity seems the great drawback at present to electrical cars, which otherwise I would prefer; and I should like a car capable of going fifty miles from a charging station, and of course to return, which means 100 miles in all.

Edinburgh, I am, yours truly,  
September 25th, 1899. J. R.

**LADIES AND AUTOMOBILISM.**

TO THE EDITOR OF *The Motor-Car Journal*.

SIR,—In relation to your paragraph concerning "Ladies and the Automobile Club," I would like to draw your attention to the following points:—

I do not think any "organized band of lady motorists" would care to intrude upon the privacy of the members of the Automobile Club, or any other gentlemen similarly placed. It was merely by accident I discovered that lady motorists were not permitted to join the Club. Whilst engaged in writing an article for one of the monthly periodicals on "Motoring as a Pastime," I naturally sought to include particulars of the Club's arrangements, and on writing to the secretary was furnished with the rules and regulations, from which I gathered that as ladies were not admitted to membership there was room for a ladies' club.

As you will see, my endeavours to interest myself and others in the fascinating pastime of motoring were very innocent. Apart from being "obtrusive," I merely wished to educate myself in order that in the future I might read with more intelligence and pleasure your columns. Surely you do not exclude ladies from your subscribers' lists!

It cannot be that you are opposed to ladies driving motor-vehicles, for it was through the courtesy of the Motor Manufacturing and Beeston Companies that I was taught and allowed to drive the motor-tricycle in the Old Deer Park, Richmond Park, and along the Warwickshire roads. Indeed, I owe my "motor mania," as it may be styled by some who are still so much behind the times as to oppose the coming mode of locomotion, to the kindness I received at the hands of the various companies and members of the Automobile Club.

I have not one word to say against the Club or its management. The Club itself may be closed to women, yet many of its leading members have proved themselves to be not only chivalrous but generous to ladies interested in the automobile. It was through the kindness of Mr. J. K. Starley that I was enabled to study the mechanism of, and

drive for some four hours daily in the environs of Coventry, the Benz car. I was also permitted to bring it to London, for I believe such practical experience in driving is essential to any one who desires eventually to become a motorist.

The question resolves itself to this: Are there a sufficient number of ladies interested in motors and motoring for the formation of a club? If there are not now there will be in the future, and as there is so much foundation work to be done the sooner a beginning is made the better it will be for all parties concerned.

I find myself in this position: Having learnt in a superficial manner to drive motor-vehicles, how can I study the mechanism of the cycle or car I wish to drive sufficiently to be able to detect errors of adjustment or construction in case of breakdown? The workshops are closed to ladies, but if there were a number of women desirous of such mechanical education a class might be formed and lectures given on the construction of motor-vehicles, with opportunities for practical tuition in the workshops after the working hours of the staff. Provided ladies could pay for such instruction, where is the objection to their having it? Whether or not ladies will prove themselves to be incapable of becoming competent motorists remains to be seen. If any lady finds herself able to understand the mechanism of the vehicle she drives sufficiently to be able to be wholly responsible for its care the motor industry will find itself in a stronger position and the popularisation of the automobile will be nearer to hand than it is at present.

You ask, "Why should Mr. Stead's sanctum be chosen as the rendezvous for lady motorists?" Simply because, not having any other room offered me, I accepted the kind permission to use his; but it is proposed that the preliminary meeting will be held at 108 Cromwell Road, S.W., which is the town residence of the Viscountess Harberton, whose drawing room is capable of holding some hundred people.

Mowbray House, Norfolk Street, Yours sincerely,  
Strand, London, N. G. BACON.  
September 25th, 1899.

#### THE CINEMATOGRAPH ON TOUR BY MOTOR-CAR.

TO THE EDITOR OF *The Motor-Car Journal*.

SIR,—Oh, such weather—rain, storm, and blast every day! But the fixtures of a touring entertainer admit of no postponement or delay, and must be fulfilled despite the vagaries of Jupiter, Pluvius, Boreas, and the elements in general. Flookburgh, near Holker Hall (which was the favourite residence of the late Duke of Devonshire), was our first stop after Staveley, and the journey of about twenty-one miles was accomplished in weather that is generally termed only fit for dogs. We would not be denied, and after unloading at the Hall motored on to Cark and Cartmel to let the people know that not only had the first motor-car arrived but also that the first cinematograph had come to town. The result repaid our efforts for the village hall that night, was full to repletion. Thence the next day to Arncliffe via Grange-over-Sands, with a splendid view of the angry seas in Morecambe Bay, which owing to the autumnal equinox and the spring tide were magnificent in their grandeur. The following day to Caton, via Milnthorpe and Lancaster in a drenching and bitterly cold rain-storm every inch of the journey, about twenty-five miles, and on arrival the car was bemattered with mud from end to end.

Glad we were that Caton was a two-night "stand," for it gave us an opportunity to clean up the car and make ourselves spick and span for the next week's route. I notice in your last issue an account of Mr. J. W. Stocks' attempted ride from Land's End to John o' Groat's, and we certainly must have met him. *En route* from Greenodd to Staveley, Windermere, we motored via Kendal, and pulling up in a side street there we let off the pressure for a little while until we made one or two necessary purchases in the "K" boot

town, and just as we were returning to our car to proceed we noticed a motor-tricycle flash by. Yes, "flash" is the word, for it was going splendidly. The rider looked somewhat travel-stained, and no wonder, for the roads were fearful. We experienced a little regret that he did not stop for a second to speak our car, but as it was undoubtedly Mr. Stocks competing against time I can now thoroughly understand it. We admired the splendid manner in which the tricycle mounted the hill leading to the bridge, which, with our load, we were compelled to do at a much more sober pace. The weather that stopped Mr. Stocks is what we have had to put up with day after day, and judging from our rosy faces I think it must agree with us. From Caton to Bentham, only eleven miles—still raining!—and to-day, Bentham to Ingleton—as bad as ever, cold wind, biting rain, and hail. The road, although only four miles, is quite a switchback, and with nasty gutters caused by the rain here and there. At Ingleton we hear that several cars from Leeds and Bradford had put in an appearance during the season, so we do not cause the excitement here that is common when visiting virgin ground; but still I notice always a crowd of faces in our wake.

For the benefit of the motor-car world in general I should like to voice my opinion of the new tires I had fitted to my car. I told you in a former letter that I was the first to try the new motor wheel section of rubber No. 227 by the Clincher Co., and I must say that after five weeks hard wear over some of the roughest roads imaginable they have proved themselves simply splendid. I mention this solely in the interests of motorists in general, for if my experience benefits me I am keenly anxious that others who drive motor-cars should know of it. The tires are so shaped as to give the advantage of all the rubber without its pressing in any way on the rims, and I am sure this kind of tire is destined to become general when its merits are known.

Yours, etc.,

Ingleton, Yorkshire,  
Sept. 26th, 1899.

T. J. WEST,  
Manager of the Modern Marvel  
Co., Ltd. (of Edinburgh).

#### ENGLISH v. FRENCH-BUILT MOTOR-CARS.

TO THE EDITOR OF *The Motor-Car Journal*.

SIR,—Referring to the letter in your last issue *re* English and French motor-cars, there is no doubt that this whole subject of the particular preference that most people have even yet for French-built motors is one that can be discussed with I think very great advantage to motor-car users all over the country, and Mr. Burgess is to be thanked for bringing forward such an extremely interesting subject.

When, however, we look at the matter fairly, it seems to me that the French are entitled to every credit for the preference which their machines have so far secured in the majority of cases, and the reason for this preference is not far to seek.

The would-be automobilist has only to purchase a motor-car made by one of the well-known firms who do well in races in France, and the result is an absolute certainty that he will obtain a motor which will give him satisfaction for ordinary use in excess of that manufacturer who has not dared to put his wares to the fierce test that these racing contests insure the machines having.

Whilst of course it is very easy to say that these are racing cars and that is not what one wants to buy, still the fact remains that the experience the manufacturer gains from these races is bound to be incorporated in the cars as quickly as possible, simply for his own good-will; and whilst undoubtedly the weaknesses that are developed in these races will come to light through slow touring it will take months to discover the weaknesses that are found out probably in one single race.

Personally, I believe that it is quite possible to purchase motors in England as good as those turned out in France, but even in doing this, directly one goes away from the

touring class he is obviously buying something which the manufacturer has had very little experience in manufacturing.

Speaking for myself, after having an English engine made by Messrs. Napier & Son put into my French Panhard car, I must admit that I have now obtained an engine which in many points commends itself to me as being better than the French engine, and one that has unquestionably far greater wearing possibilities.

This experience has made me confident in trusting this firm to build me a 16 to 20-h.p. racing car for next season's races, and I believe two friends of mine are also going to do the same thing, so that there will probably be three of us with up-to-date racing cars made entirely in England for next year's French racing; and I must say that I look forward with an enormous amount of interest to seeing the completion of these cars and what they will do on the road. But at the same time I quite appreciate that it is quite likely that when we come to travel at average speeds of 35 to 40 miles an hour points may develop that none of us at the present moment dream of when experimenting with my own car, whose top speed is a little over 30 miles an hour and average about 23 or 24.

I am quite in accord, Mr. Editor, with your recommendation that the best way to obtaining the object suggested by your correspondent would be for English manufacturers to make racing cars to compete with French manufacturers, so that would-be purchasers may at any rate see what the manufacturer they wish to go to is capable of doing when put to his best effort.

14 Regent Street, London, S.W.,  
Sept. 26th, 1899.

Yours truly,  
S. F. EDGE.

#### SOME QUESTIONS REGARDING THE DE DION MOTOR-TRICYCLE.

TO THE EDITOR OF *The Motor-Car Journal*.

SIR,—As a reader of your esteemed Journal, I beg to ask a few questions on motor-tricycles. I have a  $1\frac{1}{2}$ -h.p. De Dion, and have ridden it 550 miles and find the dry cells about run down; the spark is very small, and I have only got  $\frac{1}{2}$ -volt. left. I have been very careful to always take out the plug on stopping. Can you or any of your readers kindly inform me through your Journal what distance the battery of four cells should carry me, and which is the best firm to purchase a new one from? I find the machine will not mount some of the steeper hills, although there are only thirteen teeth in the small gear wheel. Do you think  $1\frac{1}{2}$  h.p. sufficient, and can I get a more powerful engine fitted if this is not sufficient? What number of volts should new cells give?

The Gymnasium, Yours faithfully,  
Victoria Barracks, Windsor, H. SHARDLOW,  
September 23rd, 1899. Staff Sergeant.

[Probably some of our readers who have had practical experience with motor-tricycles will send us a reply to the queries raised by Mr. Shardlow.—ED. M.-C.J.]

#### STOCKS' RECENT MOTOR-TRICYCLE RIDES.

TO THE EDITOR OF *The Motor-Car Journal*.

SIR,—Not feeling at all satisfied with the result of my attempted ride from Land's End to John o' Groats, and considering that the weather was too unsettled for, at least a two day's ride, this season, I decided to try and make a successful attempt on a shorter distance, i.e., Edinburgh to London. I left Birmingham for Newcastle at 11.15 p.m. Wednesday, the 20th inst. I arrived in Newcastle at 6.30 a.m. Thursday, and rode to Edinburgh on my Ariel motor-tricycle, as I had never been over the road before and it was necessary that I should familiarise myself with it. I arrived in Edinburgh about 2 p.m., after having stayed three-quarters of an hour at Alnwick for breakfast.

On Friday morning, the 22nd inst., I left Edinburgh at 6 a.m., arrived at Newcastle (121 $\frac{1}{2}$  miles) 11.25 a.m., where I filled up with petrol and lubricating oil, had some sandwiches

and hot coffee, and set out for Doncaster, which I reached at 5.9 p.m. (233 $\frac{1}{2}$  miles from Edinburgh). There I sat down to some nourishing soup, put some sandwiches in my pocket, and set out for London, which I eventually reached 2.35 a.m. Saturday morning, covering 395 $\frac{1}{2}$  miles between the two capitals in 20 hours 35 minutes, without a single mishap to my motor. The latter is, I think, almost a record in itself, quite independent of the fact that this stretch of road has never been covered in less time than 25 hours and 20 minutes.

From 11.25 a.m. Friday morning (15th inst.), when I left Birmingham by train for Bristol, to my arrival back in Birmingham from London, by train, on Saturday (23rd inst.), I covered no less than 1,720 miles, 742 by train and 978 on an Ariel motor-tricycle, my only mishap being a broken experimental exhaust valve between Launceston and Okehampton on Sunday (the 17th inst.).

The distances are made up as follows:—

|              | Train.                  |                      | Motor.                         |
|--------------|-------------------------|----------------------|--------------------------------|
| Friday ..    | Birmingham to Bristol   | 91 $\frac{1}{2}$ ..  | 20 at Bristol.                 |

Birmingham,  
September 26th, 1899.

Yours faithfully,

J. W. STOCKS.

At the last meeting of the Merthyr District Council a licence was granted for a motor-car for ten passengers to run between Troedryhiw and Merthyr.

"AUTOMOBILISM," says the *Newcastle Daily Chronicle*, "will conquer the streets. Electric motors and petroleum motors are making tram-cars as obsolete as sedan-chairs."

MR. H. CARVER, a well-known Bridgwater cycle dealer, and Mr. F. Wills have announced themselves as managers of the Bridgwater Motor Co. They have opened business at East Quay as dealers in motor-cars and cycles of every description.

THE other evening we had a short ride with Mr. Percy Walker, an old racing cyclist, on his new French-built Hurtu car. Mr. Walker has already had some interesting rides, and has promised to send us particulars of one or more of the same for publication.

THE Iveagh phaeton with hood driven by Mr. J. S. Gretton in the recent tour of the Automobile Club attracted much attention by reason of its attractive and neatly-finished appearance. The car, which is the production of the Motor Manufacturing Co., Limited, has, we learn, already been sold by Mr. Gretton at a premium.

AMONG those recently elected to membership of the Automobile Club of Great Britain are the following:—Sir Richard Williams-Bulkeley, Bart., Count Zborowski, Messrs. A. Holford-Gower, Edward Kennard, Hildebrand Harmsworth, St. John Harmsworth, John Smith Brown, Albert Brown, Ernest Brown, B. J. Diplock, and Herbert H. Fuller.

THE Thames Valley Motor-Car Company, Limited, has been registered with a capital of £5,000 to adopt an agreement with H. G. Burford and Co. and J. Van Toll, and to carry on the general business of electricians and electrical engineers, producers and suppliers of electricity, etc. The directors are H. G. Burford, F. A. Rodewald, and J. Van Toll.

## RECENT EXPERIENCES WITH STEAM ON COMMON ROADS.\*

BY JOHN I. THORNYCROFT, F.R.S.

(Concluded from page 467.)

**I**N roofless vehicles it is difficult to arrange for an effective air condenser. Experiments have shown that a plain copper tube, while, possessing ample receptive area, lacks radiating surface; this defect may be largely overcome by the addition of external radiating gills to the tubes so disposed as to present a very short free path to the air currents traversing them. Such an air condenser must be cooled by a fan driven from the engine, and can be made lighter and more compact than if formed of plain tubes; this fan will absorb about 12 per cent. of the whole engine power, and forms a further complication in the design.

The weight of the van, unladen, is about 30 cwt., and a load of one ton is successfully dealt with at a speed of about ten miles an hour along ordinary roads; though fitted with single-speed gear only, the van can mount hills of 1:13 on macadam surfaces. Rear steering has not been found convenient, and all later designs have front steering arrangements.

About two years ago two tip wagons or dust carts were supplied to the Chiswick Vestry. These have been in continuous daily service since delivery, and are often used on Sundays also for the collection of road scrapings. The tipping bodies have a carrying capacity of 6 cubic yards, which in dust-bin refuse weighs from 3 to 4 tons. At Chiswick about 22 cubic yards of material are dealt with per vehicle day. With men working piecework, about 30 cubic yards per day is collected.

The boiler has heating surface of 65 square feet, grate area of  $2\frac{1}{2}$  square feet, and a gauge working pressure of 175 lb. per square inch; it is of similar type to that of the 1-ton van already described. The engine, however, is, in this case, attached beneath the underframe, and is a horizontal compound, having cylinders 3 in. and 5 in. in diameter by 3 in. stroke. The cranks are at 180 degrees, and the cylinders are on opposite sides of the crank-shaft to permit easy running at high speeds. The frame, guides, valves, pistons, and piston-rods are of bronze, to prevent the engine rusting up when standing.

The engine is thrown in and out of gear with a shaft co-axial with its own, by means of a friction clutch; this latter shaft carries a toothed pinion engaging with a spur wheel on the countershaft, the remainder of the transmission being similar to that of the light van already described. Renold "silent" chains are, however, used for the final drive instead of block chains as in the light van.

These vehicles are front steering, the method adopted being that of the "divided axle." The arrangement provides for the turning of the leading wheels, so as to satisfy the condition that their axes of rotation, produced, intersect on that of the rear axle; by this provision, and differential motion of the rear wheels, perfect facility in steering is attained.

In a tip wagon of later design the tipping body is of high-grade steel of the quality used in the construction of torpedo boats; it was feared that this would prove noisy in running, but this was found not to be the case.

The engine is horizontal compound, having cylinders 4 in. and 7 in. in diameter and 5 ft. stroke, placed beneath the under frame; the working parts are completely encased, and the "oil bath" or "splashabout" method of lubrication is adopted. The transmission is effected similar to that of the Chiswick dust carts.

This vehicle, with full load, maintains an average speed on ordinary roads of from 6 to  $6\frac{1}{2}$  miles an hour; at the higher of these two speeds the engine makes 500 revolutions per minute. The extreme length of the motor part only is  $12\frac{1}{2}$  ft.; breadth,  $6\frac{1}{2}$  ft.; and height, 10 ft.

My first passenger carriage was largely an experiment; it is fitted with method of transmission essentially different from that of any of the preceding vehicles. The engine and boiler are carried in the after part, the products of combustion are conducted downwards through a trunk, and discharged directly rearwards.

An air condenser, with radiating gills and air circulating fan, is fitted in the box in the fore part of carriage. The wheels have solid rubber tires 3 in. wide in metal rims.

The transmission is effected in the following manner: A flanged pulley on the engine shaft drives a pair of equal pulleys on the countershaft through a link belt, each of the pair taking one half the belt width in straight-ahead running; the countershaft is in two parts placed co-axially, these parts being respectively driven by the two equal pulleys just mentioned, and carrying at their outer ends sprockets communicating motions to the driving wheels through the medium of chains; the engine is thrown into gear by a belt-tightening jockey pulley operated by the driver.

By the adoption of this device of a pair of pulleys sharing the driving belt between them it is possible to dispense with the expensive "jack-in-the-box" differential gear, and so far as my experiments have proceeded there seems promise of success. The intended action is as follows: On turning a corner the outer driving wheel revolves more quickly than the inner; the belt automatically shifts towards the more quickly moving pulleys, and the correct differential motion of the wheels is thus not only permitted, but directly aided, in this way; as a matter of experience, the carriage is found to respond to the steering wheel with the greatest readiness. The carriage has maintained a speed of sixteen miles per hour with ease, carrying half a dozen passengers.

A 3-ton dray was recently built for a firm of brewers, and commenced running late last December; this dray hauls a further two tons on a second vehicle, and easily maintains a speed of five miles an hour; on several occasions loads of rather more than six tons have been transported at nearly six miles an hour. Its owners consider that it replaces three two-horse drays; the daily journey averages thirty miles, the total mileage to the present date is roundly 5,000.

The boiler, and all mountings, are now placed in front of the driver, but in such manner as not to obstruct his view ahead; the driver is seated on a transverse tank containing part of the feed water, the remainder of which is carried in a tank at the rear end of the underframe.

The extreme dimensions are: Length,  $17\frac{1}{2}$  ft.; breadth,  $6\frac{1}{2}$  ft.; and height,  $9\frac{1}{2}$  ft. The carrying body is of 12 cubic yards capacity, and has been made large to accommodate a good load of "empties" on homeward runs.

The boiler is of the annular water-tube type, with slightly inclined straight tubes, and fire contained in the bottom vessel so as to preserve the tubes from actual contact with the ignited fuel.

Water for a full-load run of fifteen to twenty miles is carried by this dray.

In all the preceding vehicles the final drive is effected by chains. The great difficulty in all self-propelled road vehicles has always been to provide a continuous driving effort without impeding the free and independent play of the bearing springs.

A chain, being a flexible connector, has enabled the difficulty to be overcome, but, so far, not in an altogether satisfactory way; it is found that unless made exceedingly large and effectually encased and lubricated, their life is very short, and the replacement of worn-out driving chains is an important item in the up-keep cost; however, a very large number of vehicles, both heavy and light, are still chain-driven.

In the later vehicles a method of chainless transmission has been adopted, which is, I believe, entirely unlike anything previously used in this country, and the essential features of which may be thus described: The countershaft is in three distinct pieces; the first of these is attached to the channel-steel underframe, and is driven by the engine through a toothed gear; the third is borne in bearings carried by a bracket supported upon an angle-steel frame connecting the front and rear axles, and termed the "perch frame." This third part carries a stout toothed pinion gearing with the spur ring of the differential gear, which is here borne by the rear axle.

These two pieces are connected by a third, or "intermediate link," by means of a pair of specially-designed universal joints, one of which permits also of a transverse sliding motion taking place; these are so made as to provide large bearing surfaces, to ensure durability, and, being wholly enclosed, are dust-proof and oil-retaining.

Between the extremes of no load and a "bump" with full load there is a vertical motion of the underframe, relatively to the perch frame, of 6 in. or 7 in., and this is taken up perfectly by this means, without interference with the continuous torque exerted on the driving wheels, and without bringing any strain upon the frame or mechanism.

The rear axle turns, and is carried in axle boxes somewhat of locomotive type attached to the under-side of a pair of laminated bearing springs; the rear wheels are driven from the felloes, as shown in Fig. 1, by a pair of springs attached to the main axle at the off side and to the sleeve of the differential gear at the near side, pressing against suitable projections from the felloes; by this means the driving-wheel spokes are relieved of the driving effort, and a yielding connection is obtained between the road-wheels and the driving mechanism.

The legal limit of speed is, at present, five miles an hour for the heavier class of self-propelled vehicles; the most recent vehicle is easily capable of maintaining a speed, with full load, of six or seven miles an hour. In fact, in the competition organized by the Self-Propelled Traffic Association early last month, one of these, described as a "standard 3-ton steam wagon, capable of hauling a further 2 tons under ordinary circumstances," transported a load of  $6\frac{1}{2}$  tons about thirty-six miles daily, at a running speed of over six miles per hour, and with this load mounted gradients of the unusual steepness of 1 in 9 at Liverpool.

For general use on ordinary roads, the steam engine gives sufficient range of power without the use of any variable speed gear, and this range is greatest when, as in the present instance, a valve gear permitting of a "linking up" is adopted. My latest vehicles have a compact, constant-lead gear permitting any degree of expansive working, and this is found to result in a decided economy in water consumption.

In most cases, however, it is desirable, and even necessary, to provide a means of considerably increasing the turning effort on the driving wheels in order that soft roads may be successfully traversed or very stiff gradients climbed; for such contingencies a low-speed gear is fitted, enabling a turning effort 75 per cent. greater than the normal to be exerted. The change speed gear adopted also provides for both the driving pinions on the engine shaft being placed out of gear at the same time, the engines then being capable of running freely with the vehicle standing; this permits the engine to be employed for the driving of stationary machinery if required, and also enables the vehicle to be easily moved when steam is not up.

The leading features of my most recent vehicles are briefly as follow:—

The whole motor part, with the exception of the wheels, is of metal, steel predominating. I regret to add that aluminium freely enters into the construction at present, for a reason already dwelt upon. No chains are used, the method of driving already described being adhered to.

The water-tube boiler has straight, slightly inclined tubes, fired from the top, and the fire cleaned through a special door at the bottom.

\* Abstract of paper read before Section G of the British Association, Dover Meeting.

The engine is wholly enclosed, with oil bath lubrication, but is so arranged that easy and complete access to all parts can be readily gained; adjustment is required about once in three months; a constant-lead radial valve gear is fitted, having large bearing surfaces and driving piston valves. The engine is suspended from the underframe from three points in such a manner as to be relieved from all strain due to "winding" of the underframe when running; the feed pump is directly driven by the engine, and the valve box so arranged that the valves are instantly accessible; the auxiliary feed is by a self-starting injector, so designed to enable the cones to be withdrawn while the boiler is under steam.

Two-speed gear is fitted, as already described; a worm-driven steering gear is adopted, allowing free play to the front bearing springs, and having all steering strains self-contained.

FIG. 1.

The motor part permits any type of carrying body being attached, so that one vehicle can be used in a variety of services. Durability, simplicity, economy, and centralisation of control are the main features in the latest vehicles of my design.

Welsh coal is used as fuel, though coke, oil, or inferior fuels can also be burned; used intelligently, Welsh coal causes no smoke nuisance whatever, burns noiselessly, and is not difficult to obtain. Oil is considerably more costly, is not everywhere procurable in sufficient quantity, and is often noisy in burning and liable to leave an offensive odour in the track of the vehicle.

I will conclude by inviting your attention to the accompanying table, which embodies some results recently obtained with heavy steam vehicles, both in this country and in France. The figures for the

"Ravee" have been introduced to enable a comparison to be made between present-day practice with light locomotives and the heavy road engines built some years ago for service in the Punjab. The "Ravee" figures were obtained by Mr. Crompton from the celebrated journey from Ipswich to Edinburgh and back, a total distance of 805 miles; the figures for the other vehicles are almost wholly compiled from official accounts of trials. It will be seen that the palm for minimum water per gross ton-mile remains at present with the De Dion vehicle, a result due mainly to the very considerable amount of superheat employed in these vehicles. The importance of fuel consumption is often over-estimated; this item of expense constitutes not more than 10 per cent. of the total running cost.

The problem of the light locomotive I believe to be already solved in all its main features ; a more extended experience will, of course, suggest many improvements in details. It will be necessary to carry heavier loads than is at present practicable, and this will become possible simultaneously with the removal, or amendment, of the existing restrictions as to tare weights.

THE *Court Journal* is the latest society paper to acknowledge that "the day of the motor-vehicle is coming."

## HORSES FRIGHTENED BY MOTOR-CARS.

At an inquest on Tuesday at Great Baddow respecting the death of Wm. Pickley, a gardener, who died from injuries received through the horse he was driving taking fright at a motor-car near Margaretting, the jury found that no blame was attributable to the driver of the automobile, who was travelling at the rate of only six miles an hour, but they added a rider to the verdict of accidental death that the earliest attention of the authorities should be drawn to the many serious accidents that have recently occurred through motor-cars.

## LONDON TO EDINBURGH ON A MOTOR-TRICYCLE.

UNDAUNTED by his Land's End to Kendal experience, Mr. J. W. Stocks left Edinburgh on an Ariel motor-tricycle, early on Friday morning last, for London. Mr. William Whitson, official timekeeper of the Scottish Road Record Association, sent Stocks away sharp at 6.1 a.m., and all going well, he arrived at St. Martin's-le-Grand, London, at 2.35 on Saturday morning. Stocks' time-table was made out for twenty-one hours, and the actual time occupied, as will be seen, was twenty hours thirty-four minutes.

### MOTOR *versus* HORSE.

AT Ayr Police-Court on Monday, John Connor, hackney carriage driver, Whittlets, for assaulting Thos. Collins, motor-car driver, by striking him a blow on the eye, was fined 10s. with the alternative of seven days imprisonment. It appeared from the evidence that a good deal of bad feeling exists between the hackney carriage and motor-car men in their competition for the traffic to Burns' Cottage, Collins stating that the motor-car drivers had been frequently threatened by the hackney carriage drivers. The assault in question arose from Connor occupying one of the motor-car stands. He refused to remove when asked, and when Collins attempted to lead Connor's horse, the latter struck him on the face.

## MOTOR-CYCLE RACING AT ST. ALBANS.

At the Clarence Park Track, St. Alban's, on Wednesday afternoon last several races were held under Motor-Car Club rules. There were fifteen entries, and of these the majority took part in the races. There were four events, one being confined to local residents. This event produced a good race, the winner, Mr. E. W. Hart, coming in first from scratch in 4 min. 27½ secs. Mr. Jarrott was in good form, and won the two five-mile races from scratch, Mr. Edge in each instance being second. Mr. F. T. Bidlake was timekeeper and Mr. F. F. Wellington judge. The results were:—

Five-mile Handicap.—C. Jarrott, scratch, 1; S. F. Edge, scratch, 2; F. G. Lewin, 1,600 yards start, 3. Won by forty yards. Time, 8 min. 34 1-5 sec.

Two-mile Local Race.—E. W. Hart, 1; R. Burley, 2. Won by fifty yards. Time, 4 min. 27 2-5 sec.

Five-mile Scratch Race.—C. Jarrott (De Dion), 1; S. F. Edge (De Dion), 2; C. G. Wridgway (Phebus-Aster), 3. Won by thirty yards fifty yards separated second and third. Time, 8 min. 43.4-5 sec.

Two-mile Handicap (open).—G. F. Lewin, 650 yards start, 1; J. Machin, 400, 2; S. F. Edge, scratch, 3. Won by thirty yards; twenty yards between the next two. Time, 3 min. 52.5 sec.

THE *New York Herald* announces that a match has been arranged between Henri Fournier, the well-known French chauffeur, and an American motor-cyclist named Skinner. The race will be from New York to Boston.

WE learn that the Hon. G. Baring has recently purchased a De Dion tricycle from the British Motor Company, and may frequently be seen riding his machine in the vicinity of Hyde Park. Count Hermann Hatzfeldt, of the German Embassy, has also been recently instructed by the above-named Company in the use of his De Dion tricycle, and he has become quite an enthusiast, having just completed a very successful run to Chippenham.

In connection with the annual Bradford Cycle and Motor-Car Exhibition to be held in January at the Belle Vue Drill Hall, an effort is to be made to stimulate interest in motor-cars for business purposes. With the object referred to, makers of motor-cars are being invited to compete at the Exhibition for gold and silver medals. The competitions are not to take the form of races, but trials of efficiency and economy in working on main roads in the locality.

## SALES, WANTS, Etc.

[All Advertisements under this heading will be inserted at the minimum rate of 1s. 6d. for 18 words and thereafter at the rate of 1d. per word per insertion, but on no account will any Advertisement be inserted unless prepaid.]

TWO MOTOR DELIVERY VANS, in good condition; can be altered into wagonettes; one £70 and one £125.—Apply Frank F. Wellington, 36 St. George's Square, Regent's Park, N.W.

MOTOR-QUADRICYCLE, Interchangeable to tricycle, by De Dion and Bouton, very little used, exceptional bargain, in grand running order; price £67 10s.—Apply Frank F. Wellington, 36 St. George's Square, Regent's Park, N.W.

DAIMLER MOTOR-WAGONETTE, 5½ h.p., grand carriage, in perfect condition, new tires, repainted and upholstered, to carry four or six, free trial to buyers; price £265.—Apply Frank F. Wellington, 36 St. George's Square, Regent's Park, N.W.

DAIMLER MOTOR-WAGONETTE, 5½ h.p., to carry eight passengers besides driver; geared low for hill climbing, suitable for passenger service, in perfect running order, hardly been used; price £265.—Apply Frank F. Wellington, 36 St. George's Square, Regent's Park, N.W.

BENZ INTERNATIONAL, to carry three; beautifully upholstered, very powerful, all latest improvements, in grand order; price £120.—Apply Frank F. Wellington, 36 St. George's Square, Regent's Park, N.W.

DE DION TRICYCLES (two).—1½ h.p.; electric ignition; in first-class order; £35. Also Werner Bicycle, in running order, £20.—Apply Frank F. Wellington, 36 St. George's Square, Regent's Park, N.W.

MORS CAR to be Sold.—Very fast; splendid condition; 8 h.p.; to carry six persons.—Apply Frank F. Wellington, 36 St. George's Square, Regent's Park, N.W.

WELLINGTON'S "MOTOR-CAR REGISTER AND ADVERTISER" posted free to any address; send post card for copy to Frank F. Wellington, Proprietor, 36 St. George's Square, Regent's Park, N.W.

COVENTRY MOTETTE for Sale, in splendid working order. New 3½ cylinder. What offers?—Grose, Limited, Northampton.

FOR SALE.—Pair High Pressure Horizontal Steam Engines, 2 by 4, made for car; wants valve and eccentric rods fitting to complete; £7 10s. Small Engineering Plant, comprising 8-in. capstan lathe, 5-in. screw-cutting ditto, three spindle drill, two single drills, milling machine, brazing hearth, grindstone, line of 2-in. shafting, hangers and pulleys, benches, vices, etc.; £150 inclusive. Write appointment—J. S., 24 Alfred Road, Acton, W.

BEESTON MOTOR TRICYCLE.—72-m.m. engine, perfect condition, three months old, fitted with tube ignition and electric ignition, complete with neat trailing car and trailing iron; £75; dispensing for car; can be seen and tried.—Apply "Motor," *Motor-Car Journal*, 39-40 Shoe Lane, London, E.C.

SITUATION WANTED by First-class Mechanic as Driver and Repairer, or in motor works; age 37; fifteen months driver of Benz; well up in repairs of all kinds.—Coleman, 3 Egbert Street, Regent's Park.

DRIVER, with certificate of competency from one of the best manufacturing firms in England, requires a Situation; wages, 30s.—Address, 190 White Horse Lane, South Norwood, London

TWENTY PER CENT. INTEREST OFFERED.—Wanted to Borrow £80 on the security of 220 fully-paid £1 British Motor and Motor Manufacturing Companies' Shares.—Address, Box 90, *Motor-Car Journal*, 39-40 Shoe Lane, London, E.C.

## Trade Announcements.

[All Advertisements under this heading will be inserted at the minimum rate of 2s. 6d. for 30 words and thereafter at the rate of 1d. per word per insertion, but on no account will any Advertisement be inserted unless prepaid.]

PLATINUM.—Used Ignition Tubes Wanted, and Platinum Scrap of all kinds Purchased; best prices by Derby & Co., 44 Clerkenwell Road, London, E.C. Established 1797.

NORTH OF ENGLAND AGENTS for Phébus-Aster Motors, best Motor Accessories, Horns, Toolbags, Ignition Plugs, Valves, Piston Rings, etc. Repairs thoroughly done.—J. A. Bennett & Co., 8 Exchange Arcade, St. Mary's Gate, Manchester.

"THE MOTOR-CAR MANUAL," by R. Moffat Ford, deals with every type of oil motor in a plain and simple manner, for lay readers. How to buy a motor-car, and how to treat it when bought. Why is a motor when it stops? How to make an excursion, and so forth. Treats fully of Daimler, De Dion, Benz, Bollée, Panhard, Mors, Peugeot, and other motors. Post free in exchange for Postal Order value 2s. 6d.—The Motor-Car Co., 168 Shaftesbury Avenue, London, W.C. 26-39

IVEL HOTEL, BIGGLESWADE, on the Great North Road.—A large supply of Carless' Petrol and Lubricating Oil always in stock. Ivel Cycle and Motor Works at back of hotel. Accumulators Charged.—Proprietor, Dan Albone.

THE CLIFT ELECTRIC CARS are thoroughly reliable. Batteries run thousands of miles without repairs. Prices from 255 Guineas Motor-Cycles with De Dion Engines, 2-Speed Gear and Free Motor, 84 Guineas; Ordinary, 69 Guineas. Second-hand Electric Car £300. Repairs of all kinds.—E. H. Clift, Sinclair Motor-Car Works, Sinclair Mews, Kensington, W.

BRIGHT STEEL NUTS, PINS, SCREWS, CUPS AND CONES for Motor-Cars and Cycles, in Stock or Pattern. Best English make only.—A. Marmaduke Hart, Vicarage Park, Woolwich, S.E.

## TO CORRESPONDENTS.

All communications intended for insertion in this Journal or relating to Editorial matters should be addressed to THE EDITORIAL DEPARTMENT, MOTOR-CAR JOURNAL, 39 and 40 Shoe Lane, London, E.C. Letters must in all cases be accompanied by the name and address of the writer, as no notice will be taken of anonymous communications.

The Editors cannot undertake to return MSS. or drawings, although every effort will be made to do so in the case of rejected communications. Where such are regarded as of value, correspondents are requested to retain copies.

The Editors do not hold themselves responsible for the opinions expressed by their correspondents, or for statements and facts which do not appear in the editorial columns.

The Editors and Publishers beg also to state that they will accept no responsibility for unsolicited contributions, even if used, unless payment for same is directly specified in forwarding, and the terms arranged before publication.

To insure insertion communications and contributions must be in the Editors' hands by Wednesday forenoon of the week in which the same are intended to appear. Disappointment may be caused by non-compliance with this rule, and to avoid this earlier receipt, if possible, is necessary.

# THE Motor-Car Journal.

Vol. I.]

LONDON, FRIDAY, OCTOBER 6th, 1899.

[No. 31.

Published Weekly by CORDINGLEY & CO., 39 & 40 Shoe Lane, London, E.C.

## COMMENTS.

At a meeting of the Essex County Council this week a long discussion took place on the subject of motor-cars. Mr. O. D. Belsham proposed a resolution to the effect "That the Local Government Board be asked to make further regulations for the better control of motor-traffic." He believed that some of the cars were driven at a rate more nearly approaching twenty miles an hour than fourteen (the limit set by the Act of Parliament); but, even if the regulation speed were not exceeded, the pace was far too fast. Mr. Belsham said the fact must be borne in mind that, whatever the pace fixed, the motor-car drivers would be sure to go faster! The time might come when horses

were extinct animals, to be found only in museums, but in the meantime people who were obliged to use horses were entitled to some further protection from the reckless driving of motor-cars. Capt. H. T. Kemble, who seconded the motion, said that in proof of the necessity of taking some action he understood that in Chelmsford within the next few weeks six new motor-cars would be launched on the road. He suggested, as an addition to the resolution, that they should ask the Local Government Board to fully advertise their regulations and to make the following additions: (1) The speed on turning corners is not to exceed five miles per hour; (2) no person is to be permitted to drive a motor-car in a public place without a certificate of proficiency from the Local Government Board." A number of other gentlemen took part in the discussion, and eventually the subject was referred to the Highways Committee, with power to forward draft regulations to the Local Government Board.

### Death of Mr. Donaldson.

GENERAL sympathy will be felt with Mr. J. I. Thornycroft and his family at the loss they have sustained by the death of Mr. John Donaldson, who, in 1872, married Miss Frances Thornycroft, the sister of the gentleman who is doing so much to secure steam traction on ordinary roads. Mr. Thornycroft and his brother-in-law were, of course, pioneers in connection with torpedo boats and water-tube boilers for the navy, but their interest in automobilism was also great. Curiously enough, the father and grandfather of the late Mr. Donaldson were the owners of all the principal mail coaches of the north of Scotland in the olden days.

### Motor-Vehicles for Breweries.

A READER, who acknowledges that he is a total abstainer from alcoholic beverages, sends a newspaper cutting from which we learn that "a motor-wagon owned by Messrs. Guinness and Co., and laden with porter, became unmanageable when turning from Thomas Street into Francis

Street, Dublin. Instead of going in the direction in which the driver intended, it backed down some yards into St. Augustine Street. The wheels, though revolving, failed, apparently, to catch a grip on the pavements. Ultimately the driver procured some sand, which he threw under the wheels. This had the desired effect, and the wagon proceeded on its way." "Being laden with porter," adds our correspondent, "what else could have been expected?" Really we fail to see the connection between the two. This, however, we do know, that no vehicles can be so well applied for the use of brewers, etc., as those mechanically propelled. Their general use would much facilitate the delivery of barrels—a process that in the case of three-horse vehicles is now often a cause of roadway obstruction.

### The Post Office and Motor-Vans.

A REPORT has reached us this week to the effect that the Post Office authorities are about to recommence the trials with motor-vehicles in the postal service in the place of the horse-drawn carts that are now employed. On the present occasion the trials, which will commence in about three weeks, will be made with an electrical van capable of carrying a load of 30 cwt. and of making a journey of thirty-two miles on one charge of the accumulators. The van is, we believe, being supplied by the Electrical Undertakings, Ltd., of Camden Town, whose display at the recent Exhibition at the Agricultural Hall attracted so much attention.

### An Interesting Race.

ARISING out of the motor-cycle racing at St. Albans last week an interesting match has been arranged between Mr. C. Jarrott and Mr. C. G. Wridgway on the one side and Mr. Fred Cooper and Mr. Marriott on the other. The conditions are that Messrs. Marriott and Cooper, mounted on a motor tandem tricycle, are to ride a five-mile race against Messrs. Jarrott and Wridgway, each of the latter being mounted on their racing tricycles. Messrs. Marriott and Cooper are to have two miles start in five. The race is to take place on the St. Albans track on Thursday afternoon, the 12th inst. The match is a sporting one, and will no doubt prove interesting, as, on the face of it, Messrs. Jarrott and Wridgway have set themselves a difficult task.

### Yorkshire and Automobilism.

ALL round the coast the motor vehicle has been recognised as a paying concern, and in many industrial centres on the Tyne and in Lancashire manufacturers are utilising mechanical power for the transport of goods. So far we have heard little from Yorkshire, where conservatism in the matter of horses seems to prevail. And yet there are towns like Bradford, Halifax, and Leeds where the trade of the district could be much assisted by the adoption of the new method. The adoption of motor-vans in conveying goods from the railway to the mills in the great textile industries is only a matter of time, and we shall be glad to hear from readers in the county of broad acres who have utilised motor-

vehicles for business purposes. In Sheffield, for instance, we are told by a local paper that while the motor-car makes little headway in that town "there are indications which point to its greater employment in the city before long." What are they?

#### A Horse-Owners' League.

In a contemporary we notice the suggestion is made that a horse-owners' league should be established in defence of drivers of horse-drawn vehicles. Already there are many societies, organizations, associations and leagues, so that one league the more would do nobody any harm and find a nice little berth for some young gentleman with ideas. In this capacity we would recommend our office boy for the post, seeing that he is fully acquainted with the enemy to be fought. A horse-owners' league would be useful in educating those who possess animals up to the idea of training their quadrupeds to become used to motor-vehicles. It would certainly be good for little else.

#### An Automobile Gun-Carriage.

REFERENCE was made in a recent issue to the fact that an automobile three-wheel gun-carriage to the designs of Major R. P. Davidson, of the U.S. North-Western Military Academy, is in course of construction in the United States. An outline of the carriage, which is being built at the works of the Duryea Manufacturing Co., Peoria, Ill., is given herewith. Seats are provided for four persons, which constitutes a gun crew. There is provision for carrying 2,500 rounds of ammunition, a few accessories, and fuel. The large petrol tank is placed under the forward floor, so as to be well protected from possible danger, and fuel for a run of 200 miles can be carried. This tank is, states the *Automobile*,

practically bullet-proof. The carriage employs the Duryea system of propulsion. On it will be mounted a Colt automatic rapid-fire gun, firing about 500 shots per minute. The range of the gun is about 2,000 yards. The gun points forward, and is ready for use at any time; it is mounted on a swivel, and can be swung around, up or down, to cover any object, its sweep being that of a full half circle. The carriage will weigh about 900 lb., of which quantity the gun accounts for 80 lb. The running gear is made very strong, to withstand the rough usage to which the carriage may be subjected. A run to New York is contemplated during the present month, and possibly later, when a crew has been drilled in handling the gun, a run will be made to Washington and an exhibit made before the U.S. army officials.

#### Is Motoring a "Craze"?

*Land and Water* asks "How long will this motor-car craze last?" We would deny the wording of the question, and assert that the present development of the automobile industry is not a "craze" but a genuine, practical, business-like effort to deal with a very pressing problem in all our great cities overcrowded with horses and vehicles. The contributor to our contemporary raises an objection to the motor-car because petrol cannot be obtained anywhere—

another case in which he errs, for this is a difficulty very rarely met with. We respect *Land and Water* for its age and prestige, but it must freshen up its ideas a bit—or it will be verging on the antique.

#### The "Daily Graphic."

THE *Daily Graphic* has had its motor-car correspondence, much to the advantage of automobilism. One correspondent has given his observations of the Thornycroft steam motor-vehicle, which he followed down the greater part of Oxford Street and Holborn. "I took careful pains," he writes, "to note the noise made, and I have no hesitation in saying that the total noise was considerably less than that caused by an ordinary 'bus. It was, of course, a different noise, and therefore attracted, by its novelty, more attention." We believe this is the reason of so many attacks on motor-cars. The noise made is different to that to which people have become accustomed. Another correspondent, Mr. A. G. Grange, of Norwood, writes that he is quite willing to put up with the ungainliness—if we accept his description—of the Thornycroft car if it tends to the lessened use of horses as draught animals, and refers to the 3,620 convictions last year for working horses in an unfit state which were obtained by the Royal Society for the Prevention of Cruelty to Animals.

#### Newspaper Contradiction.

THERE is a delightful absence of uniformity in the paragraphs that appear in the newspapers with regard to the progress of the motor-car. "The motor-car craze is in the ascendant," says one leading journal, while another declares that very few vehicles of the horseless type are to be seen in the streets. Again, we read that acting managers are taking to motoring, and then comes news that their uses have yet to be ascertained by the theatrical profession. Meanwhile makers know that they are busy, that the prospects are growing even brighter every week, and that despite police persecution and newspaper criticism the new industry is making great strides towards permanence and success.

#### Automobiles and the Italian Army.

INITIATIVE has not departed from the administrative councils of the Italian Army, and having long experimented with the cycle, the military authorities are now turning attention towards the automobile. In the recent Italian manoeuvres it has been clearly demonstrated that mechanical means of traction can be successfully applied in certain directions, though inadvisable in others. Rough ground interspersed with ditches and nicely overshadowed by bushes was not an ideal condition for automobiles. But in conveying munitions of war and transporting provisions, carrying the wounded off the field or to the nearest hospital tent, the advantages of the automobile have been clearly shown, and where the main roads had to be traversed exceptionally smart work was frequently done. The result of the trials was that it has been decided to add automobiles to the equipment of three regiments; but further than that it is not intended to go. We are not among those who regard the automobile as suitable for every purpose, and before advocating its general employment in military operations would prefer to see it more common in ordinary commercial work.

#### Motor-Cars at Bath.

THE ascent of Lansdown Hill, Bath, by means of a motor-car may sound fanciful, but it has just been demonstrated that the journey can be accomplished with ease and comfort. The fact is the more remarkable when it is pointed out that in parts the gradient is as much as 1 in 7. The trials are due to the initiative of a few residents of Lansdown, who arranged with the Liquid Fuel and Engineering Co. to try the experiment of running one of their steam cars up and down the steep Lansdown Hill.

Several journeys were accomplished on Tuesday and Wednesday of last week, and the results were such as to afford the greatest satisfaction. The inconveniences attending the ascent of the hill by the most general method of locomotion are, states the *Bath Argus*, well known, especially by those who have to make the journey frequently. There is no bus accommodation, which, though annoying, is hardly surprising when the length and steepness of the hill are taken into account. The introduction of the car into Bath caused the greatest interest. There is no doubt, adds our contemporary, that a good service of cars, such as the one under notice, would do much to increase the value of property on the breezy heights of Lansdown, and the success of the experiment last week will probably lead to further steps being taken.

#### Steel or Wood Wheels for Motor-Vehicles.

JUST as in this country, the question of suitable wheels for motor-vehicles is now engaging the attention of builders in the United States. One of our American contemporaries to hand this week remarks that "there seems to be

a difference of opinion among builders as to the relative advantages of wood and steel wheels. Both have their advocates, and it would be useful were tests made to determine exact information in this matter. Practical use is, of course, a sure test of any wheel, but the manufacture of either kind requires an expensive equipment, so that previous tests would be a matter of economy. Record of miles run by different wheels and upon different vehicles is information which will in time be available." As to the relative merits of the two kinds of wheels, it seems in keeping with the widest experience to state that both may be used with advantage at present, and that the choice must depend on the weight and style of the vehicle and the conditions of the road. The wire wheel is better suited to light vehicles and good roads; the wood wheel to heavy vehicles and rough roads.

#### Opposition at Worthing.

PROOF of the position that the motor-car has gained is evidenced by the tactics of the proprietors of licensed hackney carriages at Worthing. No fewer than fifty-six proprietors and drivers of horse-drawn vehicles plying for public hire at that seaside resort have petitioned the Council against the re-licensing of the motor-wagonette belonging to Messrs. Palmer & Co. Evidently they recognise the growing desire of the public to avail themselves of the exhilarating experience of a ride on a motor-car, and feel, with Othello, that their occupation is threatened with a new and promising competitor. They declare that the effect of the motor-car has been to keep "gentlemen with high-spirited animals away from the town." That should be rather in its favour than otherwise, for such horses are often a source of alarm to nurse girls and others, as well as of irritation to the drivers of steady-going, soulless motor-cars. We hope the Council of Worthing will be wiser than its hackney carriage owners. At Bournemouth, Eastbourne, Llandudno and a score of other seaside places of eminent respectability and repute motor-car services are recognised as public conveniences. Does Worthing wish to fall behind in popular estimation?

#### Automobiles for Municipal Work.

ONLY a fortnight ago we referred to the success achieved by the motor-vehicles at Chiswick in the removal of dust from houses, and to the fact that the Hackney Vestry are at present considering a similar departure. We now learn that Mr. T. W. E. Higgins, the Surveyor to the Chelsea Vestry, has sent a letter (reprinted on another page of the present issue) to that body recommending the acquisition of three motor-vehicles to be used ordinarily for cartage of materials, and when not required for that purpose

to be employed in removing dust. We trust that the Chelsea Vestry will see fit to adopt their Surveyor's recommendation.

#### Motorism and the Post Office.

LAST week our Midland correspondent referred to the establishment of a cycle post at Grantham, and added the suggestion that motor-tricycles would be an improvement. Now comes the news that the French Post Office authorities have decided as an experiment to use motor-cycles for the clearance of the letter-boxes in Paris. Should the experiment be successful after a month's trial the hours of clearance will be made considerably later than at present. In New South Wales the adoption of cycles by postmen and telegraph messengers has proved a great success. Seventy-nine bicycles were distributed among seventy-four offices, the cost of their maintenance being £917. Previously the forage allowances to those offices had been £2,335, so that a saving of £1,418 was actually effected. That should have been considerably more, but the cost of maintenance—nearly £12 each cycle—was very excessive. Even at that figure, however, the experience of New South Wales is in favour of mechanical as compared with horse traction.

#### Horses and Motor-Cars.

CAPTAIN H. R. LANGRISHE, writing from Knocktopher Abbey, Co. Kilkenny, to the *Times*, makes a very pertinent contribution to the discussion on horses and motor-cars. Not only is he an enthusiastic automobilist, but he is also a large owner of horses and a Master of Foxhounds—facts which give him authority to speak on the subject. He recognises that horses do not like motor-cars—until they get used to them; and instead of grumbling at the stupidity of the quadrupeds he has endeavoured to teach them better manners. His experiences are recorded in the following extract:—"In October last I bought a Beeston motor-tricycle. Most of my horses were frightened at it, some terrified, but their terrors soon disappeared. I had all the horses exercised close to the carriage-drive and used to ride the tricycle up and down in front of them. In a few minutes half of them took no notice and the other half soon got right. A cart horse was the most difficult to manage; he would not go near the tricycle, so I had him ridden round the machine in a field, getting closer and closer, till at last he would stand with his nose over the engine. Now I beg to suggest how gentlemen may spend their time better than in writing to the papers on the subject—that is, go to the yard of some motor depot or some private owner, ask to have the motor engine started, and lead the pony quietly up to the machine. Do not job him in the mouth and frighten him, but walk him quietly up to the engine." In connection with this matter we notice in the *East Anglian Daily Times* a letter from Mr. Alfred C. Harmsworth, written from Thorrington Hall, Darsham, in which he says:—"Should any person in this neighbourhood wish to have his horse made accustomed to a motor-car during the next fortnight my engineer will be happy to assist him by showing either a motor-tricycle or one of the most modern French motor-carriages." Other automobilists might do the same.

It is reported that the Illinois Electric Vehicle Transportation Co., with a capital of 25,000,000 dols., will shortly have a score or more automobiles in active operation in the streets of Chicago. The electric vehicles will enter into active competition with public carriages and cabs, and the tariff will be considerably cheaper than that now in vogue.

THE American Tool Works Co., of Cincinnati, have just introduced a hub-forming and drilling machine specially arranged for making hubs for automobile vehicles. The tool will, it is stated, finish in ten hours twenty pairs of hubs from 3-in. stock, drilling a  $1\frac{1}{8}$ -in. hole  $3\frac{1}{2}$  in. long, reaming, counter-boring, forming and cutting off. The machine has a friction-gear head with a two-step cone pulley for 5-in. belt.

## JOTTINGS BY A WORLDLING.

I AM wrecked at Richmond, my dry cells having suddenly given out. I had to wire for my man to come down from town, as I could get no new cells here. This seems extraordinary, but it pales before the fact that there is no shop in the town where petrol is kept. There is hardly a village in the most out of the way part of France where one cannot get *Stelline*, or some other motor-car *essence*, and no cycle shop would be considered properly stocked without dry cells to sell to the victims of unscrupulous voltmeters. A Levantine Jew selling the silks of the east to nervous tourists is an apostle of truth compared with one of these instruments when it is trying to keep up the reputation of a set of dry cells. Eleven o'clock, and nowhere to put my quadricycle for the night! It would not get into the Roebuck where I had decided to stay, so I pushed it to the Star and Garter, only to find that the head stableman had gone for the night, and taken the coach-house key with him. To make a long story short, I decided to leave it outside the Roebuck. Soon after midnight two or three policemen tried to persuade the people of the house to wake me, but they made some excuse, and so it was wheeled off to spend its night in the police station. They were very nice about it the next morning, told me chattily they had seized the Duke of Manchester's car in the same way, and let me leave it at the station till my man came down, without charging me a penny. It is good to be able to thus chronicle deeds of kindness and courtesy instead of petty worryings and officiousness.

THE Roebuck is an excellent little hotel, where the food is good and the wine better.

I HAVE only seen one car in Richmond, a Panhard, belonging, I think, to Mr. Weguelin. Is it not curious that here in London's Neuilly one may see one car a day, whereas one could not stand at the corner by the Pavillon Bleu without seeing about one a minute.

## THE AUTOMOBILE CLUB.

IN connection with the celebration of the completion of the third year since the inauguration of the Light Locomotives on Highways Act of 1896, a special meet of motor-vehicles owned by the members of the club, and by friends introduced by them, is to be held at Whitehall Court at noon on Tuesday, November 14th, 1899. Members are specially requested to attend on their motor-vehicles at this meet, and to ask the secretary to send them carriage cards for their own vehicles and for those of friends introduced by them. At 12.15 the motor-vehicles will start for Sheen House Club. By kind permission of the committee of that Club, there will be an informal luncheon at Sheen House at 1.30. Members of the Automobile Club may obtain tickets of admission to the Sheen House Club for themselves and friends (ladies and gentlemen) by applying to the secretary of the Automobile Club.

The annual club dinner, to celebrate the completion of the third year since the inauguration of the Light Locomotives on Highways Act of 1896, will be held at the Whitehall Rooms of the Hotel Metropole, Whitehall Place, on Tuesday, November 14th, 1899, at 7.45 for 8 p.m. The seats will be limited in number. Mr. Roger W. Wallace, Q.C., the chairman of the Club, will take the chair. Members may introduce friends (gentlemen, not ladies), and it is hoped that members will do their best to introduce gentlemen who are likely to join the club. The cost of the dinner, without wine, is 10s. 6d. per head, and seats will be allotted in order of priority of application, but no application can be considered unless it be accompanied by the proper remittance.

## THE TURGAN-FOY LIGHT MOTOR-CARRIAGE.

AN exhibit at the recent motor-car show in Paris which presented several novel features was the light two-seated *voiturette* shown by Les Ateliers de Construction Mécaniques (Turgan & Foy), 96 Rue Carnot, Levallois-Perret, and of which an illustration is given herewith. The frame of the vehicle is built up of steel tubing *l* (Fig. 1) and is supported on the axles—which are hollow—by strong springs. The motor *A* is of the horizontal two-cylinder petroleum-spirit type of  $4\frac{1}{2}$  h.p. The two cylinders are arranged opposite to each other, the piston rods working on to a central crank-shaft, the two cranks being set at an angle of 180 deg. to each other. A feature of the arrangement is that the crank-shaft is located vertically and drives by means of pinions a second vertical shaft which not only acts as the cam shaft actuating the exhaust valves but also carries a large horizontal fly-wheel with steel wire spokes for arms *B*.

FIG. 1.—PLAN OF THE TURGAN-FOY VOITURETTE.

- |                                   |  |
|-----------------------------------|--|
| A. Motor.                         | f. Belt shippers.                            |
| B. Horizontal fly-wheel.          | g. Differential and variable speed gear box. |
| C. Longuemare carburetor.         | h. Silencer.                                 |
| d. Steering hand wheel.           | i. Tubular frame.                            |
| e. Variable speed control handle. |  |

Two pulleys are also mounted on the motor-shaft converted by belts to two pairs corresponding fast and loose pulleys on a horizontal counter-shaft at the rear of the car. From the counter-shaft the power is transmitted to the rear road-wheel axle through one or other of two sets of spur gearing enclosed in a gear case. Four forward speeds are obtainable, two by means of the belts and two by the duplicate spur-gear transmission at the rear, there being two distinct levers. Steering is controlled by a small hand wheel *d* at the side of the car, while two brakes are provided—both operated by foot pedals—one acting on a drum on the differential gear and the other on drums on the rear axle. The cylinders are provided with radial ribs for cooling purposes. The ignition is electrical, while the carburetor is of the Longuemare type. The road wheels are of the suspension type with pneumatic tires, the weight of the two-seated vehicle being given as  $4\frac{1}{2}$  cwt.

## The Turgan-Foy Light Motor-Carriage.

(For description see opposite page.)

FIG 2.—GENERAL VIEW.

### SCOTTISH NOTES.

#### Lanark Meeting.

MUCH comment was excited at Lanark last week by the appearance of several motor-cars at the races. Lanark race meeting is a very old-established one, and is practically the wind-up of the Scottish racing circuit.

It is always attended most faithfully by the Lanarkshire county people, a great many of whom have seats in the neighbourhood. Amongst those present were Prince Francis of Teck and the Grand Duke Michael of Russia, who accompanied Mr. and Mrs. Hope Vere, of Blackmoor. There is usually a fine show of coaches, family 'buses, and other equipages, which bring the various house parties in the district to the meeting. Indeed, for the last two or three years the members of the Lanarkshire Four-in-Hand Club have made a point of having a meet on the occasion of this two-day fixture and driving to Lanark together, lunching afterwards in a special marquee erected for their benefit. It was significant that there was no meet of the Four-in-Hand Club this year, and that several of the county families, who have for long turned up at the *venue* of the day's sport in the family coach, on this occasion came "whirring" gaily upon the scene in automobiles. Plenty of good-natured chaff was indulged in between the votaries of the old and new methods of locomotion, and a number of the former had to admit that it was a great convenience not having to send one's horses away to be stabled till they were required for the homeward journey. The ladies, who were conspicuous among the occupants of the horseless carriages, if one were to judge from the seraphic smiles which lit up their fair faces, appeared to be enjoying immensely the sensations of an automobile

ride. "Ripping," "just lovely," "awfully jolly," etc., were some of the terms used by them to describe what it felt like when travelling at full speed or coasting a small hill. When the ladies take up a thing they do so in no half-hearted fashion. Men have usually to do as women tell them, and when a motor-car comes to be requested by a fair daughter of Eve (whether it be sweetheart, wife, or daughter) the male biped will, we fancy, have to procure it, whether he is an advocate of the new method of locomotion or not.

#### More Proof.

THE number of motor-cars seen touring about the Highlands of Scotland this year has been quite phenomenal. In chatting with another well-known hotel proprietor recently, the subject of motor-cars incidentally cropped up, and the landlord remarked that they appeared to be the coming thing. He said that even in the Trossachs and district hardly a day passed but what some car or cars passed through the place or stopped at his hotel. Of course, this only goes to prove the truth of his prefatory statement that motor-cars are "coming things." Only those who have experienced it can speak of the enjoyable and exhilarating nature of motor-ing, and no place is more delightful for the pastime than in the Highlands of Scotland. The scenery is beyond compare, both in variety and grandeur, the choice of routes is innumerable, and the roads, being in a good many cases those used by coaches running in connection with trains and steamers, are, in most instances, of fairly good surface. Bad roads are to be met with, of course, and hills which cause one to draw a deep breath, but these are exceptions and not the rule, and when they are met with help to add spice to the automobilist's fare, and enable him afterwards to dilate with pride

on the fact of having tackled such-and-such a hill on the second speed (imphm!). Almost daily I hear, often in a roundabout way, of the most unlikely parties having indulged—one would almost imagine surreptitiously—in a motor-car run, and in nearly every case the verdict has been in favour of the horseless carriage. A great many express surprise at perceiving no smell when “on board,” being unaware, of course, until they are told, that the exhaust is usually placed behind and below, so that it is only passers-by who are occasionally treated to a delicious sniff of petroleum. The absence of vibration when running is another source of wonderment to erstwhile prejudiced parties. Of course, automobilists know that these prejudices are at once swept away when practical trial has been made of the horseless carriage, but the difficulty often is to get the practical trial to come off. It is pleasing, therefore, to learn from various sources that an increasing number of people are at present “sampling” motors.

#### Versatile Motor-Cars.

MOTOR-CARS at weddings are not a very common sight as yet; but who knows what changes a few years may produce in this respect? I saw one at a wedding in Motherwell last week in company with an ordinary horse brougham and landau. The car was a covered wagonette, the material used for this purpose being enamelled leather. It had glass windows at each side, and appeared both roomy and comfortable. It carried eight people and made itself singularly useful conveying people backward and forward from the bridal house, church, and station. The ease with which it could be manipulated appeared both to astonish and delight several of the passengers, who apparently were making the acquaintance of an automobile for the first time. The day was a cold one, and some ingenuous damsels who rode in the car were heard to remark that they rather liked the vibration when the car was standing, as it helped to keep them warm. Curious, isn't it, how some people can see an advantage in what others consider a drawback?

#### A Stirling Omnibus.

I SAW a large Stirling steam 'bus on Saturday conveying some twenty “picnickers” for a spin. It picked up its passengers at Blantyre, a village a few miles from Hamilton, and drove them to Strathaven, some twelve miles distant, with about four miles up-hill having gradients of 1 in 30, 1 in 20, 1 in 15, and 1 in 12. The 'bus, which excited a great deal of interest *en route*—and naturally enough, too, since it is the only one in Scotland—ran at a capital pace, ascending the long gradients well, and delighted all concerned by its performance. The roads were very soft from the recent rains, making the test a still greater one. I should imagine that a few machines of this description might very well be put on the road by an enterprising party in some of the Highland coaching districts, and that with success too.

#### The Edinburgh Autocar Co.

THE first general meeting of the Edinburgh Autocar Co., Ltd., was held in Edinburgh last week. Mr. John Macdonald, the chairman, said that, although a statutory meeting with no business to transact, he might make a statement as to what the Company had been doing and intended to do. Having spoken of the difficulty experienced in getting delivery of cars, the chairman referred to another difficulty—that of obtaining competent drivers. These were not in the market, and they found that they had to train their own drivers. That they had been well trained was shown by the fact that they had not had during those months one single accident to life or limb in connection with their cars. These delays had kept them back, but they hoped in a few days to commence running a regular service from Newington, Morningside, and Merchiston. Quite recently their manager,

Mr. Love, had seen reason to send in his resignation. That the directors accepted, and they had appointed their secretary, Mr. T. Roland Outhwaite, as manager. Their private cars had done exceedingly well during the summer months, one of them having been three times round Scotland. Replying to questions by shareholders, the chairman said the directors were keeping an eye on the question of larger cars. The only large car they thought of was the steam car, and the question was whether these would meet with the requirements of the licensing authorities.

#### Place aux Dames.

A MOTOR-CAR was requisitioned one day this week by a well-known nobleman's family, and for what purpose, think ye? That the young ladies might have an opportunity of trying their hand at steering and manipulating an automobile. One gentleman tried his 'prentice hand at the new sport also, but had promptly to take a back seat, the go-ahead representatives of the fair sex simply “knocking him into a cocked hat” as regarded skill and steadiness in steering and dexterity in changing speeds. One young lady in particular got into the knack of handling the car so well that the professional driver who was present to coach them would *almost* have trusted her to drive home the car had she been so inclined. So far, I have only seen one or two ladies driving a car in Scotland, but after this we may soon expect to see ladies riding about in smart little automobiles just as they at present do in pony traps.

#### The Motor Industry.

I HAD a long chat the other day with Mr. Stirling, of Stirling's Motor-Carriages, Ltd., on the subject of the present position and the near future of the industry. He was satisfied that although there were many weak points still remaining in some departments of the industry the business of motor-carriage manufacture was rapidly settling down into a sound position. “Inexperience and, perhaps, self-conceit have been the chief hindrances to earlier success in this country, and in the light of fuller knowledge and later experience makers have learnt how much they were indebted to their Continental compeers,” and British motor-car builders were profiting by following a good lead—for a time, at least, it was safe to do so. Mr. Stirling believed that 1900 would be a highly important one in the history of the movement, and his own Company were making special preparations for it. He was of the opinion that a large business would still be done in the way of motor hiring concerns throughout the country, but expressed the belief that this department could not be “rushed.” Men could not be trained in the proper care and treatment of delicate pieces of mechanism in a day, and it was, in his opinion, the highest folly to rush into the formation of hiring companies which at the moment seemed the most prominent feature of business in the South. Twelve or eighteen months hence shareholders in many of these new concerns would agree with him, and the debit balance of “profit and loss” would be explainable in one word, “inexperience”—inexperience of drivers, inexperience of management. All this he admitted of course was being improved upon week by week, but a word of caution he feared was needed to prevent serious damage being done to the industry, restricting its natural growth, through the over-eagerness of a few interested people to catch immediate business regardless of the future. The largest business was, however, to be done with the “private user,” and with the advent of light motor-vehicles at a moderate price an enormous business was coming.

“BROWN HEATHER.”

THE American Tool Works Company, Cincinnati, has on hand a large contract for machine tools for automobile manufacture in France.

## THE BUCHET IMPROVEMENT IN SMALL PETROLEUM-SPIRIT MOTORS.

THE accompanying illustration gives a view of a De Dion motor fitted with the "culasse Buchet" recently introduced in France, and which seems to be one of the novelties and an improvement to high speed petroleum-spirit engines. It is built so that the valves are exactly on the top of the cylinder, 1 being the inlet valve, 2 the compression tap, and 3 the exhaust valve. In the ordinary De Dion motors a certain portion of the explosive gas is located in a volume on the side of the ignition chamber, and when the explosion takes place these gases do not act directly on the piston and heat very

much this part of the motor. Moreover, the exhaust is more difficult than if the gases could escape directly from the cylinder end. M. Buchet claims that by utilising the whole force of the explosion of the mixture directly behind the piston he can effect an increase in power of 30 per cent. For racing purposes this new cylinder top has proved a success, and no doubt it will soon be adopted for ordinary motor-cycles, for races are, after all, the best way to test the real efficiency of any new design.

D. FARMAN.

THE Twentieth Century Automobile Co. is the title of a company which has just been formed at Cleveland, O., to run a service of motor-vehicles in competition with the electric tramways.

## MOTOR-CARS ON THE CONTINENT.

(From Our Own Correspondent.)

### German Roads.

WE understand that the German authorities have decided that henceforth the various districts will be held legally responsible for all automobile and cycle accidents which occur within their boundaries and which are directly attributable to the bad condition of the roads. We can but hope that this new ruling will have the effect of causing the local authorities in one or two provinces to remedy without delay the present defective condition of their roads.

### Motor-Cycle Race at Geneva.

ON Sunday last there was contested at Geneva a motor-cycle race promoted by the Cycling Union of Switzerland under the title of "Le Championnat d'Europe." The competitors were divided into two heats, the placings being as follows:—First heat: 1, Osmont; 2, Gaste. Second heat: 1, Vasseur; 2, Demester. In the final, which was contested over a distance of twenty kilometres, Osmont took the lead at the start, and was never headed. He finished 650 metres in front of Vasseur, who just managed to beat Demester. The winner's time was 21 m. 8 s.

### Letter Collection in Paris.

THE French Sub-Secretary of State, Monsieur Mougeot, has decided that during the whole of the present month the collection of letters in Paris shall be effected by chauffeurs mounted on petrol motor-cycles. In the event of the experiment proving successful, no doubt this means of collection will be generally adopted throughout Paris, and the authorities will thereby be enabled to considerably delay the hour of collection by reason of the rapidity with which the operation can be effected. It is in this direction that English houses might render good service to the G.P.O., as the work is comparatively light and does not involve those difficulties which the employment of large and cumbersome motor-vans gives rise to.

### The Bordeaux-Biarritz Race.

IN spite of the adverse weather conditions, this race was successfully brought off last Saturday and Sunday. The competitors in the tourists' category, numbering fifteen cars and fourteen motor-cycles and voitures, were despatched on Saturday, at 9 o'clock, from the *contrôle* installed at the corner of the Boulevard de Bègles and the Route de Toulouse, Bordeaux. They broke their journey at Mont-de-Marsan, and on Sunday morning at 12 o'clock re-started *en route* for Biarritz. The racing division left Bordeaux on Sunday morning at 9 o'clock, and several of them had passed through Mont-de-Marsan previous to the departure of the tourists. The ultimate classification at Biarritz was as follows:—Racing Cars (Class A)—1, Levegh, 4 h. 24 m.; 2, Antony, 4 h. 31 m. 30 s.; 3, Petit, 4 h. 56 m. 3 s.; 4, Kœchlin, 5 h. 19 m. 2 s.; 5, Broc, 5 h. 32 m. 20 s.; 6, Georges, 5 h. 38 m. Racing Motor-Cycles (Class B)—1, Bertin, 4 h. 40 m.; 2, Rigal, 7 h. 5 m. Racing Voitures (Class C)—1, Ravenez, 6 h. 23 m. Tourist Cars of 6 h.p. or less (Class A) carrying at least two persons (Series 2)—1, Lafitte, 7 h. 17 m.; four persons (Series 2)—1, Sanson, 7 h. 53 m.; 2, Barberau, 8 h. 45 m. Tourist Cars of over 6 h.p. (Class B) carrying at least two persons (Series 1)—1, Knapp, 8 h. 4 m.; four persons (Series 2)—1, Rolls, 6 h. 44 m.; 2, Calvet, 7 h. 15 m.; six persons (Series 3)—1, Versein, 15 h. 6 m. Tourist Voitures and Motor-Cycles (Class C) carrying one person (Series 1)—1, Cuzacq, 7 h. 35 m.; 2, Geo, 9 h. 9 m.; 3, Couderc, 12 h. 35 m.; 4, Jousset, 13 h. 38 m.; two persons (Series 2)—1, Cornilleau, 9 h. 13 m.; 2, Dubois, 9 h. 51 m.

**Automobile Accident.**

M. FADET, of Amiens, accompanied by a cousin and a friend, met with a nasty accident some few nights ago at Domant-sur-la-Luce, the car going over an embankment and falling from a considerable height. M. Fadet and his cousin were rather bruised and shaken, but the friend escaped without injury.

**The Heavy Motor-Vehicle Trials.**

THE third annual international competition for large automobiles promoted by the Automobile Club of France commenced this week at Versailles, and will continue until the 11th instant. The regulations are similar to those of previous years, the minimum load for vehicles designed to carry passengers or goods, or both, being one ton, while the delivery vehicles are required to convey 750 kilogrammes. During the trials the competing vehicles will travel about 340 kilometres, or some 212 miles. The following is the list of entries: La Société des Voitures Electriques Krieger, delivery van; La Compagnie Internationale des Transports Automobiles, delivery van; Messrs. De Dion & Bouton, 30-h.p. steam omnibus, 25-h.p. steam omnibus, 25-h.p. steam lorry and a 50-h.p. steam tractor; Société des Anciens Etablissements Panhard, omnibus; Messrs. De Dietrich et Compagnie, lorry; M. Edmond Chaboche, 15-h.p. delivery van; and M. Valentin Purrey, 30-h.p. lorry. As in previous years, the French Minister of War has deputed an officer to follow the trials.

**A New Automobile Service at Marseilles.**

THE authorities have granted M. Massot, of Marseilles, permission to institute a service of automobiles between that town and Gap, the route selected being by way of Montmeyan, Tavernes, Barjols, Brignoles, Saint-Maximin and Saint-Zacharie.

**Berlin-Rheinsburg Race.**

ON Tuesday, the 26th ultimo, in miserable weather, the third and last of the races organized by the Committee of the Berlin Automobile Exhibition, was contested. Only seven motor-cycles competed, and the three placed men were Brauda, Schaller, and Pittelkow, in the order named. The distance was 150 kilometres, and the winner's time 5 h. 4 m. 50 s.

**The Berlin-Leipzig Race.**

As we mentioned in our last issue, Messrs. Benz & Co. entered a special racing car in this race, the result of which has given the firm much satisfaction, seeing that it carried off the first prize in the racing section. The new vehicle, which has a motor of 9 h.p., has been constructed very rapidly, Messrs. Benz only deciding on its manufacture after the recent Mainz-Coblenz race. Benz vehicles figured very largely in the race to Leipzig, for not only did they secure the first but also the third prize in the racing section, while in the touring class both the first and second places were secured by cars turned out by the Benz firm.

**Strike of De Dion-Bouton's Workmen.**

ON Monday last at 3 o'clock, 700 workmen employed at MM. De Dion and Bouton's factory at Puteaux went out on strike. As in the case of Monsieur Clément's men some weeks ago, their grievance was against one of the foremen and they demanded his immediate dismissal. The Count de Dion refused to accede to their request and gave them until Monday in which to return to their work. This some 400 did, and the remainder are looked upon as dis-

charged, and the management are engaging fresh hands to take their places.

**Baron P. de Crawhez's Automobile Tour.**

It will be remembered that last winter Baron Crawhez, the well-known Belgian automobilist, made a most extensive tour in Algeria, and we now learn that during the forthcoming winter he will thoroughly explore the central provinces of Italy.

**Motor-Car Construction in Austria.**

THE Austrian Landerbank is engaged in the formation of a new company to undertake the construction of motor-cars in Austria. The old engineering works of Messrs. Escher Wyss & Co., at Leerdorf, near Vienna, have been acquired on behalf of the new company, and it is also reported that the Landerbank has purchased the Austrian and Hungarian patent rights in the Amedée Bollée automobiles of Messrs. De Dietrich & Co., of Luneville, France.

LA SOCIÉTÉ COMMERCIALE D'AUTOMOBILES, of 97 bis Avenue de la Grande Armée, Paris, has just increased its capital to £60,000.

ACCORDING to one of the ladies' papers, Lady Eleanor Brodie has had a dress of soft kid, trimmed with chinchilla to wear when motoring.

WE learn that the purchaser of the special Iveagh phaeton with hood built by the Motor Manufacturing Co., Ltd., for Mr. J. S. Gretton and referred to in our last issue is Mr. H. Passmore, of Bournemouth West.

MANN'S PATENT STEAM CART AND WAGON CO., LTD., has just been registered, with a capital of £25,000, to acquire the business carried on by James H. Mann under the style or firm of "J. H. Mann & Co.," at the Canning Works, Canning Street, Leeds, to adopt an agreement with the said vendor, and to carry on the business of steam cart, wagon and motor-car manufacturers, engineers, boiler makers, smiths; iron, brass, and steel foundries; metal workers, etc.

WE have received a letter this week from one of our readers who is desirous of entering a French motor-car works in the position of an apprentice, paying a premium as in English works. The gentleman in question has a good theoretical knowledge of scientific and engineering subjects. He is anxious to obtain particulars of the position of apprentices in such works, premium required, and chances of employment, after serving full time, etc. Probably some of our readers may be able to afford the desired information.

ON Monday last the Aberdare Valley Motor Service Company was registered with a capital of £5,000, for the purpose of carrying on the business of carriers of goods and passengers, tram-car, omnibus, van, carriage, and motor-car proprietors, and to provide for and carry on a service of such vehicles in Aberdare Valley and elsewhere. Mr. W. D. Phillips is the secretary, pro tem., and the registered office of the Company is 7 Canon Street, Aberdare. We understand that arrangements have already been made by which the Company will commence trading without delay.

THREE automobiles have been built at the works of the Fischer Equipment Company, in Chicago, for the United States Signal Corps. One, a trap, will carry four men, and will be used by the officers of the corps. The other two are covered wagons designed to carry the tools, signals, telephone apparatus, etc., necessary for a signal corps division. Each of these wagons has a carrying capacity of 1,500 lb. and a seat for two men. All three vehicles are equipped with 9-h.p. motors. They were built according to plans and specifications drawn up under the supervision of the Government authorities, and will be tested in Chicago by officers from the U.S. War Department.

## A NEW STIRLING TOURING CAR.

THE accompanying illustration reproduced from a photograph sent us by our Scottish correspondent, "Brown Heather," represents a new touring-car which was recently delivered by Stirling's Motor-Carriages, Ltd., of Hamilton, N.B., to a gentleman in the North who has had his horses and carriages replaced by an automobile vehicle. This latest production of the Hamilton Works possesses numerous points of special interest. At a single glance it can be seen that the carriage is designed for comfort and use in all weathers. It is of the wagonette type, and built to accommodate four persons inside and two on the front seat. The top, which is a panelled one, is portable, so that the carriage can be used as an open car in fine weather. The windows in the top are all movable, and can be let down or raised in the usual way as desired. A finely upholstered partition separates the driving-seat from those behind, and

communication may be made between the passengers and the driver by means of a movable window in the centre of the partition. It will be observed that doors are provided at the side of the driving seat, and these also are fitted with movable windows. The doors are fixed on a special form of hinge, whereby the doors can be instantly removed at will. The windows over the dashboard hinge upward in the usual way. The upholstery of this car is in fine morocco. It is handsomely painted, and does the makers great credit. All the doors are fitted with special locks, so that goods or articles left inside the car at hotels and other stopping places cannot be tampered with or removed. The motor is a 5½-h.p. Daimler of the ordinary type, the vehicle being geared to thirteen miles per hour.

MESSRS. JOHNSON & PHILLIPS, electrical engineers, Old Charlton, have now started a steam lorry in their cartage department. The lorry is built to carry 4½ tons, and has been supplied by the Liquid Fuel and Engineering Co., of East Cowes. We understand that the firm are so far satisfied with the innovation.

A SPECIAL feature of the Midland Cycle and Motor-Car Exhibition which is to be held in Bingley Hall, Birmingham, from Thursday, January 25th, until Saturday, February 3rd, inclusive, will be the motor-car and cycle section. During the exhibition the directors propose organizing a series of motor trials (not necessarily speed contests) over certain Midland roads, particulars of which will be announced later.

## MIDLAND MOTOR NOTES.

By "HERCULES."

### The Control of Motor-Cars.

PEDESTRIANS do not yet appreciate the great control which motor-drivers have over their vehicles, and some incidents at present occasion surprise. When motors are more familiar in the streets, incidents which now form the subject of comment will pass unnoticed. A few days ago in Coventry I saw a collision avoided in a way which gave rise to very favourable comments with regard to the control exercised over motors. At the Burges, one of the narrowest parts of one of the principal streets in the city, a horse and cart stood near the kerbstone. Travelling towards the station was a motor-van bearing the name of a Bournemouth firm. Its speed was about seven or eight miles an hour. Just behind it was a car belonging to the Motor Manufacturing Co. When forty or fifty yards from the stationary cart the driver of the car, which was travelling faster than the van, thought he could pass the van before reaching the cart, but at the last moment he found it was impossible. A collision seemed inevitable, but the driver of the Motor Manufacturing Co.'s car pulled up almost immediately. A bystander exclaimed to his friend, "Jack, I made sure those two cars would run into one another."

### New "Allard" Motor-Cars.

THE Allard Cycle Co., Ltd., Earlsdon, Coventry, are paying a good deal of attention to motor manufacture. Two cars already produced by this Company have met with a favourable reception; one of the cars is upon the sociable principle, while in the other the passengers sit face to face. Each of the cars is constructed for two passengers. Another car the Company intend to produce will seat two or four passengers. This will be of 4 h.p., but the other two are of 2½ h.p. each. The largest of these cars weighs 5 cwt. I had a ride this week in the car which seats the two passengers face to face, and I was soon satisfied of the smoothness of the running. It is very compact, being but 42 in. in width, and those whose storage accommodation is limited will no doubt appreciate this feature. The price is moderate, and the car will meet the needs of those who require a small, compact, and serviceable vehicle. The vapour and compression tops, together with the steering gear, are conveniently situated, also the main lubricator. The car has two speeds, and the speed can be also varied by a commutator which is fixed near to the driver's hand. The road wheels have pneumatic tires. The car mounted Gibbett Hill—a fair test—at a speed of between nine and ten miles an hour. The steering is by means of a ratchet and pinion, and the body of the car is suspended on two compass springs at the front, and on two C springs at the rear. These springs enable the seats to retain a horizontal position notwithstanding the convexity of the roadway, and they also counteract any inequalities of the road, and contribute greatly to the smooth running of the car. The engine and fittings of the car are made on the premises, and the Allard Co. are laying themselves out to supply motors or fittings separately.

### A New Motor-Tricycle Saddle.

CYCLISTS and those who ride motor-tricycles cannot put too high an estimate upon a comfortable saddle. Nothing wearies rider more than saddle-soreness, and those who have gone through the various stages of that unpleasantness will ever be ready to sing the praises of any manufacturer who designs and makes a saddle that is easy and comfortable. E. Lycett, Ltd., of High Street, Deritend, Birmingham, have come very much to the front during the past few years in cycle saddle construction, and have now

brought out what appears to be a very suitable saddle for motor-tricycles and quadricycles. From its appearance it resembles an enlarged cycle saddle. It has four coil springs at the back and a strong spring at the front. It measures 12 in. across the widest part, and is 14 in. in length. This particular saddle has been in the hands of one of the leading manufacturers in Coventry, and for two months past he has given it a severe testing. He has found it so comfortable that he told me he intends to fit it on all his motor-tricycles next season. The extra speed of motor-tricycles and the great vibration necessitate the clip being strong, and on this particular saddle great attention has been paid to that feature. The clip is very powerful, and retains a firm grip upon the saddle pillar. The saddle can be adjusted both vertically and horizontally.

#### Machine Tools for Motor-Car Construction.

MESSRS. WEBSTER AND BENNETT, machine tool makers, West Orchard, Coventry, have recently found it necessary to again secure additional premises in order to cope with their increasing trade. The works have grown into

large dimensions with the developments in the cycle trade, and the firm have several times been compelled to move into larger premises or acquire additional accommodation in West Orchard. They have now secured works in George Street, Coventry, and a large piece of adjoining land in view of future developments. They have assiduously studied the requirements of cycle manufacturers during the past decade, and have been eminently successful in supplying tools for cycle construction. They are now catering for the motor trade, and are meeting with success. Their specialities include the vertical and horizontal type of automatic profiling machines.

#### Increasing Popularity of Motor-Cycles.

Most of the cycling papers are now devoting a good deal of their space to "chats about motors," or in detailing in bright, readable form the experiences of old cyclists who have become "fascinated" by motoring. This speaks

for itself, and proves that the future of the motor industry is regarded as most promising. One reads everywhere of the pressure of orders which firms are enjoying who have thrown themselves actively into the industry, and in most instances the writers seem well informed on the subject. In one of my notes a fortnight ago I stated that the croak of the motor-horn in Coventry is as familiar as the tinkle of the cycle bell. A fellow scribbler on Midland matters has gone one farther, for he says "Coventry is rapidly developing into a screeching city as the result of the motor-car." Indeed!

THE Western Automobile Company has been formed at Denver, U.S.A., with a capital of £2,000.

MR. C. H. OLIVERSON, of Queen's Road, Southport, to whose new motor-car we referred in a recent issue, is removing to larger premises at Kendal.

THE motor-omnibus service between Bournemouth and the adjacent Canford Cliffs was inaugurated on Monday. It will be remembered that we gave an illustration of the vehicle employed in this service in our last issue.

THOSE well-known motor-cyclists, Messrs. Jarrott and Wridgway, have challenged the present holder of the Crystal Palace Brassard, Mr. S. F. Edge, and he will meet them both on the Palace track on Saturday, the 14th inst. A big struggle may be expected for the coveted honour.

At a meeting of the Holland (Lincolnshire) County County Committee at Spalding on Tuesday a resolution was adopted calling upon the police to enforce the law against road-racing cyclists and drivers of motor-cars going at excessive speed. The Chief Constable of Lincolnshire afterwards stated that the police were doing their best, but that identification was difficult.

## CORRESPONDENCE.

### PROSECUTION OR PERSECUTION AT ABERYSTWYTH.

TO THE EDITOR OF *The Motor-Car Journal*.

SIR,—In your issue of September 15th you kindly published a letter from me in which I stated that I had been served with a second summons for furiously driving through a village seven miles from Aberystwyth. I dare say some of your readers will be interested in the result of the same. On Thursday last the said prosecution took place, before a bench of seven, composed of five of the principal landowners in the village in question and two tradesmen. The policeman stated that I was driving at a speed of from fifteen to eighteen miles an hour. My lawyer asked him if he had ever seen a motor-car before, and his reply was that he had seen this car four or five times and the small Benz carriage which was here last year; he admitted that there were no persons or conveyances in the road at the time. My lawyer was able to convince the Bench that we were only proceeding at the third rate, viz., 7.4 miles per hour, yet in spite of the policeman's uncorroborated evidence the magistrates convicted, and imposed a fine of £1. Of course, my lawyer gave notice of appeal, but is it worth the cost, seeing that five out of the seven are sure to be on the Bench at next sessions?

One gentleman on the Bench has since told me that they knew full well there was no case, but owing to the prejudice and pressure brought to bear on the other magistrates by one or two of the landowners on the Bench there was nothing else to do but convict.

The sooner this army of martinets who form the Bench and do as they like are superseded by a paid stipendiary the sooner we shall get justice done.

Aberystwyth,  
Sept. 30th, 1899.

Yours truly,  
W. H. HOLLIER.

### "A MODERN MARVEL."

TO THE EDITOR OF *The Motor-Car Journal*.

SIR,—Knowing the great interest you take in all records of the feats of motor-cars, I thought an account of a run I had on my 6-h.p. Panhard to York and back the other day would interest you.

Accompanied by my friend Mr. Jones and a large luncheon basket, we set out at six o'clock on a cold, grey morning with some feelings of regret for the comfortable "downy" we had perforce just left. The reason of this early rise was that we wished to return home on the same day. Fancy a distance of sixty-eight miles in one day! This would indeed create a record, and set the hair of Rolls and Stocks on end with jealousy. After a hasty breakfast of sardines and cold coffee we mounted our good little car, Mr. Jones causing some merriment to a belated groom by his hopeless endeavours to turn the starting handle. However, at about seven o'clock we succeeded in getting an explosion, and, lo, she moved! and noiselessly and gracefully glided forth into the unknown regions of the great North Road. The early dustmen stared amazed at the unusual sight of "two rosy-faced men" gliding smoothly along the beautiful pavements with unseen force. In about half an hour we were clear of the town, and putting on all speed were soon skimming along at the rate of quite six miles per hour! Oh, that glorious feeling of freedom! Mr. Jones was so overcome that he compelled me to stop the car while he got out to test the specific gravity—of the special Scotch that we had thoughtfully provided ourselves with. In about two hours we arrived at Thirsk, a distance of nine miles, and, being market day, we went through the vast concourse of farmers and horse-dealers with ill-concealed marks of approval. Think what a splendid advertisement this was.

Soon after we left Thirsk we saw coming towards us a splendid motor, which pulled up and passed the time of day. It contained "two-rosy faced" gentlemen, who were

taking the car to Saltburn, where it would negotiate the public traffic. After we passed them we noticed their track, and it will show the enormous speed they had been travelling when I tell you that they had been four times off the road into the ditch! We proceeded some distance, till we came to a very stiff hill, which "my little car" (weight, one ton) took with the greatest ease at quite one mile per hour, and descended the other side with fearful velocity, going quite ten miles per hour, both the brakes having broken, and a steering pin coming out. However, fortunately nothing worse occurred, and, thinking we had better make some repairs to ourselves before starting on the car, we set to work with a will on the luncheon basket. Having satisfied ourselves to the full, we proceeded to mend the brakes, with the help of some putty and one of Jones' boot-laces. It was with the keenest satisfaction that we found all going well again, and, as though to give us its blessing, out came the sun in all the glory of a September afternoon. We may dismiss the rest of the run in a few words: my "good little car" ran splendidly, and after a good tea in York, we started home in the best of spirits, and without further incident reached our home, amidst the plaudits of a large number of friends who had been invited by Jones' wife to see our return, at just one hour before midnight, having completed the sixty-eight miles in eighteen hours!

Yours, etc.,  
Northallerton, Yorkshire, J. E. SMITH,  
Oct. 3rd, 1899. Holder, Record Run, on  
North Road (of Northallerton).

### LADIES AND AUTOMOBILISM.

TO THE EDITOR OF *The Motor-Car Journal*.

SIR,—In regard to your remark that "Lady Harberton will endeavour to convert lady motorists to rational dress," allow me to say that the Viscountess is known to be a level-headed woman, of good taste and of gentlewomanly bearing, and you do her an injustice if you imagine that by kindly permitting the use of her drawing-room for the preliminary meeting of the Ladies' Automobile Club she will in any way whatsoever abuse the opportunity by preaching the gospel of rational dress.

Nor, indeed, will any dress be tabooed, as you predict. Although I am an advocate of dress reform, I am not a faddist nor a fanatic. If a lady finds that she can drive a motor-vehicle skirted, by all means allow her to do so. I drove the Benz car in my ordinary attire, but I preferred my cycling costume for the motor-tricycle; still, if any lady rides the drop-frame tricycle and finds the skirt in no way dangerous, I presume she can, being in a free country, wear what she pleases.

Certainly allow "Worldling" to design a costume for lady motorists, provided he is capable. For my part I welcome any gentleman sufficiently interested in motoring to come to the rescue of lady motorists, and assist them in any and every way possible, whether it be to design and create motor-vehicles or costumes. Both are required.

Notwithstanding your criticism as to the "harmlessness" of our endeavour to start a Ladies' Automobile Club, in another sentence you state that "the matter is developing alarmingly"—how then can it be "harmless"? Maybe, your contributor will apply his wit and ingenuity to detect the wisdom of his remarks.

Mowbray House, Norfolk Street, Yours sincerely,  
Strand, London, W.C., N. G. BACON.  
October 2nd, 1899.

[If Miss Bacon will re-read our "Comment" she will see that the "harmlessness" referred to the Ladies' Club, and the "alarm" was occasioned by the prospect of extraordinary attire. While willing to allow Miss Bacon the last word in the correspondence, we shall be obliged, and so probably will many of our readers, if she will withhold her next letter until after the meeting at Viscountess Harberton's,

when we shall be able to learn the strength of the movement inaugurated by this persistent lady journalist, cyclist, motorist and clubist.—ED. M.-C. J.]

### THE DE DION MOTOR PATENTS IN ENGLAND.

TO THE EDITOR OF *The Motor-Car Journal*.

SIR,—I wish to draw your attention to a little error in one of your paragraphs in the current issue of *The Motor-Car Journal*. No new company has been formed for the purpose of acquiring the patent rights of Messrs. De Dion & Bouton in England, as these rights belong and always have belonged to us. A company has recently been registered with a small capital for the purpose of acquiring the De Dion trading rights in England. This company will be under licence from us and will transact all business in connection with Messrs. De Dion & Bouton's English agency. I shall be glad if you will kindly mention this in your next issue.

40 Holborn Viaduct, Yours faithfully,  
London, E.C., THE BRITISH MOTOR CO., LTD.,  
October 2nd, 1899. CHAS. JARROTT,  
Secretary.

### SUGGESTED IMPROVEMENTS IN IMPULSE MOTORS.

TO THE EDITOR OF *The Motor-Car Journal*.

SIR,—I beg to suggest that gas and oil engines would be improved if the explosion were divided into several small successive explosions. If the cylinder cover were recessed in the middle, and the piston centre elongated to fit into it, the gas on the compression-stroke would be divided into two parts, one part being compressed into the recess and imprisoned there by the piston. Several chambers could be formed in this way, and their contents released and fired successively as the piston moved out. If this idea is any good, and in your opinion worth patenting, you may do as you please with it, only don't forget

Pontypridd, Yours truly,  
October 2nd, 1899. "CRANKY."

### OVER THE WORST TWENTY MILES IN ENGLAND ON A MOTOR-CAR.

TO THE EDITOR OF *The Motor-Car Journal*.

SIR,—No longer can I continue my strain of unbroken success as regards immunity from accidents to our car, for during the past week we have experienced a series of daily mishaps which have caused us endless worry and work, and, as if in verification of the old saying that "troubles never come singly," I have to relate a whole chapter of them. Just at the time, too, when I wanted the most leisure to give you an account of our doings I have the least, and shall therefore, I fear, only very imperfectly describe our "ups and downs," for we have climbed and descended more awkward hills in the last five days than in the preceding five weeks.

Well, to come to details: The route was from Ingleton, Yorkshire to Milnthorpe, Westmoreland, thence Newton-in-Cartmel, Lancashire, then to Tebay, Westmoreland, and on to Shap, over the dreaded fell that is feared by all travellers whether by rail or road. Incident No. 1 occurred just as we started from Ingleton, for at the bottom of the first hill we found something had gone wrong. A minute examination was necessary to discover what it was, and at last we found that a pin inside the governor controlling the cam on the governor-shaft had snapped. Mr. Lax was sent to the local cycle shop at Ingleton; a new pin was made, duly inserted, and off we went to Milnthorpe, arriving about three hours later than we desired. The next morning, on the way to Newton-in-Cartmel, by the action of the car it was painfully evident that something else was the matter, and we fancied that the spring at the back of the main shaft in connection with the friction clutch had lost its power, so faced the inevitable: took off the gear case, found the

spring quite right, and then discovered that the rod in connection with the variable speed-gear had worked loose. It was duly tightened, and off we went once more. But our troubles for the day were not yet over. As we were climbing a very steep hill over a mile long, known as Lindale Brow, there were distinct indications that we were going to stop, and very shortly stop we did—about three parts of the way up the hill. By the heated cylinder we soon ascertained why, and found that the water was not circulating. Mr. Sinclair was soon at the pump, and on examination found that the indiarubber rings had perished, and one of them had actually come off the screw. We thought for sure we were stuck at last, but Sinclair would not give in, and temporarily placed a thin iron washer over the worst ring, replaced it, and we determined to make another attempt. A few young farmers were just passing to attend a harvest festival at Lindale, and at my request willingly gave us a push to the top of the hill, and from there we managed to reach Newton five hours behind time. I at once wired for new rings, which, owing to the out-of-the-way place we were at, did not arrive, and so we had to start for Tebay, a journey of over thirty miles, and one which I never shall forget. We got through Kendal—sixteen miles—all right, and then struck the worst hills yet seen by us, and in the middle of one our car again stopped. We were practically exhausted, and inclined to despair, but it being market day at Kendal several farmers' carts were returning home, and after asking six or seven for assistance, at last a Mr. Prickatt, who lives near Grayrigg, agreed to bring a couple of horses and chains and pull us up the hills and see us to Tebay. So on we went in this fashion up hill, doing the flat and down grade work ourselves, until we reached the famous Docker Brow.

I cannot possibly describe the descent of this hill in such a way as to convey what it really was. The nearest thing I can compare with it is shooting the chutes at Earl's Court, only that it was a great deal longer trip. In the centre was a farmer's cart driven by a woman who was on the wrong side, and we had to pass her round a bend with the car running away. I thought it was all up, and ejaculated a fervent prayer for safety. With a breath of relief and a feeling of great thankfulness, however, we soon found ourselves safe at the bottom. Another examination was then necessary, and after that we knew our motor could do no more, for the result of all the extra strain had bent the pins on the inner part of the friction clutch, and so kept the clutch out of gear. For six weary miles we had to be towed, and, with many happenings that I have not time to relate, reached Tebay at 8.5 p.m. Our show was announced to commence at eight and some 300 persons were around the doors and gave us a hearty cheer as we pulled up in front of the hall. Many willing hands enabled us to get the car right into the Market Hall. A quick unpack, a quick fit up, and the audience seated, the first picture of our motor-car was on the screen at 8.35—surely a record in entertainment work. We were compelled to spend the whole of Sunday to put right the car, and Mr. Sinclair was on his back underneath it nearly all the day. The bent pins referred to had snapped, and had to be drilled out and fresh ones made at the N.E.R. fitting shop at Tebay and put in their places. This was done by the kindness of the railway people. But we could not get our car together again in time to go to Ravenstonedale on Monday, so enlisted the services of the Postmaster of Tebay (Mr. Bell), who drove us there. The people there were greatly annoyed that we had not brought the motor-car which they were so anxious to see, and as we had advertised bringing it we had a very poor house indeed.

On Tuesday at mid-day Mr. Sinclair had everything ready, and then in drenching rain we started for Shap. Although the car was going splendidly I was determined to be prepared for contingencies, and engaged a farmer, Mr. T. Wharton, to accompany us with a trace horse to help us if necessary over Shap Fell. We hardly required his assistance, but as he was there we used the horse over the stiffest part of the fell, and arrived at Shap drenched to the skin, having sat for

the last three miles in a pool of water that had dripped from our mackintosh capes, and by 4.30 p.m. were safely stabled at the King's Arms Hotel, where mine host, Mr. Gregory, gave voice to the words with which I have headed this letter, that we had come over "the worst twenty miles in England." The result of all this appears to me that with endurance, a knowledge of your engine, and not being too proud to yoke up a horse to your car occasionally, you can take a motor to any place in the country. The highest village in England, Nenthead, is on our route, but of this more anon.

Yours, etc.,

T. J. WEST,

Shap Wells,  
October 4th, 1899.

Manager of the Modern Marvel  
Co., Ltd. (of Edinburgh).

## THE RECENT MOTOR-CAR EXHIBITIONS.

WE are able to give herewith two illustrations of the gold medal which has just been issued to those firms which were fortunate enough to secure awards at the Automobile Club's Show at Richmond in June

last. The third illustration depicts the medal which is being prepared for the successful competitors in the "Commercial Efficiency" Trials organized by *The Motor-Car Journal* in

July. As will be seen, it takes the form of a clasp and pendant, the same design of pendant being adopted both for the gold and silver medals.

A SERVICE of motor-cars between Lincoln and Brigg is projected. Mr. F. Morriss, of King's Lynn, is the leading spirit of the new venture.

## AN IMPROVED STEERING GEAR FOR MOTOR-VEHICLES.

THE accompanying illustration represents the improved steering gear for motor cars which has lately been devised by Mr. Geo. Iden, manager of the Motor Manufacturing Company, Limited, and which is now being adopted on the vehicles of that Company. The features of the improved gear are (1) the fewness of the number of parts constituting the mechanism, and (2) the construction and arrangement of the parts in such a way that should any nuts, split pins, or washers by any means become loose, no danger would arise, as the gear would not break down or fail to act.

In the case of a motor-vehicle provided with a pair of steering wheels coupled and having the horizontal axle or shaft of each wheel carried on a vertical pin or axis, each of the latter is provided with a crank arm or lever extending horizontally therefrom. The cranks are coupled or connected by means of a stout, solid bar, each end of which is turned down at about right angles, the turned down ends being screw-threaded and adapted to pass through—so as to be free to turn in—the crank arm or lever on each steering wheel. Nuts and washers are screwed on the connecting rod underneath each crank arm or lever, the latter being thus securely coupled together by a single rod, which is generally termed the "coupling rod."

Towards one end of this coupling rod is pivoted thereto or connected by means of a link or knuckle joint or eyebolt one end of a rigid connecting rod which at its other end is similarly connected to a crank arm or lever, known as the "tiller crank," operated by the steering handle or "tiller." The shaft of this tiller crank is pivoted or journaled in a bearing mounted on a fixed part of the vehicle frame or otherwise suitably mounted, and the tiller itself is rigidly fixed to the tiller crank shaft, so that whatever movement is imparted by the steersman to the tiller will consequently be transmitted to the tiller-crank, which latter, through the medium of the connecting rod, will thereby operate the coupling rod, which in turn will simultaneously move the pair of steering wheels in the same direction, right or left.

It will be seen that the improved steering device is of a very simple character, and consists of but a very few parts.

It is considered that motor cycling in America would develop much more rapidly if the prices of motor-cycles were lower. The import tariff, it is considered, is too high. Carriages and motors imported into the United States are classified as "manufactures of metal," and the tax is 45 per cent. *ad valorem*. One of our transatlantic contemporaries considers that if the tax were reduced to a nominal figure no injury would be done to American manufacturers of automobiles, and that an impetus would be given to automobilism.

## THE COMPRESSION SPACE NECESSARY FOR PETROL MOTORS.\*

FOR determining the size of the compression space of a gas or petroleum-spirit engine a number of things have to be taken into consideration, and the best designed engine in this respect is in the end the best practical compromise between what ought to be done theoretically and what must be done mechanically. The theoretical considerations (*i.e.*, most power for the least consumption of fuel and, incidentally, the least size of cylinder) all point to the side of the smallest possible compression space. This, of course, entails the disadvantages due to a greater percentage of leakage at the enormous explosion pressures. But leakage past the piston and rings of an engine built according to the most advanced knowledge can be reduced almost to a negligible quantity. Fits of piston and rings to withstand satisfactorily pressures in excess of 400 lb. per square inch can, however, not be attained (on a commercial basis) on an ordinary lathe. Such work ought to be done on grinding machinery: the rings especially require such treatment after being cut in order to secure perfect contact all around the cylinder. As such work is a question of proper tools rather than extreme skill of labour we may dismiss the question of leakage at this point by the statement that a petroleum-spirit engine, if properly constructed and properly lubricated, will not waste any appreciable

amount of power in leakage at any pressure we would be able otherwise to employ. The compression of the petroleum-spirit vapour and air (or any gas) produces heat; we can therefore work with a compression up to the point where the heat produced is enough to light the mixture. With very weak mixtures (mixtures so weak in petrol that they cannot be exploded at all unless compressed) the compression of course can be carried to a higher point than if the ordinary "good running mixture," about 1 to 8 or 1 to 9, is used. Leaving out of consideration engines of the Diesel type and considering only the ordinary or Otto cycle engines, fitted with the usual means of

adjusting the mixture and with a fixed time of ignition, we cannot have a higher temperature of compression than about 700 degrees Fahrenheit without premature explosion, which corresponds to a pressure of about 220 lb. per square inch above the air, and at the moment of explosion to something in the neighbourhood of 1,000 lb. per square inch. The compression space in such an engine, if very fast running and provided with very large valves, would be about 13½ per cent. of the whole volume of the cylinder (including the compression space); in other words, 15.45 per cent. of the volume passed over by the piston. Such high compression is only practicable with dilute mixtures, and cylinders that are well cooled by free circulation of cold water. Perhaps the highest practical compression in unjacketed engines would be not far from 200 lb. per square inch, which entails a compression space of about 17½ per cent. of the piston displacement. Such an engine is easy to ignite, even with mixtures which will not work satisfactorily in most engines (which have much lower compression). The drawbacks, however, are that the pressure at explosion is very high—it may reach nearly 900 lb. per square inch. The net working pressure will, however, be higher too, but not in the same proportion. The chief drawbacks are the much greater weights of shaft, connecting rod, frame, and fly-wheel necessary, and, above all, the greater effort required to start the engine; for if the compression is

\*By A. M. Herring in *The Horseless Age*.

relieved beyond a certain limit the energy of the first explosion will not be sufficient to produce the succeeding compression and thus keep the engine going.

For practice the compression space for vehicle motors is often as large as one-half the stroke of the piston, and although this means the consumption of about double the petrol for the same power, and makes ignition more difficult and uncertain and the motor as a whole heavier than it might be, and entails greater necessity of cooling, it still has its advantages—it works satisfactorily (?) in cheaply built engines. Where minimum weight of the engine as a whole (including fly-wheel, etc.) is looked for, a compression space of one-third to one-fourth the volume passed through by the piston is about as small as should be used. This entails explosion pressures from 400 to possibly over 500 lb. per square inch.

THE Countess of Warwick asks, with reference to the proposed ladies' automobile club, "Why do women want to dissociate themselves from men in everything?"

A COMPANY has just been formed at Jersey City, N.J., with a capital of £20,000, to be known as the Mercantile Manufacturing Co., to manufacture motors, vehicles, etc.

THE latest bulletin states that the condition of M. Craninckx, the well-known Belgian chauffeur, has again become precarious, although the doctors still have every hope of saving his life.

THE inauguration of the service of motor-omnibuses between Kennington Gate and Victoria, S.W., mentioned in our last issue has been postponed, the final arrangements for running them not being yet completed.

IT is reported from America that the police of Hartford are to be supplied with automobiles for patrolling and ambulance work. The introduction of such a scheme into England would almost tempt one to join the force and become a "patrol" on a "petrol."

OUR Midland correspondent was fortunately wrongly informed last week regarding the condition of Breakwell, the driver of the motor-car which met with a serious accident at Edge Hill the other week, for on Wednesday we received a letter from Breakwell himself, stating that he is much better and hopes to be back in London in nine or ten days.

THE Columbia and Electric Vehicle Co., Hartford, Conn., who have been devoting most of their attention to electric vehicles for the past two years, have, it is reported, turned to petroleum-spirit motors again with renewed energy, and are experimenting with every known type of petrol motor both in the shop and on the road.

COMMENTING on the recent invasion of motor-cars in the town the *Dover Observer* remarks that compared with the first appearance of these motors the latter day style is positively beautiful; there is no appearance of a cart or 'bus cut off at the shafts, but the whole thing is graceful in its outlines and exceedingly comfortable in its internal economy.

The *World*, in commenting on the increasing popularity of motor-cars, remarks that—"It requires no gift of prophecy to foresee motor-meets in Hyde Park in the course of next season, and to predict the speedy advent of a time when proficiency in the steering of an automobile will be almost as much esteemed as skill in the 'tooling' of a four-in-hand."

A PRESS despatch from Fabyan House, N.H., states that "the first automobile to make the ascent of Mount Washington, 6,300 feet above sea level, arrived at the summit shortly before noon on the 31st ult. In the carriage were Mr. and Mrs. F. O. Stanley, of Newton, Mass. The climb up Mount Washington began at Pinkham Notch, where they spent the night. The distance of ten miles was covered in two hours and ten minutes. This time included delays in replenishing the water tank. Mr. Stanley had never been over the carriage road, which was opened this year, and he says that he could reduce the time to ninety minutes on another trial."

## MOTOR-VEHICLES FOR MUNICIPAL WORK.

THE following is a copy of a letter which has been addressed by the Surveyor (Mr. T. W. E. Higgins, A.M.I.C.E.), to the Vestry of the Parish of Chelsea:—

Surveyor's Department, Town Hall.

Re CARTAGE BY MEANS OF MOTOR-CARTS.

To the Vestry of Chelsea,

My Lord and Gentlemen,

The Vestry has from time to time had under consideration the question of carting dust by means of motor-vans, and I am still making enquiries in the matter. I think the reason why motor-vans were considered most suitable for the removal of dust was because the motor-vehicles which were being made were of large capacity, and therefore seemed adapted to carry material which was of considerable bulk but not of very great weight, but there is probably a greater saving to be accomplished by using motor-vehicles for carrying heavy materials. An ordinary dust van carries 3 cubic yards of house dust, and a motor dust van cannot conveniently carry more than 6 yards, but with heavier material the quantities carried by one-horse carts and motor-cars respectively show much more favourable results as regards the latter vehicles. A one-horse cart carries about 1½ cubic yards of sand or hogging, and about 1 ton 10 cwt. of granite; whereas a motor-van would easily carry 6 cubic yards of sand or hogging, and 4 tons of granite.

For a cart horse and driver, per day, we now pay 9s. 6d., and when at work, per load, 1s. per ton of granite, or 1s. 3d. per cubic yard of sand or hogging. Thus under the present system the cartage of 10 tons of granite and 10 cubic yards of hogging or sand costs £1 2s. 6d., or a week's cartage of such materials £6 15s.

This amount of cartage could be done by one motor-van, and the expenses of such a van are estimated by makers (according to the different types of vans), allowing for depreciation (15 per cent.) and for repairs, from £4 18s. 9d. to £5 12s. 6d. per week.

There is no doubt that we have sufficient work to keep one motor-van constantly employed on ordinary cartage, and that the use of such a vehicle would be less costly than the present system, besides being more cleanly. There would also be plenty of work for one or two more motor-vehicles, to be used ordinarily for cartage of materials, but when not required for that purpose to be used in removing dust.

I think the Vestry might issue advertisements for three motor-vehicles, to be supplied under proper guarantees as to maintenance, cost of working, etc., one to be delivered within four months and the other two within six months.

I should perhaps add that one of the Vestry's two horses has become so infirm that it can no longer be put to its usual work.

I am, my Lord and gentlemen,

Your obedient servant,

T. W. E. HIGGINS, A.M.I.C.E.,

September 26th, 1899.

Surveyor to the Vestry.

## MOTOR-CARS AT LEICESTER.

THE Leicester Motor-Car Company, Ltd., has been formed for the purpose of taking over, extending, and further developing the business of the Leicester Motor-Car Company, Ltd., which was established on April 20th of this year. Since the formation of that Company its business is said to have exceeded the expectations of the shareholders, and the new Company has been formed to provide additional capital for purchasing more cars and generally extending the business. In addition to acquiring more cars of the Daimler type, the directors propose purchasing cars propelled by steam, with a carrying capacity of from fourteen to sixteen passengers, equipped for both summer and winter traffic. The weekly cost per car is stated as having amounted to about £3 3s. per week, and the average weekly earnings of each car to £10, and the directors anticipate that with a larger number of cars a sufficient income will be earned to pay the shareholders substantial dividends. The Company will acquire the whole of the undertaking, property and plant of the first Company, including four specially-built cars, tools, duplicate parts of cars, oil tanks, pumps, oil shed, together with stock of oil, etc., as a going concern, for the sum of £2,500, the vendors taking the whole of the purchase money in fully paid-up shares. The share capital of the Company is £30,000 in £1 shares, of which the public have this week been asked to subscribe for 15,000 shares.

## MOTOR-CAR ACCIDENT.

WHAT might easily have culminated in a very serious accident happened about half-past seven on Friday night last to the large motor-car belonging to the Newport Pagnell Motor-Car Syndicate, and plying between that town and Olney Station. The car, with about half-a-dozen passengers, had just safely descended a hill about a mile outside Newport and was going at a fair speed, when a frightened horse pranced with its rider right in front of the car, which crashed into it with much force. The horse temporarily lost its equilibrium, but fortunately did not unseat its rider, and regaining its feet went off at a furious speed, nothing more being seen of it. The force of the blow knocked the steering apparatus out of the hands of the driver, and even before the brakes could be applied the car had crossed the grass at the side of the road, and its front wheels fell right into the ditch under the hedge, where it remained throbbing and

Plunging until the engines were stopped. The occupants, who included two ladies, were thrown to the front of the car, but luckily no one was hurt, and with assistance the car was drawn out of the ditch, it being found that the only damage done was the breaking of one or two spokes. The journey was resumed at a slower speed and Olney Station reached in safety, though somewhat behind time.—*South Buckinghamshire Standard*.

#### LICENCES FOR PETROLEUM-SPIRIT STORAGE.

At Southwark, on Tuesday, the Holborn Tyre Company, 86 Newington Causeway, were summoned before Mr. Paul Taylor, at the instance of the London County Council, for having in their possession at their premises, 22 Stamford Street, a quantity of petroleum without having a licence, as required by section 7 of the Petroleum Act, 1871. Mr. Colman, who appeared in support of the summons, said that an inspector visited the premises on July 25th, and found five gallons of petroleum-spirit in a cellar and three pints in a room where some men were at work. Mr. Horner Hargreaves, for the defence, said the Company admitted that they had the petroleum in their possession. They did not apply for the necessary licence because the premises were only temporarily occupied. The defendants were fined £7 and 18s. costs.

#### LIGHTS ON MOTOR-CARS.

At Thorpe-le-Soken Petty Sessions on Monday a heavy penalty was imposed in a case brought against William Fenton, motor-car driver, Clacton-on-Sea, for driving a motor-car without a lighted lamp as required by the Light Locomotives Act. It was stated that the Act provided that vehicles should possess a lamp showing not only a white light in the direction the vehicle was proceeding, but exhibit, in addition, a red light behind. The police evidence was that defendant, who was driving a motor-car at about twelve miles an hour, had a light attached to the front of the car, but not in such a way that a red light was shown behind. It was acknowledged that the bracket provided for fixing the lamp was broken, and could not be used. Superintendent Ackers mentioned that he had received several complaints, as the way in which defendant had the light fixed was very misleading. The magistrates imposed a fine of £5 and 9s. 6d. costs; failing distress, twenty-eight days.

#### SERIOUS FIRE AT MCKENZIE'S MOTOR-CAR WORKS.

ONE of the biggest fires the Metropolitan Brigade have had to deal with recently broke out in the early hours of Wednesday morning in Walnut Tree Walk, Lambeth, at the works of Messrs McKenzie, carriage and motor-car manufacturers. The alarm was raised about half-past two, and it is supposed that the fire must have been smouldering for some hours, as by the time the first engine arrived the flames had obtained a good hold of the building. The flames spread with such rapidity that by a little after three the whole place was like a furnace, and the entire district of Lambeth was illuminated. Eventually the services of a large section of the Fire Brigade were called into requisition, and Commander Wells and the principal officers were in attendance. It was soon seen that efforts to save the property itself were useless, and attention was directed to that adjoining. This proved a comparatively easy task, although the Walnut Tree Walk Board Schools, which face the west side of the works, were considerably scorched. Messrs. McKenzie's premises were completely burnt out. Extensive show rooms running around the top floors of the building, containing a large number of motor-cars and carriages, as also 60 electromotors, were destroyed, only four vehicles in various stages of completion in the works underneath being got out and subsequently removed for safety to the Southwark Bridge Road quarters of the London Salvage Corps. Mr. Frost-Smith's car, on which we had an eventful ride in July last, was, in Mr. McKenzie's own words, burnt to a cinder. About 150 hands are thrown out of employment for some months, and the actual damage is roughly placed at about £40,000. The loss, however, it is understood, is fully covered by insurance. The following is the official report which the chief officer presented to the London County Council in the course of Wednesday: "Called at 2.44 a.m. (Wednesday) to 27 Walnut Tree Walk, S.E., to the premises owned and tenanted by A. McKenzie, coach builder; cause of fire unknown; insurance unknown; damage, a range of buildings of three floors, covering an area of about 140 feet by 90 feet (used as manufactory, office and stores), and the contents nearly burnt out, and the roofs destroyed (adjoining and communicating); 27a, ditto, let out in tenements, back front scorched; Walnut Tree Walk ditto; the London School Board, side front scorched; 56 Fitzalan Street, ditto, G. Brittain, builder, a back building of one floor, about 40 feet by 20 feet (used as stores), roof damaged by breakage and the contents by water.

#### FINED FOR FURIOUS RIDING.

At Boston, on Wednesday, Mr. Frederick Rice Goodwin, of Newcastle-on-Tyne; Mr. J. W. Stocks, of Birmingham; Mr. S. F. Edge, of London; and Mr. Harvey Ducros, of Birmingham, were summoned for furious riding on the highway at Swineshead on September 21st. The case

against Mr. Ducros was withdrawn. The evidence against the other defendants showed they were riding at a rate of over twenty miles an hour in connection with Mr. Goodwin's attempt to beat the twenty-four hours road record. Mr. Goodwin was fined £5 and £2 14s. costs; Mr. Stocks was fined £5 and £1 7s. costs. The charge against Mr. Edge was dismissed for lack of identification.

FOR maliciously cutting the tire and air-tube of one of the wheels of a motor-tricycle, a Strathmiglo contractor has had to pay £3.

SIR FRANCIS AND LADY JEUNE left their Berkshire seat, Arlington Manor, near Newbury, on Thursday last week, on a motor-car tour.

THE Wilkins Automobile Co. is the title of a company which has just been formed at San Francisco, Cal., with a capital of £20,000, to make and sell automobiles.

MESSRS. GROSSE, BOUBAULT & Co. is the style of a new concern which has just been formed in Paris (97 Boulevard Montparnasse) to manufacture petrol motors and motor-tricycles, etc.

MM. CHARRON, GIRARDOT & VOIGT will shortly remove to new and considerably larger premises, situate at 45 Avenue de la Grande Armée, Paris, formerly the show rooms of the Singer Company.

JOSEPH APPLEBY, LTD., of the Castle Chain Works, Aston, Birmingham, are devoting attention to the manufacture of driving chains for motor-vehicles, their first production in this direction being roller chains of 1 in. and 1½ in. pitch.

THE Anglo-American Motor-Car Mfg. Co., of Halifax, is at present engaged in removing to new works at Hull Road, York. As soon as they are settled down in their new quarters they promise to send us particulars and illustrations of their new automobile vehicles.

WE learn that Messrs. Clarkson & Capel, of the Clarkson & Capel Steam Car Syndicate, Ltd., London, S.E., left for the United States on Wednesday, the 4th inst., per the "Oceanic." Their visit to America is a business one in connection with their steam motor-vehicles.

WITH reference to Houpiéd's magneto-electric ignition device, illustrated and described in our issue of August 25th last, we learn that the Automobile Association, Ltd., of Prince's Road, Holland Park Avenue, London, W., hold the sole agency for the device in this country.

MESSRS. CHESNEY, DE FALLETANS AND Co. is the style of a new firm which has just been formed at Dijon (21 Boulevard Carnot) with a capital of £4,750 to manufacture and deal in automobiles. We hope to illustrate the vehicles of this new concern in an early issue.

THE Chief of the Fire Department of Baltimore, U.S.A., is reported to be making a thorough study of the automobile with the object in view of using it in the fire brigade service. If he is satisfied with the result of his investigations he will recommend the purchase of one or more automobiles for the Department.

AT a meeting at Portland, Me., recently, of the stockholders of the Keating Wheel Co., of Middletown, Conn., it was unanimously voted to increase the capital to 5,000,000 dols. (£1,000,000), and to change the name to the Keating Wheel and Automobile Co. The present capital is 250,000 dols. (£50,000).

THE Dunlop Pneumatic Tyre Co., Ltd., has sent us a letter in which they point out that all the motor-cycle tires manufactured on the Continent, and which are now being imported into this country, are infringements of patents the property of their Company, and that all importers or users of these tires render themselves liable to legal proceedings. They state that they shall have no other option than to take proceedings against any person engaging in the importation of the tires referred to.

## SALES, WANTS, Etc.

[All Advertisements under this heading will be inserted at the minimum rate of 1s. 6d. for 18 words and thereafter at the rate of 1d. per word per insertion, but on no account will any Advertisement be inserted unless prepaid.]

**QUADRICYCLE.**—2½-h.p. De Dion Motor, two speed gear; mounts any hill. Any one requiring latest Paris type Quadricycle should inspect this. Write in first instance to Silverton Lodge, Dagmar Road, South Norwood, S.E.

**TO MOTOR MANUFACTURERS.**—The Civil Service Cycle Agency, Ltd., having extensive Show Room Accommodation at 292 High Holborn, London, W.C., is prepared to take up Agencies for Light Motor-Cycles. Address with terms as above.

**SPACIOUS PREMISES** to LET or SELL cheap; lately carriage builders to Royalty; main London road; very suitable for motor-car factory.—Write Clemetson, Ashford.

**PARISIENNE VICTORIA COMBINATION.**—New tires; in perfect working order; £85 or nearest offer.—Bickford, Wick Lodge, Brighton.

**TO LADIES.**—Beeston drop-frame Motor-Tricycle; 66 m.m.; beautiful runner; £50; trial invited.—1 Elm Tree Road, St. John's Wood.

**TWO MOTOR DELIVERY VANS**, in good condition; can be altered into wagonettes; one £70 and one £125.—Apply Frank F. Wellington, 36 St. George's Square, Regent's Park, N.W.

**MOTOR-QUADRICYCLE**, interchangeable to tricycle, by De Dion and Bouton, very little used, exceptional bargain, in grand running order; price £67 10s.—Apply Frank F. Wellington, 36 St. George's Square, Regent's Park, N.W.

**DAIMLER MOTOR-WAGONETTE**, 5½ h.p., grand carriage, in perfect condition, new tires, repainted and upholstered, to carry four or six, free trial to buyers; price £265.—Apply Frank F. Wellington, 36 St. George's Square, Regent's Park, N.W.

**DAIMLER MOTOR-WAGONETTE**, 5½ h.p., to carry eight passengers besides driver; geared low for hill climbing, suitable for passenger service, in perfect running order, hardly been used; price £265.—Apply Frank F. Wellington, 36 St. George's Square, Regent's Park, N.W.

**BENZ INTERNATIONAL**, to carry three; beautifully upholstered, very powerful, all latest improvements, in grand order; price £120.—Apply Frank F. Wellington, 36 St. George's Square, Regent's Park, N.W.

**DE DION TRICYCLES** (two).—1½ h.p.; electric ignition; in first-class order; £35. Also Werner Bicycle, in running order, £20.—Apply Frank F. Wellington, 36 St. George's Square, Regent's Park, N.W.

**MORS CAR** to be Sold.—Very fast; splendid condition; 8 h.p.; to carry six persons.—Apply Frank F. Wellington, 36 St. George's Square, Regent's Park, N.W.

**WELLINGTON'S "MOTOR-CAR REGISTER AND ADVERTISER"** posted free to any address; send post card for copy to Frank F. Wellington, Proprietor, 36 St. George's Square, Regent's Park, N.W.

**COVENTRY MOTETTE** for Sale, in splendid working order. New 3½ cylinder. What offers?—Grose, Limited, Northampton.

**BEESTON MOTOR TRICYCLE**,—72-m.m. engine, perfect condition, three months old, fitted with tube ignition and electric ignition, complete with neat trailing car and trailing iron; £75; dispensing for car; can be seen and tried.—Apply "Motor," *Motor-Car Journal*, 39-40 Shoe Lane, London, E.C.

## Trade Announcements.

[All Advertisements under this heading will be inserted at the minimum rate of 2s. 6d. for 30 words and thereafter at the rate of 1d. per word per insertion, but on no account will any Advertisement be inserted unless prepaid.]

**PLATINUM.**—Used Ignition Tubes Wanted, and Platinum Scrap of all kinds Purchased; best prices by Derby & Co., 44 Clerkenwell Road, London, E.C. Established 1797.

**NORTH OF ENGLAND AGENTS** for Phébus-Aster Motors, best Motor Accessories, Horns, Toolbags, Ignition Plugs, Valves, Piston Rings, etc. Repairs thoroughly done.—J. A. Bennett & Co., 8 Exchange Arcade, St. Mary's Gate, Manchester.

"THE MOTOR-CAR MANUAL," by R. Moffat Ford, deals with every type of oil motor in a plain and simple manner, for lay readers. How to buy a motor-car, and how to treat it when bought. Why is a motor when it stops? How to make an excursion, and so forth. Treats fully of Daimler, De Dion, Benz, Bollée, Panhard, Mors, Peugeot, and other motors. Post free in exchange for Postal Order value 2s. 6d.—The Motor-Car Co., 168 Shaftesbury Avenue, London, W.C. 26-39

## TO CORRESPONDENTS.

All communications intended for insertion in this Journal or relating to Editorial matters should be addressed to THE EDITORIAL DEPARTMENT, MOTOR-CAR JOURNAL, 39 and 40 Shoe Lane, London, E.C. Letters must in all cases be accompanied by the name and address of the writer, as no notice will be taken of anonymous communications.

The Editors cannot undertake to return MSS. or drawings, although every effort will be made to do so in the case of rejected communications. Where such are regarded as of value, correspondents are requested to retain copies.

The Editors do not hold themselves responsible for the opinions expressed by their correspondents, or for statements and facts which do not appear in the editorial columns.

The Editors and Publishers beg also to state that they will accept no responsibility for unsolicited contributions, even if used, unless payment for same is directly specified in forwarding, and the terms arranged before publication.

To insure insertion communications and contributions must be in the Editors' hands by Wednesday forenoon of the week in which the same are intended to appear. Disappointment may be caused by non-compliance with this rule, and to avoid this earlier receipt, if possible, is necessary.

# THE Motor-Car Journal.

VOL. I.]

LONDON, FRIDAY, OCTOBER 13th, 1899.

[No. 32.]

Published Weekly by CORDINGLEY & CO., 39 & 40 Shoe Lane, London, E.C.

## COMMENTS.

LAST week we invited information as to the advisability or otherwise of an English gentleman acquainted with engineering seeking employment in a French motor-car works in the position of an apprentice paying a premium as in English works. In response we have received several letters from gentlemen intimately acquainted with the conditions of French motor-car works, and they are unanimous in the view that our correspondent will not be doing a wise thing in becoming an apprentice at any of the French works. The idea prevalent in many of the French engineering establishments is that an apprentice should be given plenty to do, and after the term of apprenticeship is over, unless he has proved himself a very smart man, they take no further interest in him.

At the same time it would probably be extremely difficult for an Englishman to obtain such a position in a French motor-car works, as the French firms are not at all ready to instruct English or foreign persons in the construction of motor-cars, etc. All who have written on the subject conclude with the pertinent question, "Why doesn't your correspondent try some of the English houses? He would obtain very much more satisfaction, and quite as much knowledge."

### Automobiles for Municipal Work.

In our last issue we printed at length a report presented by Mr. W. H. E. Higgins, the Surveyor to the Chelsea Vestry, recommending the Vestry to issue advertisements for three motor-vehicles to be supplied under proper guarantees as to maintenance, cost of working, etc. The matter came up for consideration at a meeting of the Vestry on Tuesday evening, when, we are glad to be able to state, the Surveyor's recommendation was agreed to. The advertisements for the three vehicles will therefore make their appearance in due course.

### "Emancipation Day."—A Run to Brighton.

THE Motor-Car Club were the first to celebrate "Emancipation Day," and they have consistently kept in mind this most notable date in the motor-car movement. This year, instead of a run to Sheen House as was the case last year—a run that hardly served to impress the general public with so good an idea of the modern reliability of motor-cars as compared to a longer run—they will repeat their original plan of journeying to Brighton. The meet will take place outside the Hotel Metropole, on Monday morning, November 13th. The route selected to Brighton will be a repetition of the first run of the Club, viz.: via Croydon, Merstham, Gatton Corner and Reigate—where luncheon will be partaken of at the "White Hart"—and then along the usual road to Crawley and on to Brighton via

Hixstead. In the evening a banquet will be served at the Hotel Metropole, Brighton, to which the Club cordially invite all owners of cars who take part in the run, whether members or not. Those who intend to participate are requested to communicate as early as possible to the Hon. Sec. of the Motor-Car Club, 40 Holborn Viaduct, London, E.C.

### Keep to the Road.

THE lot of the automobilist would not be a happy one if such magistrates as those at Aberystwyth and Stonehaven were as common as horses. Of the eccentricities of the former gentlemen Mr. Hollier has told in our columns, and now we learn that the "Great Unpaid" sitting in solemn state at Stonehaven have fined a motor-car driver of Aberdeen 10s., with £1 2s. expenses, for driving his motor-car on the footpath of the road between Aberdeen and Stonehaven. It appears that there was on the roadway an excitable sort of horse whose bad temper might easily have placed him beyond the control of the driver. To prevent any likelihood of accident to the driver of the animal, and probably a desperate kick at his car, the motor man went to the sidewalk, choosing the lesser, but in the end the most expensive of two evils. Really, what are automobilists to do?

### "Murderous Motor-Cars."

VARIED are the headings under which the weekly newspapers startle their readers with highly-coloured descriptions of alleged motor-car catastrophes, but the palm for sensationalism must be awarded to the *Essex County Chronicle*, which under the heading we have reproduced has some rambling remarks on the subject of automobilism, concluding, after referring to "stenches" and "dangerous nuisances," with the statement that "some of them (the motor-cars) are, in fact, little less than instruments of torture." Such language is too absurd—even for the average penny-a-liner—and we would suggest to the editor of our contemporary that he should watch his young men's "copy," and use the blue pencil with more freedom.

### The Brake Horse-Power of Motor-Cars.

MR. JOHN S. V. BICKFORD, of Camborne, Cornwall, makes the following suggestion with regard to testing the brake horse-power of motor-cars in the last issue of the *Engineer*, adding that if it gives accurate results it would have the advantage of being very easy to carry out: "Let a wooden platform be laid in the examination yard near a strong wall or post with a ring-bolt in it sufficiently strong to stand the utmost pull of the car to be tested. The platform must be quite level, and means should be provided to wet it to keep it from burning. Place the car on the platform and anchor it to the ring-bolt. Now start the engines, and either jack up the weight off the driving wheels or add weight to them till they slip at the speed corresponding to the speed at which it is desired to test the horse-power of the car. I take it that the pull on the ring-bolt measured by suitable means, and

multiplied by the peripheral speed of the driving wheels, will give the power given out at the rims. The platform or brake, being of wood, would not wear the tires, and could be prevented from burning by water."

#### Cambridge City Trams.

CAMBRIDGE is considering the adoption of electric traction in connection with its tramways, which the Council have been empowered to purchase. A rather keen debate took place on the report of a special committee recommending this course, and Mr. Alderman Redfern offered strong opposition to the report, pointing out that the motor-omnibuses were meeting with great success in London, and sooner or later they would probably be tried and adopted in Cambridge. Eventually the tram lines would be worth only the price of old iron should the motor-buses be adopted. He moved that the matter be deferred for six months. Unfortunately, Mr. Redfern could not point to any long period of experience in London, but he and other public men in the provinces will do well, as in this case, to "keep their eye on London," for in motor-omnibuses there is profit for the future. Ultimately it was decided to go on with the tramway scheme; motor-omnibuses will have to wait.

#### Automobiles and Electioneering.

RECOGNISING that automobiles are still a novelty, the managers of the political parties in the United States have, naturally, sought to enlist their aid in advertising the candidates. The agent of the Republican candidate for the Lieutenant-Governorship of Massachusetts contracted with the New England Electric Vehicle Co., of Boston, for a

MADAME SARAH GRAND AND MRS. BAZALGETTE ON A BENZ CAR.

certain number of vehicles for the transport of electors, and "for the proper, legitimate, and modest display from these automobiles of cards and signs calculated to attract the attention of and to notify the public that Republican caucuses are being held on that day, and calculated to attract the attention of Republican voters who shall be favourable to the nomination of the said Bates (the candidate) as aforesaid to go to the polls and vote." Unfortunately the Company repented of the contract, with the result that they are being proceeded against by the other parties. It is hardly a characteristic of Americans to refuse business, and doubtless much surprise will be felt by other business houses in Boston at the action of the Electric Vehicle Company. Probably at the next General Election in the Old Country the employment of motor-vehicles will be as common as tradesmen's traps. So far they have not been greatly tried;

in a Norfolk election both candidates had motor-cars, and one was ordered by Mr. Winston Churchill in his Oldham contest, but it did not reach Lancashire in time to be of service.

#### The Storage of Motor-Car Spirit.

At the last meeting of the Brighton Town Council the General Purposes Committee presented a report from Mr. H. Webster with respect to the use of petroleum-spirit for motor-cars. Mr. Webster stated that he had visited all those places in the borough known to him where motor-car spirit was being kept for use in connection with motor-cars, and in every case found that such petrol was not being kept according to the Secretary of State's regulations. The excuse in every instance given for this irregularity was that firms thought they were exempt from having a licence for petrol, but he pointed out to them that it was only in such cases where the regulations of the Secretary of State were complied with that a licence was not required, and produced a copy of the regulations and instructed those in charge as to what was required of them. He therefore proposed visiting these places again with the object of seeing what had been done in the matter, and would then report further to the Committee. The report was ordered to be entered on the minutes.

#### The Tare Limit of Heavy Motor-Vehicles.

IN his paper on steam vehicles at the recent British Association meeting, Mr. J. I. Thornycroft drew particular attention to the drawback attending the limiting of the tare weight of heavy motor-vehicles to three tons, considering it to be "the one and only obstacle now remaining in the way of the complete solution of the problem of steam on common roads." We now learn that a special conference between members of the Automobile Club Committee, the Council of the Liverpool Branch of the Club, and the representatives of firms engaged in the manufacture of heavy automobile vehicles will be held at the Club on Wednesday, the 15th prox., at 12.30 p.m., the subject of the conference being the advisability of attempting the introduction of a Bill to raise the tare limit.

#### A New Motor Starting Device.

MESSRS. STRADLING & PLENTY, of Newbury, who are agents for the well-known Benz cars in that district, have, we learn, recently introduced a slight improvement in these vehicles whereby the motor may be started without it being necessary for the driver to dismount from his seat. Briefly, the new starting device consists of a special pulley fixed to the fly-wheel with an automatically-acting ratchet, which engages when the wheel is pulled by the wire cord extending to the driver's seat, and is taken out of gear when the engine starts.

#### Accidents and Automobiles.

WE would suggest to those who direct motor-car services for public convenience that they should keep a record of the incidents attending their running, and carefully note all accidents and mishaps. The publication of such results would, we are confident, re-assure those timid men who write to the papers against motor-cars. The Edinburgh Company, for instance, has run over 20,000 miles during the past summer without loss of life or injury to limbs or nerves of passengers. Two accidents to persons in charge of horse-driven vehicles happened, but in each case the drivers of the motor-vehicles were blameless, the cars being at a standstill in both instances. It is gratifying to know that a good type of driver is becoming available for these services; and should any proprietors of cars take our hint we shall be glad to have reports of their observations from time to time.

**Speed on Highways.**

MR. W. T. ELTRINGHAM, of The Mount, Shrewsbury, boldly advocates a lessening of the restrictions on the speed of motor-cars in this country, so that our makers may be encouraged to face the competitors of France and

Germany with racing-cars. In a letter to a Birmingham paper he shows how local authorities are harassing the

THE HON. J. SCOTT-MONTAGU, M.P., ON HIS DAIMLER 12-H.P. MOTOR-CAR.

industry by the imposition of unnecessary restrictions. We are sorry to dampen the ardour of an enthusiast for automobilism, but he must not forget that these restrictions are a result of the breaking of the law in several places. Records of road races are well calculated to alarm aldermen and others who have not the springiness of youth, and if Mr. Eltringham's suggestion as to high speeds reaches the ears of some of them things will go even harder with the automobilists. The average Briton is differently constituted to the Frenchman, and he wants to see a practical car for practical purposes rather than a high-flyer that would be notoriously out of place operating, say, along Cheapside or the Strand.

**An American Authority on the Prospects of Automobiles.**

ON the occasion of a recent visit to Washington, Colonel Pope, the head of the concern manufacturing the "Columbia" electrical vehicles, is reported to have stated, in the course of an interview: "The automobile is the vehicle of the twentieth century. It is certain to make the horse a scarce animal in the big cities. Ten years from now I venture to predict there will be vastly more conveyances of the self-propelling order seen on the streets of Washington than those drawn by horses. Just now electricity has the call in America as a motive power, but it is still in the era of experiment, and no settled opinion can be given as to what force will be ultimately regarded as the best. As yet the cost is too great for the automobile to become popularised, but the high prices of to-day cannot be maintained permanently."

**In "Vanity Fair."**

*Vanity Fair's* cartoon this week is entitled "Automobile," and depicts the Comte de Dion on one of his motor-tricycles. "Jehu Junior" thus refers to the well-known French automobilist:

"Once he was a man of joyous company and dissipation; now he has the honour of being a chief man of the world of automobilisation, which is the newest sport in Paris. He is therefore vice-president of the Automobile Club; and, in association with M. Bouton, the

engineer, he is at the head of the greatest motor-cycle works in France. His position and his relations have done much for the new sport; but his credit is that, having spent his patrimony, he has shown himself able to tackle industry with more than a Frenchman's pluck. He is a good, cheerful fellow, who is generally liked."

**In the West Indies.**

AN excellent little guide to their tours in the West Indies has been issued by the Royal Mail Steam Packet Co., and comes to us through Messrs. Street & Co., from which we learn that a motor-car company has been established at Martinique, and will soon place cars on the road between St. Pierre and Red Cliff, a distance of four miles, occupying the coaches  $1\frac{1}{4}$  hours on the journey, at a charge of 3 francs each passenger. The fare by motor-car is to be 60 centimes, and the journey will be done in half an hour.

**Disorder!**

"THE destructive fire at Mackenzie's carriage and motor-car factory at Lambeth is likely to throw the motor industry into great disorder," writes a gentleman on the staff of our contemporary, the *Financial News*. Probably he thinks that is so, and doubtless has no intention of giving inaccurate information, but we are afraid the statement savours of that frequent desire to decry motor-cars which is a strong point in the programme of the *Financial News*. Still, the industry will survive the opposition of such a journal. At the same time, while smiling at the suggestion that a fire in one motor-car works will dislocate the whole industry, we must not be understood to minimise the loss sustained by Messrs. Mackenzie, whose works were of considerable size and capacity.

**A Day's Run from Sheringham to Blackheath.**

MR. FRED HORNE, of "Chaworth," Blackheath, sends us the following brief account of his recent run from Sheringham to Blackheath, *via* Cromer, Norwich, Thetford, Bishop's Stortford, and Woolwich, with a view of demonstrating the capabilities of a simple motor, such as the Benz, in the hands of a novice: "We left," states Mr. Horne, "Sheringham on our Benz Ideal car at 7.15 a.m. and arrived at Blackheath at 9.45 the same evening (distance, 140 miles), and had a most enjoyable run without any incident

whatever. The roads were very heavy, and the wind strong and dead against us, but the car ran magnificently. When I bought a motor-car eighteen months ago I was entirely ignorant of an engine of any description, but in a month I was quite at home with it, and find motoring the most fascinating sport I have ever taken up. I have driven over 7,000 miles,

and have only once been delayed on the road. I am sending you a photo of my car, which has been slightly altered by Messrs. Mulliner, of Brook Street, W., with excellent results."

#### London's Motor-Omnibus Service.

AFTER some delay the motor-omnibus service in London has been duly inaugurated. It is true that the start is on a very small scale—at present only two vehicles are employed, these running on alternate days—but the Motor Traction Co., Limited, prefer to make sure, if slow, progress, rather than put a large number of 'buses in operation ere the public (and also the horses of the horse-drawn vehicles) have become accustomed to the automobiles. The route is from Kennington Park, S.E., to Victoria *via* Kennington Road and Westminster Bridge, the fare for the whole journey being 2d., with intermediate 1d. stages. The service was inaugurated on Saturday afternoon last. One 'bus has been running daily since, and, so far, we are glad to say, without hitch of any kind. On Wednesday morning, in the fog, we formed one of a small crowd of persons awaiting the "motor" at Kennington Gate, which, on its arrival, filled up so rapidly that we were forced to take an inside seat. We had wished to ride outside, so as to be better able to notice the effect of the motor-'bus on the horses and drivers of the old style omnibuses and trams. The tram horses appeared to take not the slightest notice of the new vehicle, but a few of the 'bus horses were not so quietly disposed, and the drivers of these had their work well cut out to hold them in. When the 'bus was in motion, we, as an inside passenger, felt no more noise than is experienced in ordinary horse-drawn 'buses, it being only when the vehicle was brought to a stop that the beat of the motor was heard and a slight vibration felt. We were particularly interested in

watching the manœuvring of the 'bus when the conductor rang the gong to stop and start to allow passengers to ascend and descend. This was accomplished several times in the course of our ride with the greatest ease, and a nasty block in the traffic in Westminster Bridge Road was negotiated in a manner which should be calculated to give the public a good impression of the motor-omnibus. In fact, it would seem that this has already been achieved, for we were much struck with the calm way in which women folk with babies in arms, on their way to St. Thomas' Hospital, signalled for the 'bus to stop, and took their seats as coolly as if they had been riding in motor-'buses all their lives. It is not necessary for us to give a lengthy description of the 'bus at this time, as it is familiar to most of our readers, and was, in fact, exhibited by Messrs. Bayley's, Ltd., Newington Causeway, S.E., at the Exhibition at the Agricultural Hall in July last. We may mention, however, that it has accommodation for twelve inside and fourteen outside passengers, and that it is propelled by a four-cylinder Daimler motor of 12 h.p.

#### JOTTINGS BY A WORLDLING.

I HAVE a book in my library which has always afforded me much amusement. Published in '27, with the lugubrious title of "Death's Doings," it consists of a series of badly written "original compositions in verse and prose" in illustration of thirty execrable copper-plate conceptions of Death, "At the Feast" and everywhere else that he is least wanted. One of these,

"Death and the Gay Charioteer," deals with the fate of a youth—"the laughter-loving Cytheron"—who took a singularly unattractive lady, with arms out of drawing, for a drive in a sort of *sitz-bad* on wheels, urging her with the fiery words:

"Ah! this is life, happiness, splendour, and glee;  
Mount, mount, my sweet damsel, and journey with me!"

The expedition was an utter failure, for an imperfectly constructed skeleton who had been hanging about the back of the picture suddenly pulled off one of the wheels, to the obvious delight of the poet, who sings in triumph:

"He takes the wheel from thy splendid car,  
And hurls thee prostrate on the plain!"

How like to this petty rhymester is the London public I learned to my own discomfort the other day. When in the North End Road—always fatal to me—flames suddenly burst from an electric car I was driving. All the hobbledoys in West Kensington were round the car in less time than it takes to write of it, laughing and jeering, but not offering a little of that help we so much needed owing to the fact that, as it was Sunday, not a shop was open and not a drop of water to be had. "Not a shop" is wrong, for I discovered at no great distance one of those funny little *boutiques* where they sell chocolates and bootlaces and papers and candy—door open, but no one there. The tutelary god of the chauffeur, however, turned my eyes on a large tin of milk on the counter. I stole it, and soon our fire was out and the car on its way again, followed by the blessings of an old lady, who hoped "as 'ow we'd want milk hev'ry day."

CHORUS (*leg.*): "What, ho! She bumps!"—a cryptic saying, which is especially annoying on another occasion—when, pedal as you will, you cannot get a spark.

A FEW years ago, French women, lead by the Duchesse d'Uzès and other *grandes dames*, took to "bloomers" for cycling in the Bois. English women did not follow their example, and there was a boom in cycling skirts. Now Fashion says to the charming inhabitants of the Champs Elysées and the Avenue du Bois that skirts alone are possible, and the other garments are left to the *gamin* patronesses of the Châlet du Cycle, whose attractive impertinence it suits. A divided skirt is worn on motor-tricycles. *Quæ quum ista sint*, as the Eton Latin grammar has it, I trust that the Chauffeuses' Club may come into existence on an irrational basis, and that Lady Harberton—why will Miss Bacon insist on calling her "the Viscountess"?—will not expect her members to hark back to what will soon be a fashion as extinct as that of the simple woad.

As for the designing of motor-car dresses, I am not a Mrs. Aria or I should be glad to help: but I can tell prospective "chaffeuses"—there is no better word—that many women I know swear by Redfern of the Rue de Rivoli, and say that he and Fred have alone studied the new question thoroughly. The hat is the great difficulty.

# The Underberg-Petroleum-Spirit Motor-Voiturette.

(For description see page 507.)

FIG. 1. GENERAL VIEW

I NEVER went to a *malinée*, but I understand the hat controversy since I bought a motor-quadricycle.

CHARLES V. drove horseless carriages. Albert Durer designed them, and Mother Shipton prophesied of them.

"Carriages without horses shall go.

The world then to an end shall come  
In eighteen hundred and eighty-one."

This was putting the cart before the horse with a vengeance.

THE first time I rode on a motor-car was many years ago. I was a student at the University of Freiburg in the Black Forest. One morning coming back from an early *mensur* a friend of mine in the Renanen corps drew my attention to a large crowd in the Holzmarkt Platz round an automobile stopped for some small repair. I had never seen one before, and with the nascent enthusiasm of the chauffeur I persuaded the driver—with a few marks—to drive me about a mile along the river Dreisam. Our progress was slow, noisy, and bumpy. We had to stop to let the carriage of the Hereditary Grand Duke pass by, when, doubtless nervous of her grimy self before such splendour, the car refused to budge till the next day. Then with many a cheery "*Auf Wiedersehen*" she crawled back to Daimler's works in Karlsruhe, whence she had come.

THE *Age of Steel* recognises that "in a few years the manufacture of the automobile will represent one of the important industries of the United States."

THE motor-cycle race which, as mentioned in our last issue, should have taken place at St. Albans yesterday afternoon between Mr. C. Jarrott and Mr. C. G. Wridgway on the one side and Mr. F. Cooper and Mr. Marriott on the other, was, we learn, just as we go to press, unavoidably postponed owing to something going wrong with the latter's machine.

## MOTOR-CARS ON THE CONTINENT.

(From Our Own Correspondent.)

### Letter Collection in Paris.

THE experiment of effecting the collection of letters by means of automobiles to which I referred last week is now in course of progress, and so far capital results have been obtained. It is in the 12th arrondissement that the work is proceeding, and an average gain of forty-five minutes on the time of the pedestrian postmen has been made.

### A Challenge.

THE three famous chauffeurs, MM. Levegh, Antony, and Broc, who have been so successful with their 16-h.p. Mors cars this season, have just issued a truly sporting challenge, in which they express their willingness to contest a match over the Paris-Bordeaux route with any three other automobilists now racing. This challenge is open for two months, and the challengers are willing to race merely for the honour, or for such a stake as may be agreeable to the acceptors.

### The Heavy Motor-Vehicle Trials.

THIS competition, promoted by the Automobile Club of France under the title of "*Le Concours des Poids Lourds*," commenced at Versailles on the 5th inst., and terminated on Wednesday last. As was only to be expected, the general public showed but little interest in the trials, and the daily attendances consisted almost entirely of persons interested in the automobile industry. Of the original entries only seven were present at the start, and several of these bore the appearance of having been hastily completed for the contest; indeed, in one or two instances it was the vehicle's

initial trip. The competitors were: 1, Krieger delivery van; 2, Jenatz delivery van; 3, De Dion steam omnibus, 30 h.p.; 5, De Dion steam lorry, 25 h.p.; 6, De Dion steam tractor, 50 h.p.; 7, Panhard omnibus; 9, Dietrich lorry. Nos. 1 and 2 are exactly similar to the vehicles respectively employed by the two great Paris establishments, "Bon Marché" and "Le Louvre," and are therefore well known both to all residents of Paris. No. 3 is a type almost equally well known, and has accommodation for twenty passengers. The two types as represented by Nos. 5 and 6 were competitors in the trials of 1898, and Messrs. Panhard and Levassor ran a similar type of car to their present representative (No. 7) in the competitions of 1897 and 1898. The type No. 9 was also represented in last year's trials, and is destined for use in the Soudan. I hope to send you details of these most interesting trials next week.

#### Motor-Cycle Races at Madrid.

ON Sunday next, on the Campos Eliseos track, at Madrid, there will be contested the first motor-cycle race yet held in Spain, and valuable prizes are offered.

#### Automobile Service at Brunswick.

IN common with so many of the Continental towns, Brunswick, Germany, is to have an automobile transport service. The first vehicle will probably commence operations about the 15th instant.

#### Automobile Exhibition at Lyons.

IT is proposed to hold an exhibition of automobiles and cycles at Lyons towards the end of November. Full particulars will be announced in due course.

#### The Automobile Club of France.

At a recent meeting the Committee of the Automobile Club of France decided to offer a bronze medal to M. Forestier as an acknowledgment of his work in organizing the various competitions promoted by the Club, and a medal and a diploma were also awarded to M. Georges Prade, of the *Vélo*, as a souvenir of the Paris-Ostend race. At the same meeting it was resolved to charge all new members joining the Club after January 1st, 1900, an entrance fee of 200 francs. I may mention that the present annual subscription is 200 francs, and that the number of members on the books is 1,934. The Committee will endeavour to obtain a part of the Bois de Boulogne on which to hold next year's International Exhibition of Automobiles, so probably manufacturers will have an opportunity of showing their vehicles in motion.

#### The Count de Dion.

IT is rumoured that at the next election the Count de Dion will stand as a candidate for the representation of the canton of Carquefou in the general council of the department of Loire-Inférieure.

#### More Records.

BÉCONNAIS is truly irrepressible! Not satisfied with beating the records of other motor-cyclists, he reduces his own times from week to week with almost clockwork regularity, and I very much doubt whether he will cease his efforts even after he has achieved his ambition of covering 70 kilometres in the hour. On Sunday last, at the Parc des Princes, he gave an exhibition of speed-travelling which fairly electrified the crowd of spectators. He covered 16 kilometres in 13 m. 59 $\frac{3}{4}$  s., thus making an average speed of 20 metres per second. But it was on Monday afternoon

that he achieved a still more wonderful performance, for he then succeeded in beating the existing figures for the hour by no less than 4 kilometres 244 metres. His times were as follows:—10 kilos., 8 m. 41 s.; 20 kilos., 17 m. 19 $\frac{1}{2}$  s.; 30 kilos., 26 m. 3 $\frac{1}{2}$  s.; 40 kilos., 34 m. 55 s.; 50 kilos., 43 m. 48 $\frac{3}{4}$  s.; 60 kilos., 52 m. 49 $\frac{1}{2}$  s. Hour—67 kilometres 901 metres. All previous records were beaten with the exception of that for the first kilometre, which remains at 1 m. 3 $\frac{1}{2}$  s. Béconnais rode a Phébus tricycle.

#### Automobiles for the French Soudan.

*La France Automobile* in its last issue illustrates a special 9-h.p. De Dietrich car, which is about to be despatched to the French Soudan, where it is to be used in connection with the postal service. The car takes the form of a charr-a-banc, the seats being made to lift up. The entrance to the car is located at the rear.

#### The Bennett Challenge Cup.

THE Commission Sportive of the French Automobile Club is drawing up a series of regulations regarding the automobile races in connection with the Bennett Challenge Cup. It is rumoured the projected regulations provide that any races in connection with the cup will not be between individual riders, but between three or five members of each of the contesting clubs, the race to be run in the country of the club holding the cup, and the distance to be at least 600 kilometres.

#### Price of Motor-Car Spirit in Paris.

FROM the first day of the present month the price of motor-car spirit for automobiles has been advanced 5 cents per litre. "Chauffeurs," says the *Figaro*, "now have to pay 65 cents per litre in Paris and 50 cents outside the fortifications."

#### The "Ailsa Craig" Motor - Tricycle Stand.

THE "Ailsa Craig" motor-tricycle stand is now being introduced into France. The agency for it has just been taken up by Messrs. Farman and Co., 25 Rue de la Paix, Paris. Mr. Craig writes us from the French capital, stating that the stands have created a favourable impression in motor-cycling circles there, and that he has already booked orders which will take him three months to complete.

C. R. IUNGERICH and Dr. M. L. Williams have petitioned the City Council of Champaign, Ill., U.S.A., for a 20-year franchise to operate a system of automobiles. The carriages will be run at 10-minute intervals over a regular route, and as soon as the franchise is granted it is stated that a company will be organized to further the project.

THE Duryea Mfg. Co., of Peoria, Ill., have for some time been making three-wheel motor-cars. Since many people, however, look with suspicion on anything out of the ordinary, the Company, and their licensees, the Peoria Rubber and Mfg. Co., of Peoria, Ill., have decided to also make their motor-vehicles in the four-wheeled style, although stating that they believe the three-wheeler to be superior in many respects. The mechanism of the vehicle is similar to that used in their other cars, consisting of triple-cylinder motor geared by chain to the driving axle for ordinary speeds, but having a power gear for hill-climbing or reversing. The steering of the four-wheeler is effected by pivoted heads just inside the forward hubs. These new vehicles, like the three-wheelers, have the driving wheels well under the load, so that ample traction is secured, while the steering wheels are placed well forward, making a long wheel base which gives steady and secure steering.

## THE UNDERBERG PETROLEUM-SPIRIT MOTOR-VOITURETTE.

WE have already referred in previous issues of this journal to the large number of light two or three-seated motor-vehicles which have lately made their appearance in France. Among these is the voiturette made by M. E. Underberg, of Rue Coulmiers, Nantes, of which we are now able to publish a brief description, together with illustrations (Figs. 1, 2 and 3). The car is arranged to carry two persons, although a small folding seat may also be adapted

FIG. 2. ELEVATION OF UNDERBERG MOTOR-VOITURETTE.

FIG. 3. PLAN OF UNDERBERG MOTOR-VOITURETTE.

in front for a third passenger or for luggage. The motor is a single-cylinder Gaillardet, of the type described in our issue of July 7th last. It is capable of working up to 3 h.p. The ignition is electrical, while the cooling of the cylinders is effected by means of radial fins. As will be seen it is located at *M*, in the fore part of the carriage. The carburettor *C* is of the constant level type, and is fed under the action of gravity from the petrol storage tank arranged under the main seat. It is provided with a two-way valve, controlled from the steering pillar, by means of which both the amount of air and spirit in the explosive mixture can be regulated. Provi-

sion is made for starting the motor by means of a detachable handle. Four forward speeds are provided, the variable speed gear being controlled by the lever *L*. The motor transmits its power to an intermediary shaft *A*, on which are mounted four gear wheels in such a way that while rotating rapidly with the shaft they are free to move laterally under the action of the lever. Thus any one of the wheels can be placed in gear with the corresponding pinion on the second countershaft *B*. On the inner end of the latter is mounted a pulley *p*, which is connected by a belt *E* to a large pulley *P* surrounding the differential gear on the rear road axle. The latter is carried in a special manner, in such a way that by means of the foot pedal *P*<sup>1</sup> it can be moved backwards or forwards a small distance, thus tightening or slackening the driving belt, the use of a friction clutch to cut out the motor from the driving gear being in this way obviated. The frame of the vehicle is built up of steel tubing, and is supported on the axles by means of springs. The road wheels are of the cycle type, fitted with pneumatic tires. The car weighs, complete, 5½ cwt. It can, it is claimed, attain an average speed of twenty-five kilometres per hour and ascend gradients of 12 per cent.

THE Hudson Gas Motor and Vehicle Manufacturing Co. has been organized at Saratoga Springs, U.S.A., with a capital of £20,000, to manufacture motors, vehicles, etc.

ON another page of the present issue we publish an interesting account of a race and a tour in the South of France, for which we are indebted to Mr. Staplee Firth.

IN answer to "H. T. L.," we may state the agency for this country for the Empress motor-voiturette described in our issue of the 9th ult. is held by the United Motor Industries, of 3 Rue Meyerbeer, Paris, to whom all enquiries regarding the vehicle should be addressed.

ON Wednesday last Messrs. Hewetson, of Dean Steet, Oxford Street, London, W., subjected one of their No. 1 Benz "Ideal" cars, with parcel van top to a 100 miles non-stop run in connection with the trials that are being organized by the Automobile Club. The route was from the second milestone past the Marble Arch to the fifty-second one on the road to Oxford, and back. We are pleased to be able to report that the car accomplished the journey without a stop or hitch of any kind in 7 hours 35 minutes, the time being taken by Mr. Swindley, the Club's official timekeeper. Mr. E. J. Coles was at the helm, and accompanying him were two other gentlemen, their total weight aggregating 29 stones 10 lb.

WHEN last heard from, Mr. and Mrs. Davis who started to ride from New York to San Francisco in a motor-car, were somewhere in the neighbourhood Adrian, Mich. The latest news from these plucky but ill-starred travellers was as discouraging as the first. The car was hauled to Adrian for inspection and general repairs. The last recorded speed made by the automobile was twelve miles in four days!

MR. W. J. STAPLES, of Maryville, Mo., has built an experimental petroleum-spirit carriage. Belts are used for transmitting from the motor-shaft to the counter-shaft, tightened by a jockey-pulley. A chain runs from the counter-shaft to the differential. Wood wheels, 36 in. and 32 in. in diameter respectively, are used, 1½-in. solid rubber tires and electric ignition. The maximum speed is twelve miles per hour.

## SCOTTISH NOTES.

**Keep to the Road.**

At Stonehaven, N.B., last week, James W. Garden, motor-car driver, Wellington Road, Aberdeen, was charged with driving a motor-car for at least 120 yards on the footpath of the road between Aberdeen and Stonehaven. Accused said this step on his part was rendered necessary by a horse taking fright at the car. The Bench imposed a fine of 10s., with £1 2s. expenses, or seven days in prison.

**The Edinburgh Motor Postal Van.**

FROM enquiries made this week I learn that the electric van which has been employed by the Edinburgh postal authorities has given satisfaction, and that it is intended shortly to extend the service. The van referred to was built by the Madelvic Motor-Carriage Co., Ltd., of Granton.

**The Weather.**

THE weather in the North recently has reminded chauffeurs that winter is fast approaching, and that soon indulgence in their favourite pastime must be largely curtailed. After some exceptionally stormy days, however, one or two perfectly ideal ones have been thrown in, as it were, for the express purpose of allowing one or two good spins before the roads are in quagmire condition or in the hands of the steam roller. These fine days have largely been taken advantage of by votaries of the pastime, who have enjoyed the exhilarating exercise under conditions of the most pleasing description. There is no such thing as dust to trouble one at this time of the year, and on the days in question a bright October sky and clear, crisp air made an outing truly invigorating. A lady of my acquaintance remarked, after just such a spin, that she infinitely preferred driving at this time of the year to the summer time. The dust at the latter period was simply abominable, she said, and, unless after a shower of rain, she really did not care to go out driving then in any but old clothes. I dare say there is something in this lady's complaint, but the fair sex have yet to learn what is the most appropriate wear for dry, dusty weather, and once they give the matter their attention doubtless something appropriate will be evolved from their imaginative and fertile brains. I have heard many members of the sterner sex growl, too, about the mess they get their clothes in through rapid travelling over dusty roads in summer; but, after all, this is surely a very small matter to make a fuss about, and soap and water are generally available at the end of one's journey. All the same, I have myself been so ingrained with dust on more than one occasion that a bath was absolutely imperative. One soon learns to treat these matters philosophically, however, and wear clothes or overalls which will stand a good "dousing" of dust, and brush easily.

**"Information Wanted."**

AN Edinburgh correspondent, "T. R.," makes some queries in a recent issue regarding a hooded motor-carriage which he saw at Strathpeffer recently, and which he thought ran very sweetly. He was under the impression that it was an electric motor, and expressed a desire to obtain further particulars regarding it. From enquiries made I believe the only electric vehicle in the district mentioned came from Clifton, a shooting-lodge about twelve miles from Strathpeffer, and if my information is correct it came to grief very early in the season. The driver, it appears, ran it off the road, the car turning a somersault and landing, with a boy, at the roadside, where it remained for a fortnight before

it was freed from its ignominious position. The severe shock to the system apparently proved too much for the car, and it has not been seen out since. There were several oil motor-cars running about Strathpeffer and neighbourhood this season, however, and one of them had a hood. These, so far as I could learn, were all Daimlers, and it is very likely that it was one of these your Edinburgh correspondent saw. There is a gradient of about 1 in 16 coming into Strathpeffer, and it is the usual thing when coming down this hill to take out the clutch and run the car out of gear. Were this the case when "T. R." met the car in question it would probably account for its apparent phenomenally quiet running. I was told of one motor-vehicle—a sporting dog-cart—which enjoyed the credit of being the sweetest running car in the district. It was hired for the shooting season by a gentleman from, I believe, the Hiring Co. in Hamilton.

**Another Tourist.**

MR. E. CAMPBELL MUIR, of Inistry, Dalmally, and Ebury Street, London, has been "doing" Scotland well this year with his Grafton-Daimler car. He "motored" from Oban to Glasgow recently, and was very enthusiastic over the good runs he had made. It is only those who, like Mr. Muir, have "done" some of our more popular Scottish routes can speak with authority on the keen delight of traversing mile after mile through the choicest of scenery—mountain, moorland, loch, and pastoral—on a horseless wonder which knows not fatigue.

**A Motor-Van.**

I NOTICED a motor-van in Glasgow the other day belonging to a firm of Hamilton stationers who travel all over the country selling goods and canvassing for orders, and was much struck by the amount of interest it excited. Quite a number of people stopped to look at it, while almost every second person turned round to gaze at the novel sight. I use the word "novel" advisedly, for, strange as it may seem, motor-cars are a comparative novelty in "the second city of the Empire." Beyond the three cars belonging to the curiously-named Mo-Car Syndicate, the only other car in Glasgow is a small motor-bus belonging to the Scottish Co-operative Wholesale Society. Mr. John Anderson, of the Royal Polytechnic, for some time used a motor-car for goods delivery purposes, but I have not seen it on the road lately. Mr. Johnstone and Mr. Murray, of the Mo-Car Syndicate, may often be seen out driving in one or other of their electric or oil motors, but beyond these and the ones already mentioned I do not believe there is a single motor in Glasgow owned by a private individual. The Mo-Car Syndicate booked an order from the Corporation of Glasgow some time ago for an electric dust-cart, but I have not heard anything further of it. Its advent will be awaited with interest, for an electric car of the size required will be a decided novelty.

**Edinburgh.**

EDINBURGH is in a very different position from Glasgow in regard to things automobile, the fleet of eighteen cars belonging to the Edinburgh Auto-Car Co., and which daily ply with full loads of passengers, having made the motor-car a familiar sight in "Auld Reekie."

**The Scottish Club.**

THE movement to form a branch of the Automobile Club of Great Britain in Scotland has, for this year at any rate, apparently died a natural death. Edinburgh autocarists were keen in having the headquarters of the club in Edinburgh, and there was some talk of Eastern chauffeurs making an effort to get the affair carried through, seeing

Glasgow was not in any hurry over the matter; but apparently their zeal has cooled down, too, for another season, for nothing more has been heard of the matter. The number of people interesting themselves in the movement, however, is daily on the increase, and by next year I anticipate that that number will have been so added to that the formation of a Scottish branch of the Automobile Club will be merely a question of another nine months.

**"Motor-Car Accidents."**

MR. C. W. COWAN, Valleyfield, Penicuik, writes to the *Scotsman* on the 5th inst. as follows:—

In the report of the Edinburgh Autocar Company, Ltd., it is stated that there had been no accident during those months. They do not mention that accidents have happened from motor-cars on country roads. I know of two, in one of which, because the driver of the motor took no notice of a signal from the driver of a four-wheeled dog-cart, a lady was pitched from the box-seat over a wall into a field, and the trap damaged. Fortunately the lady escaped with severe bruises, but she might have been killed. Another friend driving in the country had his trap damaged by a motor-car frightening the horse. If traction engines, road rollers, etc., constantly stop and offer assistance to restive horses, why not motor-cars?

To this Mr. Outhwaite, managing director of the Edinburgh Autocar Company, sent the following reply:—

With reference to the letter in your issue of 5th inst., stating that while the cars of the Edinburgh Autocar Company, Ltd., have run over 20,000 miles during the past summer without loss of life or limb to passengers, the drivers of them are directly responsible for two serious accidents to parties in charge of horse-drawn vehicles, permit me to state that most careful inquiries were made in each case referred to, the result of which proved that our drivers were entirely free from all blame, and, moreover, the cars were standing still at the time of both accidents. Our drivers have very special orders to show every consideration to drivers of horse-drawn vehicles, as is only right, but experience has shown that the more our men go out of their way to assist drivers in any difficulty the greater is the abuse showered upon them. I would further point out that our drivers have orders to stop the motor on their car when necessary, although this is not required by law, so that the accusation which you publish to-day can only be the outcome of a biased mind. Both horse and motor have their place, and it is certain that, did the injured parties attach any blame to our drivers, the Company would have been called to account ere this.

This is just the old story of attempting to class carriage accidents as motor-car ones. In all cases automobilists worthy of the name do their best to render assistance to drivers of horse-drawn vehicles when they notice that the animal shows signs of fright, and stop when they are signalled to do so. As has often been said before, in nine cases out of ten the drivers of the traps themselves are more frightened than the horses, and in a great many cases completely upset the animals' nerves by the manner in which they pull at the reins and prepare for a bolt, which in numerous instances the horses never intended making.

"BROWN HEATHER."

A MOTOR-CAR has been put in service between St. Peter's Church and Trent Bridge, Nottingham. The car makes a journey every quarter of an hour, and carries an average of ten passengers at 3d. a head.

A MOVEMENT is on foot to organize a large motor-car exhibition in New York. It is considered that the organization of such a show would be one of the best means to help American manufacturers to get ready for the Paris Exhibition, and that the most opportune time for holding it would be in February next.

MESSRS. FRIEDHEIM & Co., of 34 Amhurst Road, London, N.E., the agents in this country for Messrs. Zimmermann, Knauth, & Co., of Kappel, Chemnitz, Saxony, have sent out a copy of their catalogue of cycle and other lamps. Glancing over the list we find illustrations of a neat form of acetylene lamp specially designed for motor-cars. Those automobilists in need of such accessories would do well to enquire further into the merits of the "Saxonia" lamps.

**THE ALLARD LIGHT MOTOR-CAR.**

—88—

OUR Midland correspondent, "Hercules," referred last week to the new light motor-car which has just been brought out by Messrs. Allard & Co., Ltd., of Earlsdon, Coventry. We are now able to give an illustration of the new vehicle, which takes the form of a two-seated *vis-à-vis* or *tête-à-tête*, as the firm term it. The motor is of the vertical type, of 2½ h.p., with radial discs for cooling purposes. The ignition is electrical, while the carburettor is of the Longuemare type. The motor is geared to the rear axle

through the medium of a Didier two-speed gear, which, aided by the variations possible with the electric ignition device, gives a wide range of speeds. The road wheels are of the cycle type, fitted with pneumatic tires. The body is suspended on the frame by means of compass springs at the front and C springs at the rear. The little car is about 42 in. wide, and weighs only 5 cwt. "Hercules" has already had a trial trip on the car, and expresses himself satisfied with its hill-climbing capabilities, Gibbett Hill being mounted at a speed of between nine and ten miles per hour.

A NEW motor-bicycle is, we hear, about to be put on the market by Messrs. Ambrose Shaw & Sons, of the Gazelle Cycle Works, Crawley.

LA SOCIÉTÉ DES MOTEURS ROTATIFS (Arnaud & Marot) is the style of a new firm which has just been formed in Paris (155 Boulevard Malesherbes) with a capital of £8,000.

THE United States Consul at Shanghai regards that place as eminently suitable for motor-vehicles, more particularly as the present locomotion is entirely by means of horses.

AN enterprising grocer in a northern town advertises "motor tea," and in sending this information a correspondent asks if it is of China, Scotch, or Irish origin. We know not.

THE Automobile Carriage Co. has been organized at Amesbury, Mass., by a number of well-known carriage builders, with a capital of £30,000. The motive power of the vehicles will be electricity.

WE have received from Messrs. Brampton Bros., Ltd., of Birmingham, a large chart giving particulars and illustrations of the many sizes of block and roller chains they manufacture for use on motor-vehicles. The chart not only gives the various pitches and breaking loads of the chains but also the dimensions of the blocks and rollers in the same, and should be found useful for reference purposes by all interested in the manufacture, sale, or repair of motor-vehicles.

## MIDLAND MOTOR NOTES.

By "HERCULES."

Motor-Cars  
in Leicester.

LEICESTER, one of the most progressive of Midland towns, is keenly alive to the great utility of the motor-car. The conversion is all the more gratifying because it is based on practical experience. A few months ago the motor-car, when first introduced there, was looked upon as the playful hobby of a few gentlemen, and found little favour; to-day, after practical experience of its claims and capabilities, it is considered the safest, most comfortable, and best means of locomotion for the conveyance of passengers in the town. The first cars were introduced in April of this year, when a few gentlemen developed the business of what is known as the Leicester Motor-Car Company, Ltd., to test by experience the running of motor-cars for public use. Subsequent results have conclusively proved that they were justified in their anticipations. The success which has attended the service they established has been phenomenal, and there is every reason to believe that in the near future this success can even be improved upon. From the experience of the Company's working the weekly cost per car for storage, oil, petrol and driver has amounted to £3 5s., while the average weekly earnings of each car has been £10, which leaves for depreciation, repairs and renewals, and other incidental expenses, reserve fund and dividends, £6 15s. per car per week. These facts have been duly testified to by a chartered accountant with the view to the flotation of a company with a share capital of £30,000. When this has been accomplished it is proposed to purchase several more cars, and make the service a much more extended one. These particulars are sufficient to show that the motor-car has come to stay in Leicester.

Motor-Cycling  
in  
Coventry.

MR. GEORGE DU CROS, of the Dunlop Tyre Co., Coventry, was the defendant in a motor case at the Coventry Police-Court on Thursday last week. Mr. Du Cros is a motorist, and when riding through one of the streets of the city of spires he suddenly became aware that the driver of a vehicle coming in the opposite direction was signalling him to stop. Mr. Du Cros did not attend the court in person, but was represented by a solicitor, who informed the Bench that his client did not notice the gentleman signalling to him until he was within twenty yards. As the street was on the decline and the surface very greasy at the time, he was unable to stop the tricycle until he was close to the horse and vehicle. The driver of the vehicle, a licensed victualler residing in the city, complained that Mr. Du Cros did not pull up so quickly as he ought to have done, and informed the court that he was signalling for some time before defendant attempted to stop. Regret was expressed that Mr. Du Cros had not complied more closely with the requirements of the Act, and the Bench, in fining him 10s. and costs, pointed out that it was essential motorists should be on the alert for requests made by drivers of restless horses.

The First  
Case.

THIS was the first case of the kind in Coventry, and considering the number of motors which pass through the streets it speaks well for motorists that such a long time should have passed since the Act was put into operation without any action against them having been taken. In this case one wonders why a summons was taken out. The complainant was a private individual, and no evidence was given to show that Mr. Du Cros sought to set the law at

defiance. His error was in not seeing the driver signalling the moment he put his hand up; when he did become aware that someone desired him to stop he did all he could to comply with the request. Consequently there seemed little reason for dragging the case into the police-court. Mr. Du Cros is regarded as a very careful and experienced driver, and an apology for not "complying more closely with the requirements of the Act" should have satisfied the owner of the horse.

## A Warning.

THE case will doubtless serve as a warning in the district, and motorists will no doubt be on the *qui vive* for restless horses and the demands to stop. Such demands are not always made with the best grace; some drivers are apt to think that no one else is entitled to the road but themselves, and look upon a motor-car with special aversion. If they can put the driver of the "light locomotive" to any trouble they will do so; they are, they are proud to say, masters of the situation: they have only to put up their hand, and the motorist must stop. No driver of any type of automobile wishes to cause a horse to prance about the road just for "the fun of the thing," and as far as I know they are only anxious to meet with the desires of drivers whose horses have not yet become accustomed to the new mode of locomotion. On the other hand, drivers should be equally considerate, and not call upon motorists to stop when there is no reason for so doing.

A Hint to  
Drivers  
of Horses.

WASN'T the fine in the case referred to a trifle "stiffer" than was required by the circumstances? It was the first case of the sort; no complaints had been previously made against the defendant; the non-stopping was evidently not intentional; and yet the defendant had to pay 10s. fine and perhaps twice as much in costs. One can't help comparing the amount with the fines inflicted upon drivers who have been convicted of furious driving, or who have bored a cyclist on to the kerb, or who have been asleep or too far off their horses to have any control over them. These cases are constantly occurring. No one would say that motorists or cyclists are perfect, but they surely cannot be worse offenders, and cannot endanger public safety to a greater extent, than a horse and vehicle in the hands of a careless or reckless driver. Mr. Onativia, of Kenilworth, who is well known in the motor world, will bear this statement out, for his brougham was simply wrecked the other night when driving along the Coventry and Kenilworth Road.

The  
"Princess" Car.

THE Motor Manufacturing Company, Coventry, are experiencing the truth of the old saw, "Nothing succeeds like success." They are experiencing a gratifying demand for their "Princess" car, and have been compelled to increase the number of their employés and work at full pressure. The results are very satisfactory, and cars are being turned out with the greatest expedition which the best workmanship and care for details permit. Except tires, everything required in motor-car construction is made on the premises, and a visit to the works the other morning proved highly interesting, especially the wheel-building, joinery and coach-building departments.

Motoring Visitors  
to Coventry.

LAST week Coventry was favoured with distinguished motorists in the persons of Sir Francis and Lady Jeune, who have been making a motor-car tour in the district. They stayed at the King's Head Hotel in Coventry, and made daily excursions to the many historical places of interest in the neighbourhood.

**A New Motor-Car Company.**

STILL they come! The Melbourne Carriage, Motor and Cycle Co., Ltd., of Green Land, Wolverhampton, have now started in the motor manufacturing industry. This is an amalgamation of the firms of Allan & Summerfield, cycle makers, and Beech & Onions, carriage builders.

**The "Star" Car.**

MR. LISLE, of the Star Cycle Co., Ltd., Wolverhampton, asked me a few days ago to accompany him on a trial run of one of their motor-cars. I consented, and spent a very pleasant time, thoroughly enjoying the ride and appreciating the enervating and exhilarating influences of the bright sunshine and crisp air as we glided easily and smoothly along. I was impressed at the comfortable motion of the car and the ease with which it was controlled. The speed capabilities of the vehicle were also tested, and once or twice we seemed to fairly fly. Had not such a thoroughly experienced driver as Mr. Lisle been at the helm I might have been alarmed, but as it was I soon became accustomed to the rapid motion. There is no mistake about it, motoring has only to be experienced a few times for one to grow enthusiastic in the sport. I may add that the management of the car is exceedingly simple, and a short time sufficed to grasp the theory of its control, which seems to be perfect. On the same day I had a run over the firm's premises, and was astonished at the large number of cars in course of construction. Some had been but recently commenced, whilst others were being painted, and upholstered with handsome cushions.

**The Wearwell Car.**

I HAD a chat the other day with Mr. Clarke, of the Wearwell Cycle Co., and gather that he is most sanguine as to the success which this Company's motor-cars will achieve. They will, he believes, prove to be amongst the fastest and lightest on the market. The cars will be fitted with duplex engines, which can be used singly or jointly as desired.

**A Motor-'Bus Service for Wolverhampton.**

A REMARK in a previous issue of this journal regarding a service of motor-'buses for Wolverhampton seems likely to bear fruit ere long. I understand that the matter was discussed a few days ago at a private meeting of a number of gentlemen, and that it was decided to ascertain the prices of vehicles suitable for the purpose, and other information bearing upon the subject. I feel confident that when these gentlemen learn the success with which similar services are being run in other towns they will have no hesitation in following suit. Publicity of the fact that the matter is under contemplation is only necessary, I feel sure, to lead many others to interest themselves in what is believed would prove not only a boon to the town, but also a most successful venture.

**More Eadie Specialities.**

THE Eadie Manufacturing Co., of Redditch, are now, we learn, prepared to supply to the trade motor axles, bridges, and balance gears. The Company have arranged to make the components in question in extensive quantities, so that firms who purchase from them will save loss of time and much expenditure by taking advantage of the product of a large and specialised, and therefore economical, output.

THE Ariel Cycle Co., Ltd., Birmingham, have now introduced a 2½-h.p. motor quadricycle convertible to a tricycle.

**CORRESPONDENCE.**

**THE FAULTS OF MOTOR-TRICYCLES.**

TO THE EDITOR OF *The Motor-Car Journal*.

SIR,—I intend going in for a motor-tricycle, and want to learn all the details of the motor and electric ignition, so that I can use the machine with confidence after a little practice.

Will you assist me in advising the best way to learn, as I am perfectly ignorant of both, but with a little clear explanation of the working, etc., I shall get over it. What book is there published, and what are the bad points in a motor-tricycle? When I used to drive I always requested to be told the faults of a horse. When one knows these he is more master at once; and there must be some drawbacks to a motor-tricycle. Thanking you in anticipation,

Wotton,

October 10th, 1899.

Yours truly,

G. D. H.

[Our correspondent would do well to place himself in communication with the firms now manufacturing and vending motor-tricycles. They will, we feel sure, be only too pleased to afford him full information and every facility possible.—ED. M.-C. J.]

**TOLL CHARGES FOR MOTOR-TRICYCLES.**

TO THE EDITOR OF *The Motor-Car Journal*.

SIR,—In riding a motor-tricycle, I find in certain parts of the country, and notably on several bridges over the Thames, that toll keepers try to exact various sums varying from 6d. to 1s. 6d. from me for passing through. On looking at the scale of charges exhibited on the board, the description runs: "For every description of steam or other machinery-propelled carriage, 1s. 6d.," and no mention whatever is made of a motor-cycle. I invariably refuse to pay, and make sure always when approaching the gates to propel the machine by the pedals only. I, in common with no doubt many other motor-tricyclists, should be pleased to know whether this tax can be legally enforced, more especially as no charge is made to pedestrians and riders of the bicycle and tricycle without motor attached.

15A Baker Street,  
Portman Square.

October 11th, 1899.

Yours faithfully,

EDWIN S. CHEEL.

**THE CINEMATOGRAPH ON TOUR WITH A MOTOR-CAR.**

TO THE EDITOR OF *The Motor-Car Journal*.

SIR,—What a difficult matter it seems to be to obtain reliable information as to the state of the roads, even from the people who have lived all their lives in the vicinity of the same, and who, moreover, are constantly travelling over them. This I have proved on more than one occasion, and especially so last week. In a journey from Orton to Appleby, Westmoreland, there was a choice of two routes, one over Orton Scar, and the other a longer route *via* Kirkby Stephen. Both it was agreed on all hands were very bad roads, but which was the better was what I wanted to know, and despite the most persistent enquiries I could not get any definite answer. I had to decide myself, and as if by a spirit of obstinacy selected the one which at the start at all events presented the greatest difficulties. We elected to climb Orton Scar, and this we accomplished safely. We had an early start—7.30 a.m.—and on reaching the summit of the Scar were rewarded with a magnificent view. A bank of light fog, stretching apparently for miles, lay at our feet, and the tops of the surrounding mountains peeped out here and there like islands in a big lake. This sight alone was worth a greater effort than we had to make to take our car up Orton Scar. The road thence to Appleby was indeed very rough. We, however, reached Appleby at 9.15, just one hour and three-quarters for fourteen miles—not so bad when one considers the heavy load we carry. On arrival at

Appleby I found an urgent summons awaiting me to proceed to Edinburgh. This I was compelled to attend to, and so for the balance of the week's tour to Warcop, Brough, and Kirkby Stephen, Mr. Sinclair and Mr. Lax had it entirely to themselves. On my return they reported no incident and all well, so that this letter will be void of any such exciting experience as noted in my last. Next week we are to visit several of the highly-situated towns in the Teesdale district, most of which, from what I can gather, have never yet had a motor-car in their midst, so we naturally anticipate a good reception, the result of which I will let you know in due course.

I am,

Yours, etc.,

T. J. WEST,

Manager of the Modern Marvel  
Co. (Ltd.), of Edinburgh.

Kirkby Stephen,  
October 11th, 1899.

### SOME QUESTIONS REGARDING THE DE DION MOTOR-TRICYCLE.

TO THE EDITOR OF *The Motor-Car Journal*.

SIR,—I am surprised that none of your motor-cyclist readers have taken the trouble to reply to Mr. Shardlow's queries in your issue of September 29th. I will endeavour to do so to the best of my ability.

(1.) The dry battery of a De Dion tricycle certainly should not give out after a mileage of only 550. The makers claim for them a maximum of 200 hours continuous running, i.e., about 2,400 miles. I have run nearly 1,800 miles with my present battery, which still gives a good spark. Is Mr. Shardlow sure that before the machine came into his hands the contact plug had not been carelessly left in after using?

(2.) A French dry battery (the same as supplied by the De Dion firm) can be obtained through the British Motor Co., 40 Holborn Viaduct, at 35s.; it gives about five amperes when new. I saw recently at the offices of the London Autocar Co., 183 Gray's Inn Road, W.C., an English 4-cell battery made to fit the De Dion case, listed at only 16s. 2d. I have not tried this, but should think it quite worth a trial at the price. This is said to give eleven amperes.

(3.) The machine with thirteen teeth in the pinion wheel is a medium gear, and the makers do not claim that it can climb any hill. If Mr. Shardlow is a heavyweight, why does he not convert it to the low gear, with 11 and 106 teeth? These gear-wheels could be obtained from either of the above firms for about 30s. I ride a low gear, and in this hilly district I find it faster than the medium. The 2½-h.p. motor made by the Motor Mfg. Co. is said to fit a De Dion frame, but I do not know if much more power can be got from it, and it would certainly be more difficult to keep cool. These air-cooled motors quickly lose their compression, and then their hill work is poor; the valves, piston rings and joints should be carefully adjusted and tested. I can only say that my machine does its work admirably, and that I find it invaluable.

Ringmore, Teignmouth,  
October 10th, 1899.

Yours truly,  
W. E. TESCHEMAKER.

THE Perfect Compound Kerosene Gas and Compressed Air Automobile Fire Engine and Motor Manufacturing Company is the somewhat lengthy name of a company which has just been formed at Hoboken, N.J., with a capital of £100,000, to manufacture automobile fire engines and motor-vehicles.

THE Automobile Exchange, an emporium and training school, has been opened at 213 West Fifty-Eighth Street, New York. Vehicles propelled by different motive powers will be kept in service, and competent teachers and repairers will always be ready to instruct the novice or put vehicles in order. Courses will consist of five or ten lessons, and charges for vehicles and instruction will be made by the hour.

## A RACE AND A TOUR IN THE SOUTH OF FRANCE.

—❦—

THE race was from Bordeaux to Biarritz, and the gentlemen responsible for its arrangement were M. Felix Mouren, Mayor of Biarritz; M. le Docteur Cr<sup>eu</sup>zan, M. Despaur, M. Rene Marman, M. le Marquis de Vivier, and M. le Baron du Barry. The judges were the Marquis de San Carlos and other prominent noblemen.

The racing was divided into classes. In the class for 6 h.p. and more the Hon. C. S. Rolls competed. Another English gentleman, Mr. C. L. Barrow, a resident of Biarritz, also competed in this class. The Hon. C. S. Rolls drove his 8-h.p. Panhard car and Mr. Barrow an elegant De Dietrich car. The start was made at Bordeaux, but Rolls' car had not proceeded more than 10 kilometres when a chain jumped the wheels. The only observation by the occupants of the car was "chain off." They rapidly alighted, and soon replaced it, and again started. However, after travelling a further 20 kilometres "that chain" jumped off again, but it was again rapidly replaced and the tension rol adjusted. Some of the roads were worn and lumpy, but on the whole they were superior to English roads. At Largon, Mr. C. L. Barrow and M. Calvert were respectively first and second, and Rolls—owing to his two accidents—third. At Auros, good work by Rolls had gained him second place, with Mr. Barrow still first. The merry hum of the engines inspired everyone with confidence, and at Grignols Rolls' car passed Barrow's, and was first to arrive at Casteljaloux. From there to Mont-de-Marsan the lead was gradually increased, and the first day's run of 176 kilometres was done in 4 hours 13 minutes.

After arriving at Mont-de-Marsan the engine suddenly turned stupid, and it was found that the governors were acting quite too energetically and preventing the engines from running properly. Rolls was not the man to sit down and weep, and promptly set to work to remedy the defect which ultimately ended in disconnecting the governor spindle and connecting the "cut outs" with wire to be used when necessary, and although this misfortune was not temporarily adjusted until the night and early morning had been spent in unwearying toil, the reward was at hand and ended next day in victory for the car.

The next day broke with a bright morning, and the start from Mont-de-Marsan was made at 11.38. After a splendid run through the pine forests, Saint Paul le Dux was reached at 1.15, and the journey was continued without interruption to Bayonne which was reached at 2.23.

Shortly after, the arrival of the car at Biarritz was signalled by the firing of two guns, and the Englishman's car had won the race by 27 minutes. The average speed for the two days run was over 27 miles an hour, including stoppages.

It was a delightful trip, the long, straight roads through the pine forests adding greatly to the enjoyment. Everybody made way for the automobile except two dogs, which committed suicide in a zealous and determined endeavour to throw the car off the road. An interesting feature of the roads in Southern France is the numerous yokes of oxen, which seem to have better sense than most cattle, for they regard the automobile with a look of silent admiration; and throughout the race and subsequent tour there was only one horse that had the bad taste to make a fuss. This is easily accounted for from the fact that Frenchmen are good horsemen, and when a horse shows signs of unrest or fright they treat it properly. Ninety-nine out of every hundred Englishmen (who think that holding two strips of leather and a whip, with plenty of use of the latter, constitutes horsemanship) commence to flog a horse when it shows signs of unrest, which only forces the poor animal into a state of fear, and increased danger on a recurrence of the circumstances which raised its curiosity.

While speaking of animals it should be mentioned that the mules seem particularly sensitive and apprehensive of danger from automobiles. But what can you expect of a

mule? But to return to the subject of the race. The Mayor and authorities at Biarritz had fenced off the grand esplanade and made a fine enclosure for the automobiles. The reserved portion was thronged with a fashionable crowd of visitors and residents, and the utmost enthusiasm was shown on all hands.

A grand reception was given by the Mayor in the evening, and a large assembly of automobilists took place under the most happy circumstances. A stay in Biarritz until Wednesday was eventful, as many prominent automobilists were there, among whom were Prince Orloff, Marquis de Tovar, and Mr. C. L. Barrow, who, with the Marquis de San Carlos de Pedrosa, presented the Cup, which the Hon. C. S. Rolls had the satisfaction of bringing back to England with him.

A start was made on Wednesday morning from Biarritz, and the run for that day included Bayonne and the other places passed on the day of the race, and a halt was made for lunch at Mont-de-Marsan. After lunch a start was called for Bordeaux. The darkness, however, came on suddenly, and as it was very dangerous travelling through the deep pine forests, and uncomfortable in consequence of the heavy downfall of rain, a halt was made at Langon, having run nearly 200 miles. There was only one hotel in the place, which was not exactly like the Grand Hotel at Paris or the Savoy in London, but the people were very anxious to do the best they could for the comfort of their guests. The next morning at breakfast we had some delicious peaches and strawberries grown in the garden of the hotel.

A start was made next day at 11, and Bordeaux was reached before lunch, when it was discovered that one of the brakes had given way, and upon examination it proved that two of the pinions had dropped out, although these had been recently put in on fixing new brakes at Charron's works at Paris. The car was taken to an engineer's place who advertised as an automobilist, and after some few minutes' conversation with the principal, a fine, handsome man, he politely intimated he spoke a *little* English. When he began to speak English his dialect was distinctly Lancashire, and he turned out to be a native of Preston. He had very competent workmen, who effected the necessary repairs in a very short time. Once more—at 3.30—the journey north was resumed, through Libourne, St. Denis de Piles, Barbezieux, Petignac, and Angouleme, where, as time was pressing and both the voyagers on the car were due in London on Saturday, the journey to Paris was resumed by train. The civility, courtesy, and appreciation of automobilists is a great feature in France, no matter what district one is in, and a very enjoyable tour will long be remembered by those who took part in it.

THE Lanchester Motor Company, recently organized under the laws of New Jersey, proposes to erect a factory in Pittsburg, to employ about 600 hands.

"OWNERS of horses" says the *London Letter* "should take every opportunity of accustoming their steeds to the sight of the new phenomenon of the roads." Quite so.

AN automobile cab company organized in Portland, Me., recently intends not only to do a local business, but also to take passengers up through the White Mountains. The vehicles for the latter traffic will, according to an American contemporary, probably be tally-ho coaches capable of holding ten persons.

At a meeting of the Kesteven Standing Joint Committee at Grantham this week, Captain Bicknell (chief constable) reported that there was a certain amount of bicycle racing on the highways in the district, and he was doing his very best to put it down. He hoped the magistrates would impose the heaviest fine they could, and that in cases where the defendants did not appear warrants would be issued. The committee approved of the action he was taking.

## THE VALLÉE RACING CAR.

WE are now able to give a brief description, with illustrations, of the special racing car constructed by M. Vallée, of Le Mans, France, and ridden by "Flash" (Dr. Lehweß) in the recent Paris-Saint Malo and Paris-Ostend races. There are quite a number of

FIG. 1.—GENERAL VIEW OF THE VALLÉE 16-H.P. RACING CAR.

special features in the car, the main ones of which are the total absence of driving chains and variable speed gear. The motor is a four-cylinder one of 16 h.p., and is located in the front portion of the car; it is provided with a water-jacket, a governor, and electrical ignition. The power of the motor is transmitted directly to the rear road axle by a single wide

FIG. 2.—ELEVATION.

belt *G* working on the pulleys *H H'*; there is thus no mechanical variable speed gear provided, it being by means of the control of the motor that the different speeds are obtained. The governor with which the motor is equipped

FIG. 3.—PLAN.

permits the latter to run at its normal speed on open country roads; in riding through traffic, etc., the motor can be instantly slowed down by pressing the pedal *B*, which prevents the opening of the exhaust valves, and consequently stops the admission of fresh explosive charges. Furthermore,

the speed of the motor can be additionally varied by means of the electrical ignition device. In providing the car with a four-cylinder motor, the makers claim that not only can the car go at a high speed on the level, but that it can mount any hill at a good pace without any mechanical hill-climbing gear being necessary; in fact, they claim that not only is a simpler arrangement obtained but that also a saving in weight is effected, the supplementary two cylinders weighing less than the usual variable speed gear and its accessories. The pistons are connected to the crank-shaft in such a way that the latter receives two impulses at every revolution of the fly-wheel. The motor can, it is stated, be slowed down to a speed of only fifty revolutions per minute without it coming to a standstill.

Referring to the diagrammatic illustrations (Figs. 2 and 3), *A* is a box containing the governor and sparking gear. The carburettor is located at *I* in front; on the pipe which connects it with the motor is fitted the mixing valve, controlled by the handle *F* on the steering standard. The frame of the car is entirely constructed of steel tubing. The belt pulley *H* surrounds the differential gear *K*, while inside the pulley is a backward motion device controlled by the handle *E*. A hand brake, actuated by the foot pedal *C*, is arranged to be brought into contact with the inside of the pulley *H*. The driving belt is made of special waterproof material, so that it is unaffected by rain, or splashes during the washing of the vehicle; it is also of an unusually wide width. The rear axle is supported in a special manner, it having a slight forward and backward movement, which is controlled by the handle *D*. By means of this arrangement the full tension of the driving belt can be maintained, and, if necessary, can be slackened, thus permitting a further variation of the speed of the vehicle, and, in fact, serving somewhat the purpose of a friction clutch by preventing the power of the motor being transmitted to the rear axle in case of emergency. In addition to the hand brake inside the pulley *H*, the manœuvring of the handle *D* to slacken the driving belt also brings into action a shoe brake *L* on to the face of the pulley, between the upper and lower portions of the belt.

Although "Flash" was unfortunate in the Paris-Ostend and Paris-Saint Malo races when he drove the car above described, yet he attained with it an average speed of from 40 to 42 kilometres per hour.

We learn that the construction of motor-cycles is being taken up by the Riley Cycle Co., Coventry. The types they are about to turn out are tricycles and quadricycles fitted with De Dion motors.

THE annual general meeting of the Liverpool Self-Propelled Traffic Association will be held on Monday next, the 16th inst., in the Council Room of the Liverpool Chamber of Commerce, B 10 Exchange Buildings, at 12.30 p.m., when the report of the Council will be presented.

THE first number of the *Automobile Magazine*, issued by the United States Industrial Publishing Company, of New York, for October, contains a well written and profusely illustrated article on the recent automobile craze at Newport by Edwin Emerson, jun. Baudry De Saunier, one of the founders of the Automobile Club in France, contributes an article describing the origin and subsequent progress of this club. An entertaining article is Sylvester Baxter's feeling plaint on "How the Horse Runs Amuck," aptly illustrated by one of F. C. Atwood's laughable drawings. The seriousness of the subjects discussed in the technical section is lightened by a special department containing reproductions of the most amusing drawings of automobiles and automobilists published in the leading comical papers of Europe.

## THE McLACHLAN HEAVY OIL MOTOR.

THE accompanying illustration shows the McLachlan horizontal petroleum motor. The makers—the E. A. McLachlan Engine Co., of 14 Holborn Viaduct, E.C.—claim to have produced a heavy oil engine that is in every way a success, the fuel used being ordinary paraffin. The motor is made in both vertical and horizontal forms, and in a variety of sizes ranging from 2½ h.p. up to 7 h.p. For motor-cycles or light cars the Company recommend their vertical engines, Nos. 1 and 5, of 2½ and 2¾ h.p. respectively, which are of the well-known De Dion type. No carburettor is necessary; the oil is supplied by gravitation and is at once vaporized, giving exceptional power to the explosions. The horizontal engines work on the same method, and are made from 2¾ to 7 h.p., with either single or double cylinders according to the power of the engine desired. The driving-weight capacity of the largest size of this pattern engine is one ton. The cost of running these engines is described as being purely nominal, and to drive the above weight the consumption of oil would be about three pints of paraffin per hour (which can be bought at 6d. per gallon), or less than 3d. for one hour's work.

The McLachlan Co. claim that there is hardly any noticeable smell with these heavy oil engines—in fact, none when the car is running—and owing to the special method of vaporising there is no clogging in the cylinder. Simplicity is another feature of these engines, there being only two valves: an automatic admission valve and an exhaust valve controlled by a rocking arm actuated from a small cam shaft. The motor can be fitted with either electric or tube ignition as desired.

In addition to the above engines the McLachlan Co. are manufacturing specialties in electric plants complete, suitable for recharging accumulators, lighting, etc. One of their special lines for country shops is a heavy oil motor-engine and dynamo fixed upon an iron bed 6 ft. long by 2 ft. broad. The plant is capable of lighting up a shop or house with fourteen or sixteen incandescent lights of 16 c.p., or for recharging. The engine runs at 1,500 revolutions per minute; the dynamo giving out 60 volts and from 18 to 20 amperes. The weight of this special outfit is about 11 cwt.

THE *Church Family Newspaper* has an interesting interview with a member of the Automobile Club in which the claims of motor-cars to public consideration and confidence are well brought out.

MESSRS. J. G. & B. S. FERGUSON, bakers, of Boston, Mass., are contemplating the change of their entire delivery service from horses to motors. They have an electric delivery van already in use, and a steam wagon is being built for them.

## THE LAMPLUGH MOTOR-CYCLE SADDLE.

WE illustrate herewith the new motor-cycle saddle which is being put on the market by Messrs. Lamplugh & Co., of 67 Aldersgate Street, London, E.C. The saddle measures 10½ in. across at the broadest part and 10½ in. in length. The cover is made in one piece of leather, and is lined with felt, which encloses the cushions.

The cover is placed over the webbing and riveted on to the frame. As all the support is taken from the webbing the leather is not under tension. The system of webbing-tension, shown in the second illustration gives, it is claimed, a perfectly firm yet flexible support, and the tension is equally distributed. This webbing does not stretch like leather, and, if necessary, it can be re-tensioned by means of the screw in front of the saddle. The springs screw into sheet

metal loops, which are made in the cantle for the purpose. For motor saddles this is claimed as an advantage, as it prevents any chance of the saddle becoming detached from the frame through the nuts loosening. The clip is made of sheet steel, and has two double-grooved surfaces, which prevent the saddle moving out of position after being once screwed up. At the same time it allows of a very close adjustment in tilting.

ACCORDING to New York advices, Mr. A. H. Overman, of the Overman Wheel Company, has started for Europe. He is bringing with him an automobile of the latest model produced by this Company, and will be away indefinitely on business connected with it.

L'AGENCE INDUSTRIELLE D'AUTOMOBILES (Corre, Directeur), 54 Rue de Villiers, Levallois-Perret (Seine), have sent us a copy of their abridged price list, which gives particulars of the Corre motor-tricycles and quadricycles (De Dion motor), De Dion and Renault voituresses, Peugeot cars, etc.

At Coventry, on the 5th inst., Mr. George Du Cros, of the Dunlop Tyre Company, was summoned for neglecting to stop a motor-tricycle he was driving in the city when signalled by the driver of a restless horse. Defendant did not appear, but apologised through his solicitor. The magistrates fined him 10s. and expenses.

WE understand, says the *Kent Argus*, that at an early date the Auto-Motor Express Co., Ltd., will run its first car about the streets of Ramsgate. The Company, after examining a great many different models, have decided that the steam omnibus brought out by Messrs. Coulthard & Co., of Preston, is the most suitable for local requirements.

EARLY on Tuesday morning, as Messrs. Spiers & Pond's steam van was proceeding towards the city depot of the firm along Blackfriars Road, the car became fixed close to the kerb. The driver tried to extricate it, when, according to the daily papers, the steam-pipe burst. The driver was scalded in trying to close the valve, but a further explosion was prevented.

## MINDING A MOTOR-CAR.

MR. CHARLES FRISWELL, of 18 Holborn Viaduct, E.C., was summoned at the City Summons Court on Friday last week for causing a light locomotive to be used on the highway, there not being in charge of the same a person competent to control and direct its use and management. Police-Constable Jenkinson, 454, deposed to finding a motor-car in Moorgate Street with an obstructive crowd round it. He found a boy of thirteen in charge of it, who said he could not manage it. After waiting eight minutes defendant, the owner, came up, and, in answer to witness, said he left the boy to mind it. Defendant said it was an electric motor-vehicle, and the machinery could not have moved while he was away, as he took the key, but it could have been pushed out of the way. There was no danger of it running away. Alderman Samuel Green fined defendant £1 and costs.

## ANOTHER FURIOUS DRIVING CASE.

EDWARD CHILVERS, a motor-car driver, in the employ of Mr. F. Morris, of Lynn, was summoned to Rollesby Petty Sessions last week for furiously driving one of those conveyances at Ormesby. Mr. Clowes prosecuted on behalf of the Cabmen's Protection Association, and Mr. G. H. Lovewell Blake defended. Witnesses gave evidence to the effect that the motor-car was being driven from Yarmouth in the afternoon, when it overtook a cab driven by Edward Bunting, of Yarmouth, and in passing the back hub of the motor-car struck the front wheel of the cab, throwing the horse down. Fined £1 and costs.

## LONDON ELECTRICAL CAB COMPANY, LIMITED.

IN a motion before Mr. Justice Darling on Wednesday last week (London Electrical Cab Company, Limited, v. Bersey) an application was granted, by consent, for an order for the appointment of a receiver with power to act at once. Counsel stated that the gentleman appointed was one who had been selected by the debenture-holders.

## THE NEWCASTLE-UPON-TYNE AND DISTRICT MOTOR-CAR COMPANY, LIMITED.

THE statutory meeting of the shareholders of this Company was held on Monday, Councillor Jacob Daglish, the chairman of the Board, presiding. The Chairman said that the Company was registered on June 10th, 1899. The prospectus was issued on August 3rd, and the Company had practically been formed some two months. The cars were first started at Tynemouth, where the traffic was less than in Newcastle, thus gaining experience both for drivers (who were difficult to get at first) and others. The Company was singularly fortunate in securing the services of Mr. Allison, of Sunderland, as manager, and with an efficient staff the Company is practically able to do the whole of its own repairs. The directors have entered into an arrangement with Mr. Slater for 500 square yards of ground off Barras Bridge, and the Company will erect thereon a corrugated iron building suitable for twenty-five to thirty cars, as well as repairing shops, etc. This is expected to be finished in about two months. The Company received two new cars last week, and two more are due to arrive this week, and so far the two received have given every satisfaction. The directors are satisfied that the demand for motor-cars in Newcastle is increasing. More capital will probably be asked for to purchase cars, as the establishment charges would not be increased by the addition of ten more cars. Mr. S. Benson moved, and Mr. Watson seconded, the re-election of the present directors, who retired according to the articles of association. The meeting concluded with a vote of thanks to the directors.

## HEAVY FINE FOR "SCORCHING."

At Norman Cross, on Tuesday, Mr. J. W. Stocks, of the Ariel Cycle Works, Birmingham, was fined £8 and costs for furiously driving a motor-tricycle on the Great North Road near Peterborough. Superintendent Allen said that Mr. Stocks was pacing a man on a bicycle, and was going at a speed of twenty miles an hour. The magistrates said they were determined to prevent the roads being turned into racecourses.

At the last meeting of the Dover Town Council, an application for a licence for another (the third) steam motor-bus was made by the East Kent Motor-Bus Co., and was referred to the Surveyor for report.

A NEW English-made sparking plug has lately been designed and is being manufactured by Mr. Frank F. Wellington, of 36 St. George's Square, Regent's Park, N.W. As Mr. Wellington has had nine years' experience with porcelain tubes, the new device ought to be a reliable ignition plug. The price is, we understand, very low.

## SALES, WANTS, Etc.

[All Advertisements under this heading will be inserted at the minimum rate of 1s. 6d. for 18 words and thereafter at the rate of 1d. per word per insertion, but on no account will any Advertisement be inserted unless prepaid.]

**FRENCH RACING BOLLÉE**, only been run three months, 4 h.p., geared very high, splendid hill-climber, to seat two persons, front seat detachable; price £70.—Apply, Frank F. Wellington, 36 St. George's Square, Regent's Park, N.W.

**BENZ INTERNATIONAL**, to carry three, beautifully upholstered, very powerful, all latest improvements, in grand order; price £120.—Apply, Frank F. Wellington, as above.

**MOTOR-QUADRICYCLE**, interchangeable to Tricycle, by De Dion and Bouton, very little used, exceptional bargain, in grand running order; price £67 10s.—Apply, Frank F. Wellington, as above.

**MOTOR-WAGONETTE** by Daimler, 5½ h.p., grand carriage, in perfect condition, new tires, repainted and upholstered, to carry four or six, free trials to buyers; price £265.—Apply, Frank F. Wellington, as above.

**MOTOR-WAGONETTE** by Daimler, 5½ h.p., to carry eight passengers besides driver, geared low for hill-climbing, suitable for passenger service, in perfect running order, hardly been used; price £265.—Apply, Frank F. Wellington, as above.

**MORS CAR**, very fast, splendid condition, 8 h.p., to carry six persons; price £250.—Apply, Frank F. Wellington, as above.

**1½ H.P. DE DION TRICYCLES** (two), electric ignition, in first-class order, £34; also Werner Bicycle, in running order, £20.—Apply Frank F. Wellington, as above.

**TWO MOTOR DELIVERY VANS**, in good condition, can be altered into waggonettes; £75 and £125.—Apply Frank F. Wellington, as above.

**WELLINGTON'S MOTOR-CAR REGISTER AND ADVERTISER**, posted free to any address.—Send postcard for copy to Frank F. Wellington, proprietor, 36 St. George's Square, Regent's Park, N.W.

**ENGINEER** (29) desires Re-engagement, anywhere. Gas engine, oil engine, motor-car expert, competent to construct throughout or control.—Address, "Petrol," 12 Wharton Street, London, W.C.

**INTERNATIONAL MOTOR-CAR** for Sale, to seat two persons, in good running order; can be tried before purchase.—Apply, Allard and Co., Ltd., Earlsdon, Coventry.

**BENZ IDEAL CAR** for Sale, in good going order; free trial; £120.—B. Wells, Crawley.

**BENZ CAR** for Sale, seats three, Connolly tires; new August, 1898; can be seen by appointment; £100.—40 New Kent Road, S.E.

**WANTED**.—De Dion or pattern 1½-h.p. Motor and Daimler Car-burettor; in good condition.—Particulars and price to J. L., *Motor-Car Journal*, 39-40 Shoe Lane, London, E.C.

**COVENTRY MOTETTE** for Sale, in splendid working order. New 3½ cylinder. What offers?—Grose, Limited, Northampton.

**WANTED**.—Competent Driver who can repair when necessary, and knows his business, to accompany me on my Cinematograph Tour.—Send full particulars, references and lowest wages to Mr. West, 34 Home Street, Edinburgh.

**MOTOR-CAR DRIVER**, thoroughly experienced in Daimler motors, wants Situation. Can do repairs; first-class references.—Box 101, *Motor-Car Journal* Office, 39-40 Shoe Lane, London, E.C.

## Trade Announcements.

[All Advertisements under this heading will be inserted at the minimum rate of 2s. 6d. for 30 words and thereafter at the rate of 1d. per word per insertion, but on no account will any Advertisement be inserted unless prepaid.]

**DO YOU KNOW?**—Mr. Frank F. Wellington is the Agent for London and the South of England for the **ASTER Motor-Tricycle**, the fastest hill-climber in the world; will travel thirty miles an hour.—Send for list to Frank F. Wellington, 36 St. George's Square, Regent's Park, N.W.

**YOU SHOULD TRY ONE**.—Wellington's English-made Sparking Plugs for De Dion and other Motors; only 4s. each, renewals 1s. each. Any one can re-fit them. Send P.O. 4s. 3d. for sample. Note only address, Frank F. Wellington, 36 St. George's Square, Regent's Park, London, N.W. Telegrams: "Overtoiled, London." Telephone: 651 King's Cross.

**PLATINUM**.—Used Ignition Tubes Wanted, and Platinum Scrap of all kinds Purchased; best prices by Derby & Co., 44 Clerkenwell Road, London, E.C. Established 1797.

**IVEL HOTEL, BIGGLESWADE**, on the Great North Road.—A large supply of Carless' Petrol and Lubricating Oil always in stock. Ivel Cycle and Motor Works at back of hotel. Accumulators Charged.—Proprietor, Dan Albone.

**THE CLIFT ELECTRIC CARS** are thoroughly reliable. Batteries run thousands of miles without repairs. Prices from 255 Guineas. Motor-Cycles with De Dion Engines, 2-Speed Gear and Free Motor, 84 Guineas; Ordinary, 69 Guineas. Second-hand Electric Car £30. Repairs of all kinds.—E. H. Clift, Sinclair Motor-Car Works, Sinclair Mews, Kensington, W.

**BRIGHT STEEL NUTS, PINS, SCREWS, CUPS AND CONES** for Motor-Cars and Cycles, in Stock or Pattern. Best English make only.—A. Marmaduke Hart, Vicarage Park, Woolwich, S.E.

"**THE MOTOR-CAR MANUAL**," by R. Moffat Ford, deals with every type of oil motor in a plain and simple manner, for lay readers. How to buy a motor-car, and how to treat it when bought. Why is a motor when it stops? How to make an excursion, and so forth. Treats fully of Daimler, De Dion, Benz, Bollée, Panhard, Mors, Peugeot, and other motors. Post free in exchange for Postal Order value 2s. 6d.—The Motor-Car Co., 168 Shaftesbury Avenue, London, W.C.

## STANLEY, POPPLEWELL & CO.,

Fellows of the Chartered Institute of Patent Agents,

61 & 62 CHANCERY LANE, LONDON, W.C.

(ESTABLISHED 1879.)

Circular of Information  
free by post.

Opinions given as to Infringement and  
Scope of Patent.

## PORCELAINS, WITH CENTRAL PLATINUM WIRE FOR BENZ CARS

SOUTHERN MOTOR CAR CO., 59 BRIXTON ROAD, LONDON, S.W.

## The Clift Electric Cars (British build), suitable for Doctors and Ladies.

The simplest to drive. Prices from 255 Guineas. **Motor-Cycles**, the best, with De Dion Motor, from 69 Guineas; fitted with two speed gear and free Motor, 85 Guineas.

**REPAIRS, CHARGING, &c.**

**E. H. CLIFT**, Sinclair Motor-Car Works, Sinclair Road, Kensington, W.

# THE Motor-Car Journal.

Vol. I.]

LONDON, FRIDAY, OCTOBER 20th, 1899.

[No. 33.]

Published Weekly by CORDINGLEY & CO., 39 & 40 Shoe Lane, London, E.C.

## COMMENTS.

THOSE responsible for the behaviour of the horses at Windsor which are employed in the service of the royal family have taken the wise course of putting them through a course of instruction with the motor-car. Recognising that the automobile is becoming an increasingly familiar object in Berkshire, Lieutenant Hickey determined to act upon the advice recently given by Captain Langrishe, and train the

horses under his care to the sight of the automobile. Dr. Bruce Porter, an enthusiastic automobilist, of Windsor, was invited to try the nerves of the royal animals. Taking his vehicle to the mews, the horses were ridden or led round the automobile to give them an opportunity for observation. Secondly, Dr. Porter drove his car round the horses, and finally he appears to have run amuck amongst them in a way that would have sent some of the less respectable London cab horses into hysterics. Never did a horse get beyond control during the whole series of experiments, and although the car was made to puff and snort and perform various objectionable feats, the animals expressed no great concern. The least notice of the novelty was taken by a pure bred Arab, whose dignified demeanour demonstrated that manners and blood go together in the equine nature. It is to be hoped that the example of the director of the royal stables will be followed throughout the country. If country jobmasters and 'bus proprietors, etc., would have a motor-car in their yards for a day or two the horses would quickly become accustomed to its presence, and the excitement now felt by some unmannered brutes on seeing a motor-vehicle would no longer lead to accident and danger.

### A Dream of a Horseless City.

ONE of the young men on our staff is a Visionary—with a capital V—and he has asked for publicity for the following: "I hate the din and clatter of our busy streets, the rumbling of heavy wagons along our thoroughfares, and the constant tapping of iron-shod horses upon stone setts or hardwood roadways. To me the odour of the Ludgate Circus area in the summer days is offensive, while I equally dislike the stables—there must be thousands of them in our City—which are the great breeding-ground of flies. Oh! how I long for the day when the swiftly-gliding motor-car will defy the fog and police alike, rendering locomotion a pleasure, and in its almost silent progress do something to bring about that condition of quiet which Daudet thought he realised when in London a few years ago. With the universal adoption of the motor-car and the disuse of the horse for ordinary vehicular traffic, the smell of the wood pavement will not rise so high in summer, and the flies not buzz so monotonously about our ears. Then, Mr. Editor, shall I be glad." So, too, will others, for stripped of its semi-sentimentality the foregoing is useful in calling attention to two great annoyances

experienced as the result of the number of horses now on our streets.

### Punctuality.

To secure the success of motor-car services the punctuality with which they arrive at the starting-point and the regularity with which they call at the advertised stopping-places are alike indispensable. Otherwise disappointment to would-be passengers will develop into disgust, and disgust will lead to loss of patronage. We are led to thus emphasize the point because of a letter from a gentleman at Neath, who complains that the driver of a car which should have stopped at Gnysymardy Road at a certain time did not do so, causing inconvenience to several who had wanted to travel. Every proprietor of such a service should arrange a timetable and regard it as the law of the Medes and Persians. If this is true of the railway and tramway services it should be even more important in the case of a new means of public convenience and conveyance.

### Motor-Vehicles for Transport.

ON the occasion of the garden party given by Sir W. D. Pearson, M.P., at Paddockhurst, Three Bridges, we were able to show the immense advantage possessed by the automobile over horse-drawn vehicles in conveying guests to and from the station—saving considerable expense, and getting everyone away in good time. A correspondent of *To-Day* has also discovered the advantage. He lives six miles from the railway station, a good way up an eminence of no slight gradient, and the transport of visitors and their luggage by the old methods was a matter requiring careful adjustment. "The motor-car," we are told, "has changed all this. It can be sent as often as may be desired, can carry heavy weights, never tires, and does not mind the hill, while the expense is infinitely smaller than that of maintaining two strong horses for the omnibus." It is very clear that the advantages of the motor-car are illimitable.

### Motor-Cars in Australia.

IN the last issue to hand of the *Australian Cyclist* there appears a lengthy interview with Mr. Kelburne E. Edge, managing director of the Austral Cycle Agency Proprietary Ltd., Melbourne, in the course of which an interesting reference is made to the question of automobilism and motor-cars in the Antipodes. Mr. Edge's impression is "that it will be a considerable time before there is any profitable business to be done in motor-cars or motor-cycles in Melbourne, as people want definite proof that they have shown themselves successful in this country; and, again, we have to face the fact that motor-cars are operated here under very different circumstances to that which obtains in England or on the Continent. Nearly all the motors being built in England or France are operated by petrol, or, as we call it, gasoline. At present, in Australia this oil can only be obtained in small quantities, and at so higher price that it is almost prohibitive. Another point against the importation

of motor-vehicles is the high cost of freight and duty, which, added to the original figures, makes the price very steep. Our Customs demand a duty of 30 per cent. on the motor portion of any motor-carriage or cycle, and the balance is subject to 25 per cent. if a carriage, or 10 per cent. if a cycle. I have been surprised that the G.P.O. authorities and other large concerns to whom cheapness of transport is a matter of great importance have not followed the example of many of the great home firms and adopted motor-cars in place of the lumbering horse-drawn vehicle. However, I think there will be a number put into use in Melbourne during the next years."

#### A Lady Automobilist.

AMONG lady motorists Mrs. Kennard is rapidly coming to the front, achieving fame as the driver of a motor-car. She has previously won distinction as a novelist. Mrs. Kennard lives in view of the hunting fields of Northamptonshire and Leicestershire, and she is as keen a sportswoman as any in the neighbourhood. She is the second daughter of Mr. Samuel Laing, the late chairman of

the Brighton Railway, and all her novels ("Wedded to Sport," "Straight as a Die," "Twilight Tales," etc.) are of a sporting character, and this fact makes the lady's accession to the ranks of automobilists the more noteworthy. As is the case with several leading horsemen, she recognises that there is nothing incongruous in owning horses and driving her own motor-car—whose praise she sings in our correspondence columns this week. In the accompanying illustration Mrs. Kennard is seen mounted on her car, ready for a run.

#### Motor-Cars in Surrey.

At the Surrey Quarter Sessions, at Kingston-on-Thames, on Tuesday, the Standing Joint Committee reported that complaints had been received by them of the rate at which motor-cars were driven through the various parts of the county. As they believed the complaints to be well founded, the committee had sent a communication to the Local Government Board to the effect that in their opinion it was desirable that a by-law should be forthwith made requiring every motor-car to carry a denoting mark or number so placed upon the vehicle as to be at all times easily seen by pedestrians. The action of the committee was confirmed.

#### Charging Stations for Electrical Vehicles.

As the use of electricity extends, many new features of interest will be found along our country roads, and the development of electrical vehicles may completely revive the old coaching roads. At various points there will be opportunities for the erection of comfortable hotels, not only

with housing accommodation for automobiles, but also in conjunction with charging stations. Chicago is the first American city to possess a charging plant for its electrical cabs and other vehicles. Livery stables in Michigan Avenue, Chicago, are to be remodelled for the purpose by the Illinois Electric Vehicle Transportation Company, and current will be obtained from the Chicago Edison Company. Machinery will be installed for handling the battery trays, so that a set of exhausted cells can be taken from a cab and replaced by a fresh battery in about two minutes. The operation of charging the cells will be going on constantly, so that charged battery sets can be had at any time. The electric stations in this country should, remarks our contemporary, *Industries and Iron*, bear the foregoing development in mind.

#### The Automobile Club Trials.

We are informed that the committee of the Automobile Club, of Whitehall Court, S.W., have made arrangements by which manufacturers, authorised agents, and owners may at any time submit motor vehicles for trial and certificate as to (a) hill-climbing speed, (b) 100-mile record, (c) speed of motor-cycles on a racing track. A small fee to cover expenses of the trials and certificates will be charged. The hill-climbing trials and 100-mile trials may be made in the neighbourhood of London or in the Coventry and Birmingham districts. As regards speed on the road, no pace beyond the legal limit will be permitted or recognised.

#### Brougham v. Motor-Quadricycle.

BEFORE Judge Addison in the Southwark County Court on Tuesday a leading London jobmaster obtained a verdict against the London Autocar Company, in which the difficulties of automobilists were fully revealed. As will be seen from the special report in another page of the present issue, on the side of the jobmaster were a trio of horsey witnesses—his driver, a cabman, and a 'bus driver—backed up by a policeman, while the driver of the quadricycle which got into difficulties could only call his passenger, and as the plaintiff's witnesses declared they had seen the accident and those of the defendant company had not, the former won the case. It was agreed that the quadricycle—described by one of the counsel engaged as a "four-wheeled tricycle"—was under the brougham, and the question was, How did it get there? We should have been pleased to have heard from Judge Addison his reason for coming to the conclusion that it was all the fault of the motor-cycle. Expert evidence was to the contrary; the opinion of those who saw the accident exonerated the brougham. Under the circumstances, the most satisfactory ending would have been for each party to have paid for the repairs to his own vehicle, but that the London Autocar Company should have to pay both bills seems contrary to common sense.

#### The Speed of Motor-Cars in Rural Districts.

THE question of the speed of motor-cars in rural districts came up at a meeting of the Yeovil District Council last week, when the Rev. W. D. H. Armstrong moved "That the Local Government Board be asked to revise their rules regulating motor-car traffic in rural districts, so that the danger to which drivers and occupants of carriages are now exposed in consequence of this traffic may be minimised." The rev. gentleman urged the importance of the resolution, remarking that motor-cars were apt to come very suddenly upon the pedestrian. He would specially ask the Council to draw the attention of the Local Government Board to the necessity of giving warning on the part of the drivers when within 200 yards of a *pedestrian* or vehicle, and he considered the speed of twelve miles an hour excessive; ten miles was sufficient. After some discussion the resolution was amended to read "That it be desirable to have the

rules revised." The resolution was then adopted, and a committee of three appointed to draw up the letter to the Local Government Board. We can hardly believe that the gentleman was serious in his suggestion that the hooter should be sounded when within 200 yards of a pedestrian. If he is, and the Local Government Board adopts the recommendation, there will be room for some one to devise a continuous-sounding hooter, driven, say, off the motor-shaft. The probability of such an arrangement being necessary is, however, very remote; not only so, but it is altogether unnecessary and highly undesirable.

#### The Progress of Automobility in Scotland.

OUR correspondent "Brown Heather" keeps our readers well posted regarding the progress that is being made in connection with the adoption of motor-cars in Scotland. If further proof of this progress be required it can be found in a letter we have received this week from Mr. Percy Richardson, of the Daimler Motor Co., Ltd., an extract of which we give below. Mr. Richardson has just completed a business tour through Scotland, and gives a couple of instances to show how the industry is developing. The first case is that of the Edinburgh Autocar Co. This Company have been running eighteen cars since the beginning of the year in competition with the tramways in Edinburgh at

penny fares, and also letting them out for private parties. "They have made extensive experiments, both from a profit-earning point of view and also to find out the most suitable car for their purpose, with the result that I had the pleasure of booking an order from them for twenty cars, seventeen of which are to be ten-seated wagonettes with detachable light wood covers, fitted with glass windows, a photograph of which I enclose. These cars are for street service." The Company have also purchased a Daimler "Universal" sporting car, adaptable to seat two, four, or eight persons, for private hiring, and also a Daimler 12-b.h.p. car to seat sixteen persons, which they intend to utilise for public and private work. The second case instanced by Mr. Richardson is that of the Caledonian Motor-Car and Cycle Co., of Aberdeen, from whom he secured an order for six Daimler wagonettes to seat eight persons.

#### Maps for Automobilists.

THE Board of Agriculture notify us that the Ordnance Survey are issuing a new series of special folding pocket maps for certain towns and country around on the scale of one inch to the mile. The maps, which are printed on thin tough paper in a cover, are not only useful for general topographical purposes, but should also prove serviceable to

motorists, cyclists, and pedestrians, since they show all the roads in colour, indicating their character and whether metalled or not, also footpaths, hills, rivers, towns, villages, railway stations, and local boundaries.

#### A Short Run in Bedfordshire.

LAST week end we had the pleasure of a short run in company with Mr. Dan Albone, of Biggleswade, on his little "Victoria Combination" car. The morning was bright and fine, and leaving the Ivel Hotel we first visited the quaint old village of Ickwell, on whose green there stands the curious Maypole depicted in the accompanying illustration. A few miles further we came to the model village of Warden, where the cottages are in marked contrast with

those at Ickwell. The little "Victoria Combination" car gave Mr. Albone some slight trouble when first he acquired it, more particularly as regards the manœuvring of the variable speed gear, but he is now fully acquainted with the method of controlling the vehicle, and in his hands, on the short ride above mentioned, it ran splendidly, a speed of twenty miles per hour on the good roads of Bedfordshire being easily attainable.

#### The Albone Motor-car.

WHILE at Biggleswade we had an opportunity of inspecting the new car on the construction of which Mr. Albone has for some time been engaged. The vehicle takes the form of a four-seated *vis-à-vis*, the body being entirely independent of the frame. There are numerous special features in the new car, particularly as regards the construction of the frame and also the arrangement of the motor and transmission mechanism. As soon as the vehicle is completed we hope to be able to publish a description of it, with illustrations.

#### The Identification of Motor-Cars.

THE Standing Joint Committee of the Surrey County Council has sent us a copy of the letter it has addressed to the Local Government Board urging that regulations should be issued providing for the more easy identification of light locomotives. The Committee refers to the increased number of motor-cars and cycles and to the complaints it has received of the undue speed at which many of them are driven, and expresses the opinion that the time has arrived for some regulation to be made as to a denoting mark or number upon all light locomotives, so placed upon the vehicle as to be at all times

easily legible. Appended to the letter are a series of extracts from letters received from the chief constables and superintendents of police in the neighbouring counties and boroughs in reply to a circular sent by the Chief Constable of Surrey requesting an expression of opinion on the matter; these are practically unanimous as to the advisability of an addition to the regulations in the sense indicated.

#### The Proposed Ladies' Automobile Club.

It is this evening that the meeting takes place at Lady Harberton's residence to consider the proposal to form a Ladies' Automobile Club. From a letter we have just received from Miss N. G. Bacon, the proceedings promise to be of an interesting character, for in addition to the consideration of the question of forming an Automobile Club for ladies, three short papers are to be read—one by Mrs. Bazalgette on "Lady Motorists," one by Miss Clara Fazan on "Reformation of Horseless Vehicles," and one by Miss Bacon on "Women and Automobiles." The proposal appears to be

THE "CHAUFFEUR'S" WINTER COSTUME—A FRENCH SUGGESTION  
FROM *L'Illustration*.

meeting with approval, as favourable letters have been received from Sir David Salomons, Sir Francis and Lady Jeune, the Dowager Duchess d'Uzes, Madame Sarah Grand, Mr. Hiram S. Maxim, Mr. Henry Cunynghame, Mrs. Jacob Bright, Professor C. Vernon Boys, Miss Frances Lord, president of Bond of Union, who owns and drives a car; Miss Goodrich-Freer, late secretary Swanley Horticultural College, who last summer went on a tour in Northern Highlands, with six other people, in a motor-car; Miss Emily Janes, editor of "Englishwoman's Year Book"; Mr. J. K. Starley, Mr. R. W. Buttemer, and Mr. F. H. Bowman, D.Sc., F.R.S., whose eldest daughter drives his car.

MESSRS. RENNIE AND PROSSER, LIMITED, Mitchell Street, have been appointed sole agents for Glasgow and district for Royal Enfield motor-tricycles and quadricycles.

## A LARGE GERMAN ELECTRICAL OMNIBUS.

IN our last issue we illustrated the large petroleum-spirit omnibus which has lately been put in service in London. Through the courtesy of the builders, Messrs. Lange and Gutzeit, of 22 and 23 Frankfurter Allée, Berlin, O., we are able to give herewith an illustration of a large electrical omnibus they have lately constructed for the Neuer Berliner Omnibus Gesellschaft. The vehicle has accommodation for twenty-eight persons, including the driver—two on the front platform, twelve inside, and fourteen outside. It is driven by two 4-h.p. electro-motors, geared by large spur wheels to the rear axle. The electrical energy is supplied by a battery of Tudor accumulators slung in a box underneath the body of the car. Unfortunately, we are unable to give the number or electrical capacity of the accumulators, but the makers inform us that a run of 12 kilometres can be made on one charge and that the battery can be recharged in a very short space of time. The vehicle is provided with both electrical and mechanical brakes, which can pull the vehicle up in a very short distance, even when travelling at full speed. The steering is effected by a vertical hand wheel connected with the front road wheels. The 'bus has, we learn, been in use in the German capital for over a month, and has, so the makers inform us, given every satisfaction. Messrs. Lange and Gutzeit are at present engaged on the construction of a 'bus on similar mechanical lines but having no outside seats. It will have accommodation for eighteen passengers, and is intended for service in small towns.

## THE HEAVY MOTOR-VEHICLE TRIALS IN FRANCE.

(From Our Own Correspondent.)

I AM now able to supplement my remarks of last week *à propos* of the recent heavy automobile trials at Versailles by means of various data relating to the daily performances of each competing vehicle. In the first instance I would remind English readers that the two routes, known as B and C, over which the trials were made, measured respectively 46 kilometres 500 metres and 66 kilometres 500 metres, both embodying a fair amount of hilly country. Taking the competitors in order the first was:—

(No. 1).—KRIEGER ELECTRIC DELIVERY VAN, which made the following record:—First day: started on route B at 11.33 a.m. and returned at 11 p.m., having found it necessary to recharge once *en route*. Second day: started on route B at 10.41 a.m. Third day: did not start, owing to slight accident sustained previous evening. Fourth day: started on route B at 9.4 a.m. and returned at 3.16 p.m.; time occupied in ascending the hill of Pecq, 4 minutes. Fifth day: started on route C at 9.25 a.m. and returned at 6.27 p.m.; delayed two hours at Cernay, and two hours at Gif. Sixth day: started on route C at 9.23 a.m. and returned at 6 p.m.

(No. 2).—JENATZY ELECTRIC DELIVERY VAN.—First day: started on route B at 9.26 a.m.; two kilometres from start an axle was "seized" and vehicle returned to Paris for repairs. Second day: started on route B at 9.11 a.m., returned at 2.32 p.m. Third day: started on route C at 8.50 a.m. Fourth day: started on route B at 9.41 a.m. and returned at 3.14½ p.m.; time occupied in ascending the hill of Pecq 3 m. 18 s. Fifth day: started on route C at 9.9 a.m. and returned at 3.43 p.m. Sixth day: started on route C at 9.12 a.m. and returned at 4.15 p.m.

(No. 3).—DE DION 30-H.P. STEAM OMNIBUS.—First day: started on route C at 9.32 a.m. and returned at 3.44 p.m. Second day: started on route B at 9.6 a.m. and returned at 12.31 p.m. Third day: started on route C at 9.4 a.m. and returned at 2.36 p.m. Fourth day: started on route B at 9.6 a.m. and returned at 2.27 p.m.; time

## A Large German Electrical Omnibus.

(For description see page 520.)

occupied in ascending the hill at Pecq 4 m. 20 s. Fifth day: started on route C at 8.56 a.m. and returned at 2.53 p.m. Sixth day: started on route B at 9 a.m. and returned at 12 p.m.

(No. 4).—DE DION 25-H.P. STEAM OMNIBUS.—Did not compete, as the recent strike of workmen prevented the vehicle being finished in time.

(No. 5).—DE DION 25-H.P. STEAM LORRY.—First day: started on route B at 9.36 a.m. and returned at 3.12 p.m. Second day: started on route C at 8.33 a.m. and returned at 3.23 p.m. Third day: started on route B at 8.37 a.m. and returned at 1.42 p.m. Fourth day: started on route B at 8.45 a.m. and returned at 2.39 p.m.; time occupied in ascending the hill at Pecq 4 m. 20 s. Fifth day: started on route C at 8.43 a.m.; on the hill of Vaumussien met with a slight accident owing to mistake by driver. Sixth day: started on route C at 9.19 a.m. and returned at 4.19 p.m.

(No. 6).—DE DION 50-H.P. TRACTOR LORRY.—First day: started on route B at 10.16 a.m.; broke down, and abandoned competition.

(No. 7).—PANHARD 12-H.P. PETROL OMNIBUS.—First day: started on route C at 9.59 a.m. and returned at 6.20 p.m. Second day: started on route B at 9.10 a.m. and returned at 3.11 p.m. Third day: started on route C at 8.47 a.m. and returned at 2.17 p.m. Fourth day: started on route B at 9.2 a.m. and returned at 3.16 p.m.; time occupied in ascending the hill of Pecq, 6 m. 55 s. Fifth day: started on route C at 9.6 a.m. and returned at 3.11 p.m. Sixth day: started on route B at 9.15 a.m. and returned at 2.37 p.m.

(No. 8).—DIETRICH 9-H.P. PETROL LORRY.—First, second, and third days: did not run. Fourth day: started on route B at 9.10 a.m. and returned at 3.30 p.m.; time occupied in ascending the hill of Pecq, 12 m. 50 s. Fifth day: started on route C at 9.7 a.m. and returned at 3.27 p.m.

Sixth day: started on route C at 8.53 a.m. and returned at 4.46 p.m.

(No. 9).—DIETRICH 9-H.P. PETROL LORRY.—First day: started on route B at 9.13 a.m. and returned at 4.52 p.m. Second day: started on route C at 8.31 a.m. and returned at 4.5 p.m. Third day: did not start owing to absence of mechanic. Fourth day: started on route B at 8.45 a.m. and returned at 3.25 p.m.; time occupied in ascending hill of Pecq, 12 m. 50 s. Fifth day: started on route C at 9.6 a.m. and returned at 4.17 p.m. Sixth day: started on route C at 8.30 a.m. and returned at 4.27 p.m.

(No. 10).—CHABOCHE 15-H.P. STEAM DELIVERY VAN.—First day: did not run. Second day: started on route B at 10 a.m.; broke down, and abandoned competition.

(No. 11).—PURREY 30-H.P. STEAM LORRY.—First, second and third days: did not run. Fourth day: started on route B at 9.18 a.m. and returned at 9 p.m. Fifth day: started on route C at 9.45 a.m. Sixth day: started on route C at 9.35 a.m.

The indifferent display made by one or two of the competing vehicles was attributable to their not having been properly tested previous to these trials, for which they had been hastily completed. The official figures and results of the tests are not likely to be issued for some time to come, and until their production it is not possible to gauge the merits of the competing cars.

WE learn that in addition to supplying "Star" motor-cars complete, the Star Motor Co., of Wolverhampton are now in a position to supply the same without "body," as also all the various parts and accessories comprised in the same such as axles, wheels, tanks, springs, silencers, etc. The company are also arranging to undertake repairing, overhauling, and repainting, etc., of any type of motor-car.

## MIDLAND MOTOR NOTES.

By "HERCULES."

Motor-Cars  
at  
Leicester.

LAST week I referred to the proposal of the original promoters of the Leicester Motor-Car Company, Limited, to extend their operations by the introduction of fresh capital. I am glad to say that the plain facts adduced as to the working of the cars and the anticipations of future success have caught on with the public, who have faith in the undertaking, not only as a good investment but as a popular public institution. Progressive as Leicester is as a centre of commerce it is greatly behind the times in its 'bus and tram service. The patience of the populace has been long-suffering in this respect, though now and again a cry of indignation has been raised with the view of quickening the minds of the Tramways Company to a keener recognition of their obligations to those whom they had undertaken to serve. The apathy of the tramway people promises at last to receive its just reward, for I understand that the new project has been taken up with zest, and that the allotment will take place in a few days. It may be safely concluded, therefore, that in a short time Leicester will be in possession of an efficient motor-car service for the conveyance of passengers not only to the outlying suburbs but from point to point in the very centre of the town. In other words, there is to be a determined opposition to the present slow and inefficient 'bus and tram service, and for this purpose the Motor-Car Company will introduce the well-known "Lifu" steam 'bus. Several experimental trials have already been run, and they have given great satisfaction both as regards speed and comfort. The introduction of this service into a large town like Leicester will no doubt popularise motoring in the neighbourhood. Already one doctor has secured a splendid advertisement by the adoption of a neat little car, and there is no doubt that in the near future this example will be followed not only by the medical profession but by tradesmen and others who at present have to rely on the slow and yet costly work of the horse.

A New Tire and  
Wheel-Making  
Concern.

MR. J. J. HART, of the "Fleet" Carriage and Motor-Wheel Works Co., Fleet-street, Coventry, has resigned his position with one of the leading motor manufacturing companies in Coventry, and has commenced business on his own account. He tells me that he has already more work on hand than he can comfortably deal with, and has engaged a number of men who are experienced in the trade. His chief attention is devoted to the supplying of tires of all descriptions for motors, and to building wheels for the motor trade.

## "On the Road."

THE Beeston Motor Co., Ltd., Coventry, have arranged for their traveller, Mr. E. A. Job, to do his journeys on one of their latest pattern Beeston motor-tricycles, with a 2½-h.p. motor fitted with electric ignition. This will give the agents an opportunity of seeing a motor-tricycle undergoing the wear and tear of every-day usage.

Motor "Body"  
Building in  
Coventry.

THE Burton Carriage Works, Fleet Street, Coventry, have three motor-wagonettes with canopy attachment in course of completion, and are smart in appearance. Mr. Burton's speciality is the finishing of rough bodies—that is, trimming, painting, etc. He also goes in for carriage designing, and is doing work for the larger motor firms in Coventry. The business has increased so rapidly during the last few months that Mr. Burton is looking out for larger premises.

A New Car  
at Coventry.

A FRIEND of mine tells me that a good deal of attention was devoted to a four-wheeled motor-carriage which made its appearance in the Coventry streets at the beginning of the week. Coventry folk have by this time become accustomed to automobiles of all descriptions—from the heavy trade vans to the light and elegantly constructed dog-cart; but this one, he says, was something out of the ordinary—at least, it seemed so to him; and so when the vehicle stopped he was one of the small crowd that gathered around. There was something of the landau type about it, and his first idea was that it had been built for pleasure. What struck him most was the queer looking arrangement attached to the carriage at the rear. To describe it gave him no end of trouble. I gathered that the engines were concealed inside this arrangement, which he said had the appearance of a huge meat safe, painted white. The body of the vehicle vibrated with each throb of the engine, and he wanted to know how there could be any pleasure to be seated directly over such a contrivance. I told him that the vibration and noise of the motor would be almost imperceptible to the riders as soon as the vehicle was on the move, and he afterwards told me that he was himself greatly surprised at the ease and smoothness with which the landau made its way along the street.

A Novelty  
in Tires.

ONE thing which appealed to my friend was the happy idea which seemed to have struck those in charge when having to deal with a refractory tire. One has often seen the rubber of a solid or cushion-tired bicycle bound to the rim with string, and bandaged pneumatic tires are not unknown; but the tire of this motor-carriage was actually bound on with galvanized wire! The wire was made up of several strands, and about the thickness of a lead pencil. One end was attached to the spoke of the wheel, and the remainder bound the rim and tire together. The wire had found its own depth in the rubber, and effectively answered the purpose intended, though it could not be said that the appearance of the wheel was improved.

THE dissolution is announced of the Société des Automobiles et Automobilettes "Rheda" of Paris.

ACCORDING to the last Australian mail, Mr. E. W. Rudd, of the Australian Cycle and Motor Co., Ltd., Melbourne has just received a Pennington motor-car.

SIR FRANCIS and LADY JEUNE have returned from their motor-car tour to their Berkshire seat, Arlington Manor, near Newbury. They visited Coventry, Birmingham, Malvern, Gloucester, Hereford, Monmouth, Bristol, Wells, and Bath.

FROM all we hear the Motor-Car Club will be very well supported in their run to Brighton on November 13th. They are on this occasion inaugurating a novelty which the public will, we think, not be slow to appreciate. They will issue a programme giving some details of the cars and the names of the drivers. In order that this may be as correct as possible all owners of cars proposing to attend the fixture are requested to send full details of their cars to the hon. sec. of the Club without delay.

THE Cycle and Motor Company, Limited, has been registered with a capital of £60,000, in £1 shares, to acquire the business of the John Griffiths Cycle Corporation, Ltd. (incorporated in 1896), to adopt an agreement with John Gillespie, and to carry on the business of manufacturers of wholesale and retail dealers in and agents for cycles, bicycles, tricycles, velocipedes, carriages, sewing machines, motors, motor-vehicles, etc. The number of directors is not to be less than five nor more than seven; the first are: Harvey Du Cros, jun., Charles Sangster, Robert Burns, P. J. Maloney, John W. Stocks, and George Tuke.

## CORRESPONDENCE.

TO THE EDITOR OF *The Motor-Car Journal*.

### IMPROVEMENTS IN DAIMLER CARS.

SIR,—I think the following paragraph will interest those of your readers who own Daimler cars. I have fitted a very successful cooler to my vehicle; it is arranged in such a manner as to improve the appearance of the car. No pump or fan is required; the quantity of water carried is under two gallons instead of twenty, and this quantity will last many days. As I have several small leaks I cannot say exactly, but I have driven sixty miles and only required a quarter of a pint of water to fill up. The power wasted in driving a pump 300 strokes per minute is considerable, and with the saving in weight effected by dispensing with the pump and fitting a cooler such as I have adopted, and a reduced temperature in the cylinders, I think any 5½-h.p. Daimler would be improved quite one mile per hour. The relief about the pump is very considerable, as before I was never certain when it would stop. Also I have fitted a starter from the seat that makes it quite as easy to start from the seat as with the handle, and much safer, as a kick-back can do no harm. I now always start from seat in preference to the handle. I hope to drive a car to Sheen House fitted with both these improvements on November 14th.

Lowestoft,  
October 14th, 1899.

Yours truly,  
E. ESTCOURT.

### INFORMATION WANTED.

TO THE EDITOR OF *The Motor-Car Journal*.

SIR,—Allow me to thank both you and "Brown Heather" for the information given in your last publication in reply to my letter to you in the issue of September 29th. The car I saw would no doubt be the hooded Daimler that "Brown Heather" refers to. I could not say that it was "phenomenally quiet," as I am too deaf to speak as to that point, but it was running very sweetly, and at a good pace, though up a moderate incline where I met it. I shall no doubt be able to get further information about it from the Daimler Co. The absence of fumes or any smell of oil, so far as I noticed, was what led me to infer that it was probably driven by electricity.

Perhaps you will allow me to ask motor manufacturing companies why they don't make a machine to act as horses, and to draw an ordinary carriage.

Edinburgh,  
October 16th, 1899.

Yours truly,  
J. R.

### EXPERIENCES OF A NOVICE IN SEARCH OF A MOTOR-CAR.

TO THE EDITOR OF *The Motor-Car Journal*.

SIR,—In June of this year my husband said he was prepared to buy a motor-car if I could find a suitable vehicle. Knowing absolutely nothing of my subject, I plunged into it with all the ardour of an enthusiast. I went to almost every dépôt in London, and from a mass of miscellaneous counsel gradually arrived at the following conclusions. Practically there were in this country two systems: the Daimler and the Benz. I saw carriages of the former make, and came to the conclusion that they were too cumbersome and intricate for a beginner. The cog-wheel transmission was likely to give trouble, and proved noisy in the running. After seeing a variety of other cars, I gradually arrived at the decision that there was nothing on the market so suitable to a novice and for real hard wear as Messrs. Hewetsons' Ideal Benz. But I wished to do nothing rash, and although I found everyone was willing to give a trial—if they sold a car—my object was to first test the car thoroughly before purchasing. This was not easily achieved. Once more I prosecuted an exhaustive search, and eventually succeeded in finding a teacher who owned a Benz Ideal and was willing to take me for fifty-mile

runs for a week for £1 a day. Although the terms seemed high, I decided it would be money wisely spent. I had no cause to regret the outlay, for not only was I taught the rudiments of driving but soon ascertained the exact capabilities of the car on all kinds of gradients. We went to Ripley, Guildford, Edenbridge, St. Albans, Oxted, etc. In the end we purchased a '99 Ideal Benz. For ladies I can conceive of no more perfect carriage. That very soon we shall see ladies driving their own cars, as they do in France, is my firm belief. To learn the rudiments is comparatively easy—most novices can drive a little alone at the second lesson; but to have complete control of the car and to know what to do in all circumstances requires both time and experience. This is where, I think, many of the manuals are misleading. The great snare, which leads to the undoing of the beginner, is pace. The high speed is so seductive that they are inclined to use it before they have learnt the art of suddenly stopping and of going down hill steadily. The faster the pace, too, the more difficult becomes the steering. Altogether, caution in the first stages is essential; but given ordinary care there is no reason why a woman should not steer a light car as safely as a man. No one who has not tried driving can have an idea of the fascination it possesses. No matter how long the drive we do not know a single moment of *ennui*. This is essentially a hunting country, and a certain prejudice exists against the motor-car, but I have already taken several of my friends for drives, and none have returned without their ideas on the subject undergoing a complete revolution. They have all been delighted and only the price deters them from becoming ardent autocarists. Truly it is a fascinating sport.

Yours faithfully,  
The Barn, Market Harboro',  
October 16th, 1899. MARY E. KENNARD,

### THE VALLÉE RACING CAR.

TO THE EDITOR OF *The Motor-Car Journal*.

SIR,—The Vallée racing car described in your last issue seems to be nothing but a glorified Bollée as to transmission gear, minus the—as I thought—indispensable adjunct to a petrol motor: variable speed or, more properly, power gear. Why M. Vallée's 16-h.p. engine can run satisfactorily without it when similar powered motors by, say, Panhard & Co. cannot, I am at a loss to understand.

The motor speed, of course, is variable, but with it, equally of course, the power. Suppose the car has to be brought up on a steep hill for any reason: I see no means of starting her again. Possibly in such a case the variable gear is supplied by the "mechanicien" with a pinch bar!

Ross, Co. Galway,  
October 16th, 1899. Yours truly,  
C. P. DAWSON.

### THE CINEMATOGRAPH ON TOUR WITH A MOTOR-CAR.

TO THE EDITOR OF *The Motor-Car Journal*.

SIR,—This week we have again motored over virgin ground, and as a natural sequence have caused no little sensation, especially amongst the lead miners at Middleton-in-Teesdale. We started on Thursday morning from Kirkby Stephen, Westmoreland, for Bowes, Yorkshire, and experienced considerable discomfort for the whole of the ride from incessant rain; and, travelling over some of the bleakest country we have yet negotiated, we never for a minute obtained any shelter. We had to climb the mountain known as Stainmore and it was all hard pulling for nearly nine miles. Bowes, the stopping-place for the night was duly reached. The room, which was of rather small dimensions, was quite full, and the entertainment a great success. From Bowes to Barnard Castle, only four miles and nearly all downhill until we crossed the Tees from Yorkshire into Durham, was done in 16 m. Just on entering the town we had to climb the Barnard Castle bank, up which we are told

no motor-car has been before without requiring a little pushing from behind. Mr. Lax and myself dismounted to ease the weight a little, but Mr. Sinclair remained at the helm, and with our full load on up we went, to the evident admiration of a crowd of onlookers.

On our next journey we found that something was wrong with the gear, for the cogs on the nine and twelve mile speeds would not engage, and we were compelled to take it easy and work on the three and six mile speeds, but as it was all up hill to Middleton-in-Teesdale this did not make any material difference, and ours being the first car ever seen amongst the lead mines almost everybody in the place turned out at the sounding of the horn. Next morning we had the gear out and examined it, and found that the teeth on the cogs of the nine and twelve speeds were very much worn; and I could see that I must at once arrange to have new gearing placed in the car.

I am quite confident that one gentleman in Middleton-in-Teesdale, having seen our car, is now determined to become the possessor of one for himself, and I gave him all the information I could. I hear the Daimler representative is now in Bishop Auckland and I have wired him to come over here and see my gear and give me his advice, for I can see that until I get new gearing in we must be content to do our next few journeys on the slow speeds.

I am, Sir, yours, etc.,  
T. J. WEST,  
Cotherstone, *Manager of the Modern Marvel*  
October 18th, 1899. *Co. (Ltd.), of Edinburgh.*

### THE BORDEAUX-BIARRITZ RACE.

TO THE EDITOR OF *The Motor-Car Journal*.

SIR,—Having received a photo taken of my car at Biarritz after the finish of the race, I am sending you one. I have also received exact "classement" of the competitors, which gives the following results:—

#### TOURIST SECTION.

| CLASS A.                      |  | 3rd Series.—                      |  |
|-------------------------------|--|-----------------------------------|--|
| 1st Series.—                  |  | Winner, Versein, 15h. 6m.         |  |
| Winner, H. Lafitte, 7h. 17m.  |  |                                   |  |
| 2nd Series.—                  |  | CLASS C.                          |  |
| Winner, L. Sanson, 7h. 53m.   |  | 1st Series.—                      |  |
| 2nd., Barbereau, 8h. 46m. 1s. |  | Winner, Cuzacq, 7h. 35m.          |  |
| CLASS B.                      |  | 2nd, Geo, 9h. 9m.                 |  |
| 1st Series.—                  |  | 3rd, Conderc, 12h. 35m.           |  |
| Winner, Knapp, 8h. 48m.       |  | 4th, Gintrac, 13h. 3m.            |  |
| 2nd Series.—                  |  | 2nd Series.—                      |  |
| Winner, Rolls, 6h. 44m.       |  | Winner, Cornilleau, 9h. 13m. 30s. |  |
| 2nd, Calvet, 7h. 15m. 42s.    |  | 2nd., Dubois, 9h. 51m.            |  |
| 3rd, Barrow, 7h. 51m. 5s.     |  | 3rd, Legendre, 10h. 1m.           |  |
| 4th, Fourcade, 10h. 27m.      |  | 4th., Bertain, 11h. 52m.          |  |

By this you will see that our car not only won in her own category but also beat the winners of all the other six categories, viz., cars above and below 6 h.p. carrying two, four and six persons, and also the tricycles, which therefore shows her up well especially as there were several Peugeot and other cars of 8, 10 and 15 h.p. in the tourist classes.

The actual arrivals at Biarritz, taking speed and tourist classes together, were as follows:—

|                          |                      |              |
|--------------------------|----------------------|--------------|
| 11 Levegh .. Vitesse..   | 16-h.p. Mors ..      | 2 p.m.       |
| 8 Antony .. " ..         | " ..                 | 2.4          |
| 22 Bertin .. " ..        | 3½-h.p. Trike ..     | 2.10         |
| 7 Petit .. " ..          | 15-h.p. Peugeot ..   | 2.32 15secs. |
| 66 Rolls .. Tourist      | 8-h.p. Panhard ..    | 2.47 30secs. |
| 62 Calvet .. " ..        | 10-h.p. Peugeot ..   | 2.57         |
| 10 Koechlin .. Vitesse.. | 15-h.p. " ..         | 2.59         |
| 83 Cuzacq .. Tourist     | 2½-h.p. Trike ..     | 3.1 30secs.  |
| 12 Broc .. Vitesse..     | 16-h.p. Mors ..      | 3.7 10secs.  |
| 6 Georges .. " ..        | " ..                 | " ..         |
| 71 Lafitte .. Tourist    | 6-h.p. Panhard ..    | 3.15 30secs. |
| 76 Barbereau .. " ..     | 6½-h.p. Dietrich ..  | 3.21         |
| 92 Cornilleau .. " ..    | Voiturette ..        | 3.25         |
| 64 Barrow .. " ..        | 9-h.p. Dietrich ..   | 3.27         |
| 77 Sansom .. " ..        | 8-h.p. Peugeot ..    | 3.29         |
| 9 Schneider .. Vitesse.. | Rochet Schneider ..  | 3.57 10secs. |
| 41 Thery .. " ..         | 8-h.p. Decauville .. | 3.59 30secs. |
| 93 Dubois .. Tourist     | Voiturette ..        | 4.6 30secs.  |
| 54 Knapp .. " ..         | Peugeot ..           | 4.9          |
| 106 Legendre .. " ..     | " ..                 | 4.17 30secs. |
| 103 Bertrani .. " ..     | Voiturette ..        | 4.22 30secs. |
| 91 Gintrac .. " ..       | 1½-h.p. Trike ..     | 4.33         |

|                       |                      |      |
|-----------------------|----------------------|------|
| 25 Rigal .. Vitesse.. | 2½-h.p. Trike ..     | 4.37 |
| 86 Conderc .. Tourist | Trike ..             | 4.50 |
| 65 Fourcade .. " ..   | 9½-h.p. Wagonette .. | 5.12 |
|                       | Dietrich             |      |
| 70 Versein .. " ..    | Brake Peugeot ..     | 6.20 |
| 105 Graz .. " ..      | Auto-tandem ..       | 6.28 |

As regards the checking at *contrôles en route* they give the following results, taking all seven tourist categories together:—

Start at 9 a.m. with intervals of 30 sec.

Passed Langon (27 miles from Bordeaux):—

|                      |                      |
|----------------------|----------------------|
| Knapp .. 10.3 a.m.   | Calvet .. 10.15 a.m. |
| Pascault .. 10.5 "   | Lafitte .. 10.16 "   |
| P. Dumas .. 10.9 "   | Rolls .. 10.19 "     |
| Barrow .. 10.15 "    | Fourcade .. 10.21 "  |
| and eighteen others. |                      |

Passed Auros:—

|                      |                      |
|----------------------|----------------------|
| Knapp .. 10.23 a.m.  | Rolls .. 10.38 a.m.  |
| Pascault .. 10.26 "  | Calvet .. 10.40 "    |
| P. Dumas .. 10.28 "  | L. Sanson .. 10.48 " |
| Barrow .. 10.36 "    | Fourcade .. 10.48 "  |
| Lafitte .. 10.37 "   |                      |
| and eighteen others. |                      |

Passed Grignols:—

|                      |                      |
|----------------------|----------------------|
| Knapp .. 10.54 a.m.  | Barrow .. 11.16 a.m. |
| Pascault .. 10.56 "  | Calvet .. 11.20 "    |
| P. Dumas .. 11 "     | Cuzacq .. 11.25 "    |
| Rolls .. 11.14 "     | Chain .. 11.25 "     |
| Lafitte .. 11.15 "   | Sanson .. 11.26 "    |
| and fourteen others. |                      |

Passed Casteljalous:—

|                     |                      |
|---------------------|----------------------|
| Knapp .. 11.5 a.m.  | Calvet .. 11.35 a.m. |
| Pascault .. 11.8 "  | Chain .. 11.37 "     |
| Dumas .. 11.12 "    | Cuzacq .. 11.40 "    |
| Rolls .. 11.27 "    | Barrow .. 11.43 "    |
| Lafitte .. 11.30 "  | L. Sanson .. 11.44 " |
| and fifteen others. |                      |

Arrived Mont-de-Marsan (end of first day):—

|  |              |
|--|--------------|
| Pascault .. 12.52 p.m.                   | Lafitte .. — |
| Dumas .. 1.3 "                           | Barrow .. —  |
| Rolls .. 1.19 "                          | Chain .. —   |
| Calvet .. 1.39 "                         |              |
| and fourteen others in straggling order. |              |

The first day found us winner of our own category (viz., cars above 6 h.p., and carrying four persons), but left a lot to make up to beat the others. We lost much time first day through chain coming off twice and motor running under power (never on fourth speed except down hill); in fact, at times during the first day it looked like not being placed at all. However, by working till 5 a.m. on the car we succeeded in improving her considerably for second day (the governors, a moving part of which had broken, had to be tied up, amongst other things).

Left Mont-de-Marsan at noon. *Contrôles* (second day) *en route* were:—

Passed St. Paul les Dax:—

|                      |                      |
|----------------------|----------------------|
| 1 Rolls .. 1.15 a.m. | Lafitte .. 1.30 a.m. |
| 2 Calvet .. 1.17 "   | Bergeon .. 1.30 "    |
| Barrow .. 1.26 "     | Sanson .. 1.35 "     |
| Cuzacq .. 1.27 "     | Dumas .. 1.40 "      |
| and seven others.    |                      |

Passed Bayonne:—

|                    |                      |
|--------------------|----------------------|
| Rolls .. 2.23 p.m. | Lafitte .. 2.49 p.m. |
| Calvet .. 2.33 "   | Bergeon .. 2.55 "    |
| Cuzacq .. 2.38 "   | Barrow .. 2.57 "     |
| and twelve others. |                      |

It will be seen that on the second day we almost immediately obtained the lead, and held it to the finish. The weather on the first day was fearful—roads very heavy and blinding storms; second day, fine mostly till finish.

There was one other Englishman racing, viz., Mr. Barrow, of Biarritz, who came in seventh of the tourists, or third in his class, on a Dietrich. It is curious that he offered the cup for the winning tourist, which was therefore offered and won by Englishmen. I hope shortly to have copies of a photo taken at start at Bordeaux, and will send you one.

It might be mentioned that great praise was due to the Committee of Organisation, all of whom were extremely courteous to us, in particular Dr. Creuzan, President of Autoclub Bordelais, and H. Borotar.

Paris,

October 18th, 1899.

Yours truly,

C. S. ROLLS.

# THE MOTOR-CAR CLUB'S OUTING.

TO THE EDITOR OF *The Motor-Car Journal*.

SIR,—For the last thirty years I have been interested in the progress of automobilism, and as a regular reader of your paper I noticed in your last issue an advertisement to the effect that the Motor-Car Club will hold its fourth annual run to Brighton on Monday, November 13th, and all motorists are invited to participate. The Automobile Club of Great Britain, which I believe contains among its ranks most of the best known owners of automobiles, also announces a meeting of motor-cars on Tuesday, November 14th. Both of these meetings are apparently to celebrate the passing of the Act which enabled motor-cars to use the roads. I shall be greatly obliged if you, sir, or any of your contributors (best of all the secretary of the Motor-Car Club) will inform us if it is a bona fide club, and not a trade association; and in order to convince us on this point it is most desirable that the secretary should give us (1) the names of all the members of the Club Committee; (2) tell us whether automobilists who are invited to join the run may inspect a list of the members at the premises of the Club; (3) give us assurances that the Club is supported by members' subscriptions and is not subsidised by the promoters or directors of any companies who are interested in promoting any special make of car. If the secretary of the Motor-Car Club can give this information and these assurances, doubtless many automobilists, including members of the Automobile Club, may wish to take part in the Motor-Car Club's run. If he cannot do this I must point out to ladies and gentlemen that in joining this run they allow themselves to become a means of advertising a trading association.

Knowing, sir, that you have the best interests of automobilism at heart, I trust you may find it possible to insert this letter in your next issue.

Mansion House Buildings, E.C. Yours faithfully,  
Oct. 18th, 1899. R. E. CROMPTON.

## AN AUTO-LIFT.

(From the "Automobile Magazine.")

# THE RAPIN SUPPLY-REGULATING AND CONSTANT LEVEL FLOAT FOR PETROL MOTORS.

THE accompanying illustrations (Figs. 1 and 2) show the details of an improved regulating float devised by M. P. Rapin, of Savigny-en-Septaine (Cher.), France, the object of which is to maintain constantly a certain level of spirit in the carburettor. The float comprises a water-tight cylinder *A* (Fig. 1), in the centre of which is formed the tube *B*. A second tube *C* is fixed to the lower portion of *B*. A third tube *P* is passed through *B* and *C*. The tube *P* is closed at its lower end *E*, but has an opening *X* at the side at about half of its length, the upper end *F* being connected to the spirit storage tank. When the level of the petroleum spirit rises the float also rises, and the tube *C* closes the orifice *X* of the pipe *P*. When, on the contrary, the level falls, the tube *C* descends and opens *X*, the spirit then passing through openings *I* in the tube *C*. A small helicoidal screw *K* is formed on the upper part of *P* to neutralise the movement of the liquid. M. Rapin claims that

FIG. 1.

FIG. 2.

not only has the movement of the liquid no detrimental effect, but that, on the contrary, the vibration assists the automatic working of the apparatus, the level remaining constant whatever the speed of the motor, this being attained without the use of valves or springs. The application of the apparatus to a carburettor is shown in Fig. 2. A hole *X* is pierced at the side at a point in such a position that a mark on the float will be at the height to which it is desired the level shall be maintained in the carburettor. This done, a pipe *X* (Fig. 2) is connected to the top of the regulator float *F*, and at *A* to the pipe *E*, which connects the storage tank *D* with the bottom of the carburettor. Two cocks *M* and *R* are introduced in the pipe *E*, one on each side of the junction *A*. On starting, the cocks *M* and *R* are both opened, this allowing the carburettor to fill rapidly. When the desired height is obtained, indicated by an ordinary float *K*, the cock *R* is closed and the engine started, after which the oil is conveyed to the carburettor through the by-pass pipe *P* to the regulator float *F*. It is stated that the apparatus is perfectly automatic in its action, and will maintain a constant supply of spirit, and keep the same at a constant level in the carburettor until the supply in the storage tank is exhausted.

THE Automobile Club de France has now no less than 1,910 members on its list.

A SLIGHT error crept into our description of the McLachlan heavy oil motor last week. We stated that the speed of the engine in connection with the company's small electric lighting plant was 1,500 revolutions per minute; it is, of course, the dynamo that runs at this speed, not the engine.

## MOTOR-CARS ON THE CONTINENT.

(From Our Own Correspondent.)

**The Paris-Madrid Record.**

CONTRARY to general expectations, M. Enrique Marzo's attempt to beat the Paris-Madrid record now standing to the credit of MM. Edouard de Perrodil and Henri Farman proved unsuccessful, although neither rider nor machine were at fault. The weather was alone responsible for M. Marzo's failure, for it treated him badly from the time of his departure on the night of the 10th inst. until he finally decided, on the 12th, to abandon the essay when a few kilometres beyond Bordeaux. The would-be recordist made his start, in company with Béconnais, from the Châlet du Cycle in the Bois de Boulogne, and arrived at Bordeaux some fifteen hours after the professional, having rested *en panne* at Dangé for a considerable time, due to the heavy rain short-circuiting his electrical connections. Shortly after leaving Bordeaux M. Marzo decided to cease his struggle against the elements, and accordingly returned to that town and took train for Madrid. Béconnais continued to battle on until he reached Bayonne, at which place he also gave in, and joining M. Marzo proceeded by train to the capital. An amusing feature of this latter portion of their trip was their ingenuity

A FREQUENT SCENE IN FRANCE.—MOTOR-CAR WAITING AT LEVEL CROSSING.

in avoiding payment of the railway company's extortionate charge of 320-francs for the carriage of each motor-cycle. Unable to secure a reasonable figure from the authorities at Bayonne the two chauffeurs detached the motors from their machines, and carried them in their compartment as baggage, the tricycles being also conveyed by the railway company as simple tricycles, and free of charge. These gallant motor men certainly deserved to reach Madrid!

**Narrow Escape of a Préfet.**

THE Préfet of Dordogne had a very unpleasant experience on Friday last as he was entering the préfecture at Périgueux on his return from Paris, and was fortunate to escape scathless. At the moment of his entry a motor-cyclist, travelling at a high rate of speed and carrying no lamp, crossed immediately in front of the préfet's carriage, so startling the horses that they bolted. The coachman fortunately retained his presence of mind, and it was due to his skill that a disaster was averted. The préfet subsequently declared that he did not regret the incident, for he would now take steps to ensure that all cyclists and automobilists should comply with the law in his district.

**Hill-Climbing Contest.**

THE annual hill-climbing contest promoted by *La France Automobile* will take place on Sunday, November 12th, on the hill of Canteloup. The length of the course is 1,820 metres.

**M. Léon Serpollet.**

ALL English friends of M. Serpollet, the well-known builder of steam automobiles, will be delighted to learn that he is progressing favourably and bids fair to make a speedy recovery from his recent attack of typhoid fever.

**The Toll at Rouen's New Bridge.**

THE authorities at Rouen having announced that automobiles making use of the new bridge would be charged a toll of one franc, many motor-cyclists were exercised in mind as to whether their machines would be included under this charge. A representative of *Le Journal des Sports* therefore called upon the authorities, and has ascertained that all automobiles weighing not more than 1,000 kilos. can avail themselves of the bridge at the modest charge of 25 centimes.

**A Motor-Car at a Baptism.**

AT Nice, on the 10th instant, there took place the baptism of the infant son of M. and Mme. Braun, the proprietors of the Hôtel d'Angleterre. At the conclusion of the ceremony the guests were taken a long drive in a number of automobiles, but I am unaware as to whether the hero of the day participated in this revelry of "teuf-teufs" or whether he has yet formed any decided views as to the practicability of self-propelled vehicles.

**A New Category.**

THE Commission Sportive of the Automobile Club of France has decided to create a new category of vehicles in addition to those already recognised. It will consist of voiturettes weighing up to 400 kilos. The two other categories recognised by the Club are—1, motor-cycles, etc., not weighing more than 250 kilos.; 2, vehicles weighing over 400 kilos.

**Mountaineering by Motor-Car.**

THE Munich papers report that a Munich sportsman has driven an automobile three-quarters of the way up the Herzogenstand, which is 1,757 metres high. He was prevented from getting further by a defect in the gearing, but was able to return the whole way on his car.

**Automobilism in Italy.**

A MEETING has just been held at Treviso, Italy, when it was decided to organize an automobile *fete* to be held in the town early next month. A committee, with Baron Franchetti as president, has been appointed to draw up the necessary programme.

A DAILY paper remarks that "there seem to be but three subjects of conversation just now—war, hunting, and automobilism. The first is inevitable, the second is seasonal, and the third the natural result of the motor-car's popularity across the Channel.

A LARGE steam motor mail van has just been supplied by Messrs. Julius Harvey & Co., of 11 Queen Victoria Street, London, E.C., for regular postal work in Colombo, Ceylon. It is expected that there will be a further development of this form of locomotion for postal work in the East.

## SCOTTISH NOTES.

### A Correction.

I SEE your "P.D." has been playing pranks with my MS. in last issue, and by means of his apparently very lively imagination made the electric car at Strathpeffer, which I was writing about, upset on the roadside *with a boy*, over and above the driver of the motor.

What I wrote was that the car upset *into the bog*, where it lay, according to report, for about a fortnight before it was rescued from its miry grave. As your Edinburgh correspondent who made the enquiries regarding the alleged electric car may have something to say in your current issue, I will not write further on the subject in the meantime.

### "Emancipation Day" in Scotland.

I UNDERSTAND an effort is being made in the West of Scotland to celebrate "Emancipation Day," 14th November, in an appropriate way. Nothing definite has yet been arranged, but I believe the proceedings will take

the form of a motor-car meet in George Square, Glasgow, with probably a run out into the country thereafter. The idea is, I think, a good one, and should help to let the public of Glasgow see that the automobile industry is still progressing, and may tend to arouse a little interest and enthusiasm in that progressive (apparently in all things but motor-cars) city.

### The Matter of Gears.

HIGH-GEARED cars are a great nuisance when any particularly stiff hills have to be tackled. I had an instance of this last week when visiting a gentleman's place in Lanarkshire.

The approach to the house is down a road which may be an ideal one for tobogganing, but which the driver of an automobile is apt to look at twice before descending, and when he does start on his downward career pray fervently that his hand brake may not fire or his chains break. We all got out of the car, with the exception of "the man at the wheel," to lessen the tension, and after he had reversed his engines he let her go with the clutch disengaged and manipulating the band brake. The descent was made safely, if slowly, and the right angle at the foot (which entirely prevented any insane idea of rushing the hill) negotiated, the rest of the outward journey being plain sailing. But on our return we had that hill to ascend, and it was only in climbing up it, keeping close behind the car all the way to lend a helping hand when necessary, that we discovered what a "tough 'un" it really was. The progress of the car (a Daimler wagonette, weighing considerably over a ton) got slower and slower, until it became absolutely imperative that the four able-bodied pedestrians should exert their muscles on her behalf. The devil-sprag was trailing to prevent any running backward, and for three-fourths of that upward path we had to sweat and pant as we pushed for all we were worth at that over-taxed car. At last the top was reached, and four puffing and blowing specimens were glad to get aboard and have their reward in being taken home the bulk of the journey on fourth speed. In fact, the progress after this was so exceedingly rapid that the current of air set up (for there was no wind) resulted in one of the lamps being blown out. It turned out to be slightly defective (possibly accounting for some of the car's sluggishness in taking the hill), but was soon put to rights, and the remainder of the journey accomplished in a most enjoyable fashion. For flat districts a high-gear car must be a great source of pleasure, but in this "up hill and down dale" country of ours a medium gear is undoubtedly the more useful with which to fit our "flying machine." Talking of gears, a gentleman whom I know substitutes a low gear in the winter time for the high speed one

which does duty on his car in the summer. The idea is a good one if much travelling is done in the winter season, for what with greasy roads or mud, slush or snow, one rarely, if ever, gets on to the top speed. If the gearing is consequently reduced, so as to bring the fourth speed in winter time to the equivalent of the third in summer, one will get more satisfaction and consistent work out of one's car. Better a willing third than a sluggish fourth.

### The Madelvic Cars.

THE Madelvic Motor-Carriage Co., Ltd., whose very extensive works are situated at Granton, near Edinburgh, are still successfully carrying out their mail contract with the Post Office authorities by means of their electric car. There have been comparatively few hitches, but it must be taken into consideration that the distance to be traversed between Edinburgh and Leith is a very short one, and even after knocking a very liberal percentage off the mileage which electric batteries are said to be capable of accomplishing without re-charging, there should always be more than ample energy left to ensure the successful carrying out of the runs. From all accounts the oil motor of Mr. Peck, the managing director of the concern, from which great things were expected, is still undergoing improvement in the workshops. Once it is finally tested and proved, and can be turned out in large numbers, the Company, with their splendidly equipped works, should be in a position to do a big business in automobiles.

### A Hint to Bazaar Promoters.

It is not an easy matter nowadays to introduce novelty into the modern bazaar, and promoters are now almost at their wits' end to get some new thing worked in. Several Scotch bazaars during the last few months have made use of the motor-car as an advertising medium, and from inquiries I am informed that the result has been satisfactory in almost every case. A week or two ago, at Castle Douglas, a motor-car was running about each day conveying parties to the bazaar. Last week two motor-cars were in evidence at Motherwell in connection with the great bazaar held on behalf of the building funds of the Y.M.C. Institute now in the course of erection in that town. Mr. James Burns, hon. sec. of the bazaar, kindly lent his own private wagonette for the purpose of the collection and delivery of goods, and another wagonette for the same purpose was lent by Messrs. Stirling, of Hamilton. A very satisfactory revenue was obtained from these vehicles, as a charge was of course made for delivery of goods purchased at the bazaar. I think bazaar promoters who have not yet tried the motor-car would do well to follow the example of others in this respect.

### Motor Making.

SCARCELY a week is passing just now without the announcement being made that another firm of cycle makers, engineers, or other manufacturers have joined the motor industry and are bringing out something new in the line. This is extremely interesting information, and indicates the belief of the firms concerned in the business that is coming, and their determination to obtain a share of it, and it is only what was to be expected. The "slump" in the cycle trade perhaps hastened in some degree this result, at any rate so far as some of the cycle makers are concerned, who, having a surplus of idle plant, naturally sought something to employ it which held out more prospect of profit. It is very gratifying that so comparatively early in the development of the new industry so many well-known firms of high repute in various departments of the mechanical arts are attaching themselves to it, and I have no doubt that in the course of the next few years many of these concerns will stand in the front rank of motor-carriage makers.

**The Proposed Scottish Club.**

MESSRS. MITCHELL AND SMITH, of Glasgow, who some time ago took up the matter of the formation of the proposed Scottish Club, write me complaining of my remarks on this subject in last week's issue of *The Motor-Car Journal*. As I am in close touch with everything that is going on in the motor-car "world" in the North, as well as in frequent communication with the leaders of the movement in Scotland, I am in a position to speak with knowledge on the subject. If Messrs. Mitchell and Smith will take up the matter energetically, probably the Club may yet be boomed through their agency.

**Some Advice.**

WHEN many persons who, while being skilled in other manufactures, are wholly inexperienced so far as motor-car making goes, are almost rushing into the new business, it may not be inopportune to lay down a fundamental principle which in my opinion should from the outset govern the manufacture of every detail in the construction of motor-vehicles, and that is that as regards the workmanship and the materials used they must be above and beyond doubt or suspicion—they must be of the very highest class, of the very finest description. One has only to consider for a moment the innumerable shocks, jars and strains which are inflicted on a vehicle travelling at even fourteen miles an hour over our ordinary highways, to be impressed with the absolute necessity of makers exercising the most scrupulous care in the selection of their materials: not only that they should be of the right sort and quality, but that they should be of the right weight and strength for the work they are called upon to perform. Especially is this desirable where there is so great a temptation to reduce weight wherever possible, as in the light vehicle class. To many experienced engineers this advice is wholly superfluous, but to many others who are just starting out it may prove useful, and I am sure in the end work out to their profit. Thinking people for some time to come will no doubt be inclined to place their orders with firms who have had the longest experience, but if the younger makers only start out and follow on in the lines indicated they will very soon attract to themselves a large and lucrative business.

"BROWN HEATHER."

MR. W. H. NEWMAN, of Totteridge Park, Herts, writes us this week to the effect that his variable speed gear, which was exhibited at the Richmond Motor-Car Show in June last, has since then been considerably improved. With the driving shaft running at 650 revolutions per minute the driven shaft can be varied in speed from 0 to about 500 revolutions per minute, the apparatus being capable of transmitting about 3-h.p. at that speed. Mr. Newman is arranging to exhibit the device at the works of Mr. P. Hooker, of Pear Tree Court, Farringdon Road, London, E.C., from the 19th to the 25th inst., inclusive, where he will be pleased to explain the apparatus to any one interested.

THE Southern Motor-Car and Cycle Co., of Brixton Road, S.W., inform us that it was through their instrumentality that the Coulthard steam omnibus was brought before the notice of the Auto-Motor Express Co., Ltd., of Ramsgate, and that the order for the vehicle was placed through them.

In connection with the Motor-Car Club's run to Brighton on November 13th, Messrs. Hewetsons, Ltd., of Dean Street, Oxford Street, W., propose to run one of their ten-seated Benz wagonettes with covered top. Early application should be made for seats in the car.

AT Falkirk on Tuesday James Hunter, one of the drivers in the employment of the Falkirk Motor-Car Co., was fined 10s. or seven days' imprisonment for driving a motor-car at a speed greater than ten miles an hour.

**THE LIVERPOOL SELF-PROPELLED TRAFFIC ASSOCIATION.**

THE third annual meeting of the Liverpool Self-Propelled Traffic Association was held on Monday in the room of the Chamber of Commerce, Exchange. Mr. Alfred L. Jones, Senior Vice-President, presided, and amongst those present were Dr. Hele-Shaw (Vice-President), Messrs. F. C. Danson (President Liverpool Chamber of Commerce), S. B. Cottrell (Engineer and General Manager Liverpool Overhead Railway), W. Becket Hill (Messrs. Allan Bros.), Richard Bennett (Liverpool Cart-Owners' Association), Fred. J. Pilcher, H. W. Rushton, W. L. Bodman, T. H. Coleborn, Ernest N. Hooper, P. Souvestre, Henry Fowler, and E. Shrapnell Smith (Hon. Secretary). Lord Derby wrote apologising for his absence, which was due to his departure to London for the opening of Parliament.

The following is the third annual report of the Association:—

The additions to the roll have been 35. Four names have been removed from the register, of which three are due to resignations and one to death—Mr. Thos. B. Brodbelt, Waterloo. At the present date the number of members is 95, compared with 44 and 64 at the close of the first and second sessions respectively.

It is a matter of sincere regret that Mr. Alfred Holt, M.Inst.C.E., Senior Vice-President, has had to resign office, and the Council desire to place on record their high appreciation of his valued services and support during the three years that he occupied that position. Professor H. S. Hele-Shaw, LL.D., F.R.S., M.Inst.C.E., and Mr. Anthony G. Lyster, M.Inst.C.E., Engineer-in-Chief Mersey Docks and Harbour Board, have been elected Vice-Presidents, and Mr. Charles W. Jones, J.P., and Alderman William Oulton, J.P. (the Rt. Hon. the Lord Mayor of Liverpool), members of Council. Mr. J. Walwyn White has been elected Honorary Treasurer. Apart from these changes, the constitution of the Council is in accordance with the elections of July 12th, 1898.

In August, 1898, a fusion was arranged between the Automobile Club of Great Britain and Ireland and the Self-Propelled Traffic Association, but the terms were found to be unacceptable to this centre. Conferences were held in London between a sub-committee of the Club and a deputation of the Liverpool Council, the outcome of which was an arrangement of affiliation under which the following points are defined, viz.:—Title: The Liverpool Self-Propelled Traffic Association, being the local centre of the Automobile Club of Great Britain and Ireland. Subscriptions: Members of the Association pay one guinea per annum as heretofore, which does not entitle them to any of the privileges of the Club, but are eligible for election to the Club on payment to London direct of the ordinary Club subscription less one guinea. The Association pays the London body a fee of half a crown per head per annum for each member upon the local register. Elections: Members of the Association are elected by the local council. Area: The Association's jurisdiction includes Lancashire, Cheshire, and North Wales. The Club will give the Association notice before seeking to establish centres within such area. Termination: This arrangement of association may be determined by either side, on December 31st in any year, by six months' previous notice in writing. Subject to such modifications as are involved in the above-noted arrangement with the Automobile Club, the Association is conducted under the rules and articles of Association of the Self-Propelled Traffic Association.

A statement of the ordinary accounts has hitherto been published at the end of each session, i.e., at a date not co-incidental with the completion of a financial year. It has been decided that the ordinary accounts for the remainder of 1898 shall be merged with those of the year ending December 31st, 1899, in consequence of which the honorary treasurer does not attach any statement of accounts to this report. It may here be stated that the current revenue of the Association is ample to meet all ordinary expenditure. The accounts of the 1898 trials, duly certified by Messrs. Lloyd & Walker, chartered accountants, 5 Castle Street, Liverpool, were published on June 3rd, 1899. The debit balance of £47 9s. 2d. has since been extinguished by sale of reports and other assets of the 1898 account.

The awards of the judges in connection with the 1898 trials of motor-vehicles for heavy traffic were announced on August 12th, 1898. The Session was opened on November 23rd, 1898, by the presentation of the judges' report upon these trials, which were held from May 24th to 27th, 1898. Owing to the large hall of the Royal Institution being engaged, the meeting was held in the Arts Theatre of University College, the use of which was kindly granted by Principal Glazebrook and the Senate. In the absence of the President, the Rt. Hon. the Earl of Derby, K.G., who was unable to be present on account of Lord Lathom's funeral, members and guests were received in the library by the Vice-Presidents, Messrs. Alfred Holt, Alfred L. Jones, and John A. Brodie, prior to the meeting in the Arts Theatre, where the chair was taken by Mr. Alfred L. Jones. The report was presented on behalf of the judges by Mr. S. B. Cottrell, M.Inst.C.E., Dr. H. S. Hele-Shaw, M.Inst.C.E., and Mr. Henry H. West, M.Inst.C.E., each of whom dealt with one or more sections. Sir David Salomons, Bart., and Mr. Boverton Redwood were unable to be present. A number of lantern slides were used to illustrate various incidents of the

competition and the construction of the vehicles taking part, including reproductions of all the plates in the report. The report is the first book published on the subject of heavy automobilism exclusively, and should be in the possession of all interested therein.

Subsequent meetings were held, at which papers upon the several subjects enumerated in the following summary were read and discussed:—December 13th, 1898.—Discussion: "The Judges' Report on the 1898 Trials and the Conditions for the 1899 Trials," opened by Mr. Anthony G. Lyster, M.Inst.C.E. (Engineer-in-Chief Mersey Docks and Harbour Board). January 17th, 1899.—Mr. S. H. Sparkes (Messrs. Fox Bros., Ltd., Wellington, Somerset)—Paper: "Motor *versus* Horse Haulage; an Account of our Nine Months' Experiences." February 14th.—Mr. W. Norris, Assoc.M.Inst.C.E., M.Inst.Mech.E.—Paper: "The Application of Steam to Self-Propelled Road Vehicles." February 28th.—Mr. Tnos. H. Parker, M.Inst.E.E.—Paper: "Some new features in Motor-Vehicle Design." The paper announced to be contributed by Messrs. D. H. Simpson and W. L. Bodman on "Further Developments in Steam Motor-Vehicles for Heavy Traffic," was unavoidably withdrawn.

The average attendance during the session equalled 47 at each meeting.

The session was brought to a successful close by the heavy motor-vehicle competition held from July 31st to August 2nd, 1899. The chief object of the trials was to demonstrate the advance made since May, 1898, in the direction of "types of heavy motor-wagons suitable for trade and agricultural requirements in the neighbourhood of Liverpool, which shall be capable of economically taking the place of horse haulage and of competing with the existing railway rates, in the transport of heavy loads of goods over distances of up to forty miles." The conditions for the trials were published on February 14th, 1899, and it was then announced that the competition would be held five weeks earlier than had been originally contemplated. This arrangement was to provide for the trials taking place in connection with the annual show of the Royal Lancashire Agricultural Society, who offered gold and silver medals.

Out of eleven entries by ten firms, six vehicles were presented for trial, the remaining five not being completed in time. Loads of from two to six and a half tons were carried up the selected hills (maximum gradient of 1 in 9) and over the now well-known Liverpool courses of 35 miles each, with results that show a marked and gratifying advance on those of the 1898 competition. The competing firms were: Bayleys, Ltd., Newington Causeway, S.E.; T. Coulthard & Co., Cooper Road, Preston; the Clarkson and Capel Syndicate, Deverell Street, S.E.; the Lancashire Steam Motor Co., Leyland; and the Steam Carriage and Wagon Co., Ltd., Chiswick. The trials were attended by representatives of commercial interests in all parts of the United Kingdom, including many of the principal railway companies. The Secretary of State for War, the Postmaster-General, the President of the Local Government Board, the Corporations of Bradford, Barrow-in-Furness, Bootle, Birmingham, Birkenhead, Chester, Eccles, Gateshead, Glasgow, Lancaster, Liverpool, Manchester, Salford, St. George (Hanover Square), St. Pancras, St. Mary's (Battersea), Southampton, Waterloo, West Hartlepool, and Willington Quay, the Liverpool Chamber of Commerce, the Liverpool Cotton Association, the Liverpool Corn Trade Association, and numerous other bodies, sent official delegates. The report of the judges is now in course of preparation. The judges' awards were announced on Thursday, August 3rd, 1899, as follows: The Steam Carriage and Wagon Co., Ltd., two gold medals; Bayleys, Ltd., silver medal; the Lancashire Steam Motor Co., silver medal.

The results of the second series of trials having made it clear that an interval of twelve to eighteen months admits of much progress being made in improvements upon the construction of motor vehicles for heavy traffic, it has been decided to organise one more series of trials. It is intended that these shall be held in October, 1900, and there appears to be little doubt that the Association will then be justified in leaving the movement to private enterprise for development upon commercial lines.

*The Present Tare Limit.*—The Council adhere to the resolution contained in their second annual report, viz.:—Resolved: "That the Liverpool Council of the Association is of opinion that the existing maximum of 3 tons tare imposed by the Locomotives on Highways Act, 1896, very seriously hampers and in many cases prohibits the construction of vehicles of the types required for the heavy traffic of this district, and a recommendation is hereby made to the General Council that the whole forces of the Association shall be immediately directed towards the obtaining of an amendment to the Act whereby (a) all restrictions upon weight shall be removed; or, if it be deemed inexpedient to remove all limitations, (b) a limit upon the total moving weight, or upon the weight per axle, shall be substituted for the present limit of 3 tons tare; or if it be considered imperative to retain a limit upon the tare, (c) the tare permissible shall be increased to at least 4 tons."

Owing to the fusion between the A.C.G.B. and the S.P.T.A., this recommendation was not dealt with for some months when it passed into the hands of the Club Committee. In February of this year the Club Committee expressed the hope that the Association would postpone any action until after the Club show and the autumn heavy trials, to which the Council agreed on the 28th of that month. The question came up again at the Council meeting of August 15th, when it was resolved to request the Liverpool members of Parliament to introduce a short Bill to increase the limit from 3 to 4 tons, but, in response to an appeal from the London Club, no action has been taken pending the holding of a joint conference in London. At this conference, which has been called for November 15th, members of the Club Committee, a deputation of the Council of the Association, and representatives of firms engaged in the manufacture of heavy automobiles will discuss the advisability of introducing a Bill.

The Council are of opinion that, even if some manufacturers can build a vehicle to carry 5 tons which shall tare less than 3 tons, it is desirable to have the Act altered to permit of a 4-ton tare, (a) to ensure a reasonable life in regular work; (b) to avoid years of delay in waiting for that lightness of construction which may come ultimately; (c) to give a wider scope to manufacturers who, however, will be prevented from wasting material or introducing excessive weight by the spur of commercial efficiency which demands the highest possible ratio of live load to tare; (d) to provide for loads of 6 to 10 tons which must be carried before the vehicles can be reckoned capable of meeting trade requirements generally; (e) to permit of a vehicle being sold at a commercial price.

The Chairman, in moving that the report be taken as read, said he was extremely pleased to be again present and report what had been done towards the development of the self-propelled traffic industry. What was required in Liverpool was a modern motor-wagon able to deal with the trade of the port, and he thought they were getting closely on to something that might be of great advantage to all interests concerned. The trials and exhibits held by the Association had been to induce manufacturers to produce something which would be of practical service. Messrs. Thornycroft had been exceedingly successful in the last exhibits, and had produced a wagon which would work at half the cost of a horse-wagon, and he believed that that firm had received an order from the Lancashire and Yorkshire Railway Company for twelve of these vehicles at a cost of £600 each. That would show that they were really on the verge of what might be considered a great national industry. He would much like to see factories for the building of these wagons located in Liverpool. There was no place where these wagons would do better and be of more use than in Liverpool, owing to the peculiar way in which their traffic had to be dealt with. Nearly all goods in Liverpool had to be carted, and it would be easily seen by any one that if they could reduce the cost of the carriage by half what a great thing it would be for the port.

Mr. Cottrell seconded, and said the Association had materially advanced the construction of self-propelled vehicles for heavy traffic. He considered makers were working in the right direction. He thought it would be an important point gained if they could obtain sanction for increased tare limit. At the present time the limit handicapped the production and manufacturers. They should make every effort to get an increase in the tare limit.

Mr. Richard Bennett said the cost (£600) of manufacturing a vehicle was too much. They could get a good horse-wagon for £200. He thought engineers should give their attention to manufacturing these machines at a less cost than they did.

The Chairman remarked that inventors liked to be paid for their inventions. There were many advantages possessed by the motor over the horse-wagon.

Mr. Shrapnell Smith remarked that one motor would do the work of four horse-wagons.

Mr. Beckett Hill, in a speech highly favourable to the motor, said the life of a horse averaged only about five or six years, while the motor would last much longer.

The report was then adopted.

Mr. F. C. Danson moved a vote of thanks to the Hon. Secretary and other officers of the Association. Mr. Shrapnell Smith's work could not be over-estimated. He hoped the annual trials would still go on, as they could not expect to find perfection in three years. These tests had done more than anything else to promote the development of heavy motor-cars, and they had more than justified the existence of the Association.

The resolution was adopted, and at the conclusion of the proceedings a vote of thanks was accorded to the chairman on the motion of Dr. Hele-Shaw, seconded by Mr. F. J. Pilcher.

A MEETING of the Automobile Club of America, of New York, was called for Monday last, the 16th instant, to receive the report of the acting executive committee, the constitution, and by-laws.

## THE EADIE MOTOR CYCLES.

REFERENCE to the accompanying illustration will indicate the lines which have been adopted by the Eadie Manufacturing Company, of Redditch, in their motor-cycles. The motor employed both in the tricycle and quadricycle is the well-known De Dion-Bouton of 2½-h.p., the most efficient high speed engine yet designed; it is located behind the axle in the manner generally followed. The axle balance gear and bridge, which has been adopted by the Eadie Co. after mature consideration of all existing types, possesses the essential features of rigidity of construction, simplicity, and ample proportion of bearings and gearing. A tendency has been displayed in some quarters to deride the bridged axle, as shown in this design, in favour of the tubular bridge. It is claimed that the principal reason for the more utilitarian character of the bridged axle lies in the feature that it provides for the independent adjustment of the bearings. In the type of axle as adopted by the Eadie Co. the adjustment of any or all of the bearings affects only the position of the ball on the cone. In the tubular bridge type, however, the axles are drawn respectively to the right and left by the adjusting cones, which are placed at each extreme

THE EADIE MOTOR-QUADRICYCLE.

end, this action having the effect of drawing the bevel gears attached to either end of each axle out of mesh with the driving pinions, and if prolonged indefinitely would make movement impossible. The bearing cases are rigidly connected by tubular sleeves of ample proportion; this fact, in conjunction with the methods of construction and special devices employed in the frame building department of the Eadie works, ensures absolute correctness in these essential particulars. A point to which attention is particularly drawn is that no bevel wheels whatever are employed in the balance gear, the wheels being all face cut and of such form as to ensure the utmost freedom of action combined with the greatest possible margin of safety. The front forks of the tricycle have always been considered by cycle designers as presenting more difficulties in correct proportioning of the various parts than any other part of the frame of a cycle. These difficulties, which are serious in ordinary cycle construction, are accentuated in the case of motor-vehicles on account of the additional vibration and heavier weights involved. The Eadie Co. inform us that the fork used on their motor-tricycles was designed at a time when there were but few devices sufficiently strong to withstand the severe usage to which pacing machines were subjected. It is especially efficient as regards lateral rigidity. Band brakes

are provided both on the front wheel axle and on the rear axle. The wheels are of strong construction, and are equipped with pneumatic tires.

The Eadie Co.'s two-seated motor-quadricycle comprises an extremely rigid frame. The front seat is very comfortably arranged and suspended, and, in addition to the usual band brake, a double shoe brake acting on the driving wheel tires is fitted, this being worked from a second lever on the opposite side of the handle bar to that from which the band brake is applied. The motor is of the latest pattern 2½-h.p. De Dion type, the construction throughout being of the highest possible grade.

In addition to supplying motor-tricycles and quadricycles complete, the Eadie Co. are arranging to supply the frames for the same, to which firms may apply the motor, etc., themselves.

THE Woods Motor-Vehicle Co., of East Orange, N.J., has been licensed to do business in Illinois, with a capital of £13,000.

THE Hudson Gas Motor and Vehicle Manufacturing Co. has just been formed at Saratoga Springs, N.Y., U.S.A., with a capital of £20,000.

THE Erie Cycle Co., of Anderson, Ind., is to be added to the number of American concerns which will make automobiles.

AN American correspondent in Paris reports: "One may sit at a boulevard café, and see one hundred or more motor-tricycles pass in one direction during an hour or less."

MESSRS. FALCONNET, PERODEAUD & Co. of Choisy-le-Roi (Seine) are distributing an interesting and useful pamphlet entitled "Conseils pour la Conservation et L'Entretien des Roues Caoutchoutées."

THE Tyne Motor-Car Company, Ltd., has been registered with a capital of £10,000 in £1 shares to acquire the business now

carried on under the style of "The Tyne Motor-Car Co.," to manufacture, sell, let on hire and deal in motors, motor-cars, and cycles of every description. The registered office is at 14 High Friars Street, Newcastle-on-Tyne.

A LONG-DISTANCE ride on horseback from Berlin to Totis, not far from Budapest, a distance of 470 miles, was commenced on Monday morning from the Tempelhoferfeld. The competitors, who are mostly cavalry men, were accompanied by bicycles and motor-cars, which are to serve as pacemakers and to carry luggage.

MR. W. H. CHAPMAN, electrician of the Belknap Motor Co., Portland, Me., has recently introduced a light electric carriage. The vehicle complete weighs 360 lb., of which 180 lbs. is battery, and is intended for a light racing machine, carrying one person normally and two on smooth roads. When only one person is riding an extra battery may be carried, bringing the mileage on one charge up to 40 or 50 on good roads, the normal mileage being about 20. The frame rests on four 32-in. tandem bicycle wheels, with 4-in. tires. Two ½-h.p. motors are used, each geared to the rear wheels by a 10-in. gear and run independently of each other in the ratio of 10 to 1. The steering lever is in front at the right, and the manipulating lever is in front of the seat.

## ANOTHER COMBINATION ELECTRICAL AND PETROLEUM-SPIRIT MOTOR-CAR.

**B**Y combining the petroleum-spirit engine with an electric motor for vehicle-driving the engine can, it is claimed, be made lighter than that required to alone drive the vehicle up the heaviest grades. The disadvantage of poor starting apparently inherent in the petrol-motor can, it is further claimed, be entirely overcome, and the motor and battery can be made much lighter than

though they alone were required to supply the full power, as the battery is alternately charged and discharged at short intervals from the engine, and is not dependent upon power houses for charging current. We have already referred to the Pieper electro-petrol car, while now we learn that a vehicle driven in this manner has lately been put on the market by the Munson Company, La Porte, Indiana, U.S.A. The engines are horizontal and of the twin-cylinder type, with balanced cranks and electric ignition. The igniters are supplied by the storage battery connected with the dynamo and fitted with spark coils specially wound for high pressure (40 volts). To prevent the grounding of the circuit both contacts of the igniters are insulated from the engine castings.

Coupled to the engine shaft is the generator or motor, which is of the external armature type, narrow and of large diameter in order to obtain maximum fly-wheel capacity with a given weight. The dynamo has a ring armature with a series or two-circuit winding and a radial or disc commutator. The internal field has six poles energized by a single field coil, shunt-wound and divided electrically into two halves, connected respectively to each of the two trays of storage cells, so that the series multiplying of the trays does not affect the field excitation. The dynamo is enclosed in a dust and moisture-proof casing.

Two sizes of dynamos have so far been made, one rated at 3 h.p. and the other at 5 h.p. The smaller machine has a speed of 360 revolutions per minute when running free on 80 volts; its weight is 300 lb. and its dimensions are 18 in. external diameter by 8½ in. width over all. The larger machine has the same speed, slightly larger dimensions, and its weight is 425 lb.

By means of the controller the two trays of the battery can be connected either in series or parallel, giving to the motor two speeds, one double the other, as the machine is shunt-wound, and a further speed variation is obtained by means of a changeable gear. This gear is changeable in a ratio of four to one, so that there are two speeds on each gear, giving four speeds to the vehicle altogether. A reversing switch is used for backward movements by means of the motor alone, there being two reverse speeds. There is one resistance position of the controller with the batteries in parallel, and also one when they are in series, but the controller mechanism is not fitted with notches in these positions.

With the larger-sized motor two makes of battery have been employed, one outfit weighing 800 lb. and rated at 100 ampère-hours at 80 volts; the other weighing 650 lb. and rated at 75 ampère-hours at the same pressure. Owing, however, to the quick recharging of the battery as soon as the driving of the vehicle requires less power than the engine generates, it has, the makers state, been found that a much lighter battery can be used and give proper results. Both pleasure vehicles and delivery wagons have, we understand, been built with driving gears of this kind.

The Lewis Motor-Vehicle Manufacturing Company has been formed in Philadelphia, with a capital of £10,000. Incorporators: H. H. Simpers, L. Pyott, D. C. Clarke, J. W. Graham, all of Philadelphia.

## THE FATAL MOTOR-CAR ACCIDENT AT EDGE HILL.

THE adjourned inquest on the body of Nina McLeod, housekeeper at Rodway Grange, near Kineton, who was killed in a motor-car accident near Edge Hill three weeks ago, was held at Rodway on Friday last week. The Coroner (Mr. Thomas Christophers) explained that the enquiry had been adjourned for the attendance of Albert George Breakwell, the driver of the car, and who was in the employ of the British Motor-Coupé Company. It was thought the driver would know more about the accident than any one else. The Coroner cautioned Breakwell as to the serious nature of the enquiry, and said it might result in him being committed to take his trial on a charge of manslaughter.

Albert Breakwell deposed that he had had many years' experience as a driver of motor-cars, and during the week of the accident he had tested and tried the car to which the accident occurred. It worked very satisfactorily, and the top speed at which the car was geared was twelve miles an hour.

The Coroner: Is not that the limit allowed by the Local Government Board?

Witness replied that he thought fourteen miles an hour was the limit. Edge Hill was most dangerous, and he took special precautions in going down it at about ten miles an hour. Later in the day witness took a larger party out in the car, including the deceased. All went well until coming down Edge Hill again. Then for some reason the accident occurred. The car went suddenly on to its side, skidded, and travelled about another thirty yards, when it went on to its side again and upset. This was all witness remembered as he was rendered unconscious. The brakes were sufficiently powerful to pull the car up within its own length on the level or within a reasonable distance on a decline. When he commenced to descend the hill he had the car under control by the foot brake, which would not stop the car so quickly as the hand brake, the latter, however, being only intended for use in case of emergency. Witness tried the car in the morning, but did not remember doing so later. Until a week before the accident witness did not know the deceased. He added that nobody had anything to do with the control of the car but himself. The fact that one of the party sat next to him did not attract his attention from his work, nor was there any "larking." He had driven gentlemen hundreds of miles.

The Coroner: I don't think there is any doubt in the minds of the jury as to your ability. It is right you should also know that another witness has said you were quite sober.

Witness: I should be very sorry to attempt a drive a motor when in drink.

Several excellent testimonials were read as to witness's character as a driver.

Augusta Ehrdard, maid to Mrs. Haig, said that she had a seat in the car. It was not going fast when coming down the hill. A dog got out of the car and they went back for it. It was upon returning that the accident occurred. She did not notice the speed at which the car travelled, a ride in a motor-car being a new experience for her. She was thrown into the road, and her shoulder was fractured. She saw the butler, Mr. Metcalf, lying unconscious in the roadway. Witness admitted that she told Dr. Fenton after the accident that the car was travelling thirty miles an hour.

The Coroner said he had treated this witness as hostile, because it was quite clear to his mind that there had been a desire to keep back from the enquiry evidence which was material.

Several other witnesses were called to speak as to the speed at which the car was travelling. Thomas Rushwood, gardener, said it was "pretty fast," and Ann Barnes stated that it was "alarming." She prophesied that an accident would happen. Two other witnesses said the pace was from thirty-two to thirty-six miles an hour.

The jury returned a verdict of "Accidental Death," and severely censured the driver.

## MOTOR-CYCLE RACING AT THE CRYSTAL PALACE.

THE third motor-tricycle race, duration one hour, for the Crystal Palace Brossard was decided on the track on Saturday last, but owing to some slight accidents to two of the machines, the event was practically a walk-over for Mr. C. G. Wridgway. On the previous occasion Mr. S. F. Edge proved successful, after a hard fight with Mr. C. Jarrott, but on Saturday the last-named did not take part in the race, and the holder, after leading for a mile and a half, was dropped. Mr. F. Wellington officiated as judge, and Mr. F. W. Baily (Motor-Car Club) took the times. Owing to the overhauling of the machines, it was some three-quarters of an hour after the advertised time that Edge and Wridgway were started, Edge taking the lead. At a mile and a half Edge's machine slowed, and Wridgway quickly gained a lap, which advantage he increased to two laps at three miles. When the leader had covered four miles Edge dismounted for a change, and Wridgway, sailing away, was ten and a half laps (three and a half miles) to the good. At nine miles Edge was off again, and from this point practically retired. Wridgway covered 17½ miles in the half hour, and 34 miles 450 yards in the hour. Immediately after the finish, both Edge and Jarrott challenged the winner according to the rules of the competition. Wridgway's principal times were: Five miles, 8 min. 42 sec.; 10 miles, 17 min. 18 3-5 sec.; 15 miles, 23 min. 59 sec.; 20 miles, 34 min. 39 sec.; 25 miles, 43 min. 43 sec.; and 30 miles, 52 min. 30 2-5 secs.

## THE AUTOMOBILE ASSOCIATION.

At the West London Police-Court on the 13th inst. Mr. W. H. Stephenson, applied on behalf of the Automobile Association, of Holland Park Avenue, for a warrant, alleging that motor-cars of the value of £5,000 had been taken away from the premises between seven o'clock at night and three the next morning. He stated that the police were present, and it was added that the cars and motor-bicycles were being removed to a new depot in Hammersmith.—Mr. Plowden: Do you suggest that they have been stolen? Taking them away would not amount to a felony.—Mr. Stephenson submitted that there was strong evidence of a conspiracy to defraud the Company. Property of the value of £5,000 had been sold for £1,600, payable with £50 down and the balance in nine and twelve months.—Mr. Plowden said there might be some irregular proceedings in the matter, but behind there must be a claim of right. He asked why an explanation had not been requested of the parties against whom the application was made.—After some further remarks from Mr. Stephenson, the magistrate said it all appeared exceedingly wrong and irregular, but he saw no ground for the allegation that a felony had been committed. In the end he (Mr. Plowden) declined to grant a warrant.

In connection with the above matter, we have received the following letter from Mr. Sydney Atkins, of the Automobile Association:—"A number of our motor-cars having been (as we allege) improperly removed from the premises of the Automobile Association, Ltd., we have commenced an action for injunction and damages against the parties removing the same, and obtained an injunction against the same parties from using, selling, dealing with, or disposing of same. In the meantime we are obtaining a fresh stock of cars, as the contracts entered into furnish us with cars almost daily, and we are therefore all the same in a position to supply motor-vehicles on the shortest notice, as in the past."

## A MOTOR-CYCLE SMASH.

TILLING'S, LIMITED, v. LONDON AUTOCAR CO.

IN the Southwark County Court, on Tuesday, his honour Judge Addison, Q.C., heard a case brought by Tilling's, Limited, the well-known jobmasters and omnibus proprietors, against the London Autocar Co., 182 Gray's Inn Road, W.C., to recover damages for injury to a brougham caused by the alleged negligence of a driver in the employ of the defendant company.

Mr. Salter, in stating the case for Tilling's, Limited, said that on the day of the collision his clients' brougham was being driven to Waterloo, having Mr. Peter Keary, one of the managing directors of Pearson's publications, inside. The brougham had gone over Waterloo Bridge, and was stopped by the police where York Road runs across, it being then facing the Waterloo Road. The defendants' motor-cycle came up York Road from the direction of Westminster Bridge, and having reached the junction turned round to retrace its way and was going back again. The traffic was released and the brougham turned out into York Road, and was then proceeding with the motor-car slightly in front of it. The two vehicles thus went along until they came under the railway bridge, and at that point the motor-car suddenly made a loud noise, stopped short, and swerved out into the middle of the road—whether from the negligence of the driver or from something going wrong he could not say. It was a four-wheeled tricycle, with a petroleum motor: one of those things that go puffing along. The horse was upon it as soon as it swerved and began plunging about, with the result that damage to the extent of £10 8s. 6d. was done to the brougham; and the plaintiffs also sued for £1 5s., the loss of the horse's keep during a period of rest.

The driver of the brougham, named Pine, deposed that he had been a driver for twenty years, and having borne out counsel's opening statement said the motor-cycle crossed in front, and on the other side. The horse jumped and pulled the brougham over the motor-car; the driver of the latter fell; the passenger jumped off.

Cross-examined by Mr. Glasgow, he said there was a noise as though something had burst.

Mr. Peter Keary, who was inside the brougham, said he was observing the motor-tricycle as the traffic was going on. When the accident happened it was absolutely in front, and the horse put its foreleg upon it.

Cross-examined, he thought the motor-car was to blame. The brougham was crawling along.

Garwood, a cabman, in his evidence said the thing looked very like a practising or trying machine. He noticed the driver sounded his trumpet.

Counsel explained that was a kind of horn, but that did not quite appeal to the cabby, and ultimately all agreed with the Judge, who suggested that the driver sounded something on the motor-car.

Continuing his evidence, the cabman asserted that he saw the motor-tricycle shoot out all of a sudden in front of the brougham, and before the driver could pull up he was on top of the machine.

C. J. Johnson, an omnibus driver, Police-Constable L.R. 29, and Edgar Cole, the yard foreman at Messrs. Tilling's, also gave evidence.

For the defence, David Edwards, the driver of the quadricycle in question, was called. His business, he said, was to drive motor-cars to

show customers. He had been with the London Autocar Co. for nine months, previous to which he had been with the Motor Manufacturing Co. He had been engaged in engineering since he left school, and understood the construction of the machines. On the day of the accident he was driving Mr. Percy Walker to Waterloo Station, and just before the collision was pedalling the machine as an ordinary cycle at a speed of four or five miles an hour. Suddenly he felt a distinct jerk, the machine was swung round, and he was knocked off under the car. Simultaneously with the jerk he saw the horse's head in front of him. The car was in perfect order.

Cross-examined by Mr. Salter, he said he was not in the middle of the road, and the engine was not working.

Mr. Percy Walker, who was on the quadricycle at the time, said he caught sight of the horse's head, and felt a blow on the car immediately before it was swung round. The driver had been pedalling for some time before.

Mr. Charles Rush, manager of the London Autocar Company, said the sale price of the machine was £105, and that was the second time it had been out. It had cost £12 to repair, and with £10 for depreciation he counter-claimed for £22.

In reply to questions from the Judge Mr. Rush described the action of the motor, and after T. Simmons had deposed as to the perfect nature of the steering gear counsel replied.

For the defence Mr. Glasgow pointed out variations in the evidence of the plaintiffs' witnesses. He had no witnesses who saw the accident, because it took place behind the driver's back. The driver of the brougham, however, heard a bursting noise and the tire had actually burst at the same moment that the cycle was swung round. The tire was struck by the axle of the brougham and burst. The axle was also bent, and that had caused it to act as a drag on the machine. His view that the accident was caused by the blow from the brougham was consistent with the appearance of the horse's head on a level with the passenger of the quadricycle.

Mr. Salter having replied, the Judge gave a verdict for the plaintiffs for the amount claimed, and dismissed the counter-claim.

## MORE PROSECUTIONS FOR ROAD RACING.

AT Spalding Police-Court on Tuesday, before a full bench of magistrates, F. R. Goodwin, of Newcastle, the holder of the twelve hours and other long distance cycling records, was summoned for riding a bicycle furiously to the danger of the public. The occasion was Goodwin's recent ride of 244 miles in twelve hours. The defendant did not appear in answer to the summons. The Bench decided to require the defendant's personal appearance, and decided to issue a warrant if he failed to attend the next Court. The magistrates also suggested that proceedings should be issued against those in charge of the motor-vehicles by which defendant was paced.

## A FURIOUS DRIVING CASE AT HARROGATE.

AT the Harrogate Borough Court on Tuesday, Mr. Ambrose Valentine, consulting engineer, of Leamington Spa, was summoned by the police for driving a motor-car furiously in Parliament Street, Harrogate, on the evening of October 7th, when a little boy was knocked down by the car. Witnesses were called by the prosecution, who stated that the defendant was going faster than he ought to have done. One of the witnesses estimated the speed at ten or eleven miles an hour. Mr. Crowther Davies, who defended, denied furious driving, and said that before going down the street the defendant blew the horn and moderated his speed. The boy ran out of a by-street into the motor-car, and was knocked down. The defendant also denied furious driving, and said that the surface of the hill was so rough that he was always compelled to go slow at that point. The Bench were of the opinion that the case was proved, and imposed a fine of £1 and costs.

ON Wednesday a lad was run over by a motor-car that commenced plying between Doncaster and Bentley on the previous Saturday.

We learn that not only are Messrs. Aalbrecht & Co., cycle makers, of High Street, Ramsgate, and High Street, Broadstairs, arranging to carry a stock of motor-car spirit and other accessories at both their depôts, but that they are also laying themselves out to undertake repairs to motor-vehicles.

MR. J. BURNS, of 44 Berners Street, Oxford Street, London, W., is now laying himself out to meet the requirements of automobilists in the way of electrical accessories on a large scale. He has sent us a number of leaflets describing among other articles the E.S. dry cells, accumulator induction coils, transformer coils, contact breakers, ampere and volt meters, sparking plugs, lamps, switches, etc. An illustration is given of a novel combination Mr. Burns is introducing, viz., a combined horn and lamp.

# THE Motor-Car Journal.

VOL. I.]

LONDON, FRIDAY, OCTOBER 27th, 1899.

[No. 34.

Published Weekly by CORDINGLEY & CO., 39 & 40 Shoe Lane, London, E.C.

## COMMENTS.

IT is with great satisfaction that we witness the great change which is taking place in the views regarding automobilism and automobiles, expressed by what we may term the "outside" journals and especially those partly, if not wholly, connected with horses or with sports and pastimes in which the horse takes a prominent part. *Country Life Illustrated* is the latest periodical to acknowledge that "slowly and surely the cult of automobilism is gaining ground. The number of self-propelled

vehicles," remarks our contemporary, "one sees upon the road is increasing almost daily, and it is not unsafe to prophesy that before next summer has come round the automotor, in one form or another, will be a regular feature of our highways. Naturally it will have to live down the prejudice that has always to be reckoned with where any threatened innovation is in question, but history will repeat itself in this connection as it has done with so many drastic changes in our social life. The motor-car has come to stay, and its general adoption is only a question of expense when once its advantages have come to be appreciated and initial prejudices have been conquered." Even as regards the question of cost our contemporary considers that this is, if anything, in favour of the self-propelled vehicle, while as regards convenience the motor-car scores considerably.

Any Excuse  
Better than  
None.

WALES is often extolled as a country where education has reached the highest pitch of excellence and where intelligence is plentifully distributed among the people. But, if recent experiences in connection with motor-car matters

at Aberystwith and Aberdare are to be regarded as typical of the Principality, a little more common-sense will have to be imported, or somehow given to those seated in authority. The Aberdare Motor-Car Co. was lately formed to run automobiles for hire in public thoroughfares. Elsewhere licences have been freely granted, and the public have shown appreciation of such services. Bearing that in mind the Hackney Carriage Committee of the Aberdare Urban District Council recommended that licences be given for four motor-cars. Mr. Rees Llewellyn opposed, not only because such cars were dangerous but because the brakes now on the road are driven by old colliers who had been injured, and if the motor-cars were introduced these men would be thrown out of work—a clear recognition of the superiority of the automobile. Mr. Howells regarded the present brakes as nuisances, and others joined in the controversy *pro* and *con*. Ultimately the matter was deferred, and the advocate of the colliers as drivers must be congratulated on successfully blocking an improvement—for awhile.

A Curious  
Position  
at Aberdare.

SINCE the foregoing was written the question of granting licences for public motor-car services has taken a new turn, for on Tuesday night a public meeting of Nos. 1 and 2 Wards was held to oppose the granting of licences to the motor-cars introduced into the town. A resolution that an appeal be made to the Aberdare District Council to refuse to grant licences for motor-cars to any private individual or public company, but that the Council themselves should provide and run motor-cars for the benefit of the ratepayers, was proposed by Mr. Arthur Thomas, seconded by Mr. Rees Davies, and supported by Mr. P. D. Rees, the miners' agent. Mr. W. D. Phillips, secretary of the Motor-Car Company, said it was agreed that better means of locomotion were required, and as no one else seemed disposed to move in the matter his Company had determined to provide such improved means. The resolution was, however, carried by a large majority, and a deputation was appointed to wait on the Council. The position is, therefore, a peculiar one, for while on the one hand the District Council is opposed to the granting of licences because it will throw out of employment the drivers of the horse-drawn brakes, the inhabitants of the town want the motor-car, but wish it to be municipalised. The position of the Motor-Car Company is, therefore, just now most unenviable. What the outcome will be time alone will show.

Are American  
Automobiles  
Too Light?

THE relative lightness of the Whitney and Stanley steam-carriages have been the cause of much comment on the part of English automobilists since these vehicles began to make their appearance on this side of the Atlantic. This lightness appears to be a prevailing feature of American automobiles—a feature, however, which is not meeting with the approval of the New York *Horseless Age*. In commenting on this matter our contemporary recently remarked: "Many of our inventors and manufacturers are producing vehicles altogether too light for the service required of them. The public, they contend, demands light carriages, and we must give the public what it wants. But it is not always wise to humour the public, for the public is fickle and inclined to change its mind suddenly when it discovers that it is wrong. Hence it is manifestly the true policy, when the public is not sufficiently informed, as in motor matters, to look further ahead and build machines which will give permanent satisfaction, knowing that the public will see its error eventually and choose the solid and substantial thing. A little ephemeral popularity is dear-bought if it is followed by failure and loss of reputation." In its last issue to hand, the same journal, in commenting on Mr. Thornycroft's recent British Association paper, returns once more to the question. "English work wagons no doubt seem heavy to our American inventors who are endeavouring to build durable vehicles out of cobwebs and pipe stems, but Mr. Thornycroft, it will be seen, regards them

as too light to meet the commercial conditions. If in England where the roads are comparatively good such weights are found necessary, what weights will be required for American cobblestones, pitch-holes and muddy or sandy highways?"

#### Motor-Cycling in Algeria.

THE motor-cycle is now making its appearance in Africa, the accompanying illustration depicting Mr. S. E. Guy, of Algiers, mounted on his machine. In a letter in hand from Mr. Guy he states that he would like to receive from English builders of light motor-cars and cycles par-

ticulars of their vehicles, with prices, delivered either at Algiers or at Newport, Mon. Mr. Guy's full address is, "care of M. Prosper Durand, Algiers, Algeria."

#### The Proposed Ladies' Automobile Club.

THE meeting at Lady Harberton's house at 108 Cromwell Road, W., in connection with the proposed Ladies' Automobile Club was duly held on Friday evening last, the 20th inst. Mr. J. S. Harvey presided, and among those present were Mr. and Mrs. Buttemer, Miss Isabel Piggott, Mr. C. Cordingley, Mr. E. M. Bowden, Mrs. Sonneborn, Mr. and Mrs. Battinson, Mrs. Bazalgette, Miss Fazan, Miss N. G. Bacon, Miss Drew, Miss Unwin, Mr. Wellington, Mr. F. Vivian Hallett, Miss C. Crates, Mrs. Masters, Mrs. Sallmans, Miss Gibson, Miss Shaw, Hon. Coralie Glyn, Miss Gurney and Miss A. Gurney, Mr. J. C. Horobin, Mr. and Lady Isabel Margesson, Mr. T. Harrington Moore, Miss Frances Lord, and Miss Penderell-Moody. Among the letters read was one approving of the venture from Sir Francis and Lady Jeune, who have recently been enjoying an automobile tour. Madame Sarah Grand and the Duchess D'Uzès also sent their good wishes. The Chairman explained that owing to the action of the Automobile Club of Great Britain in practically excluding ladies from membership, it had been thought desirable to start a club for ladies only. This idea, however, had not been taken up with quite so much enthusiasm as was desirable, and so it was now proposed to admit gentlemen to the new club. A resolution expressing the desirability of forming a committee of ladies and gentlemen who would undertake the initiation of a club for both sexes was carried, and the question of organization was adjourned. During the course of the meeting three short papers were read by respectively Mrs. Bazalgette, Miss Fazan and Miss Bacon. We print the two latter in our columns of the present issue, pressure on our space compelling us to hold over Mrs. Bazalgette's paper until next week.

#### Motor-Cars in Gloucestershire.

A LONG discussion on the speed of motor-cars took place at the last meeting of the Gloucestershire County Council. The Chairman considered twelve miles an hour was a great deal too high a pace to be used on a public roads. Ten miles an hour he thought a very good speed for use on the roads. Another member remarked that "at present these motor-machines went 'whizzing' about the country practically at any pace they liked, endangering the lives of other subjects of her Majesty who for the moment were using the roads." Eventually a resolution was adopted setting forth the desirability of the speed of motor-carriages being brought in line with that of horse carriages, and that they should be numbered in a conspicuous manner.

#### The Run to Brighton.

FROM all we can hear, the run of the Motor-Car Club to Brighton on Monday, the 13th prox., will be a great success, and already the owners of more than a hundred cars have signified their intention of being present. The arrangements are well in hand, and those who have not yet signified their acceptance of the Club's invitation to motorists should do so before November 6th. At 10 a.m. on the morning of the 13th prox. the meet will take place at the Hotel Metropole, London, and the start will not be delayed. At the White Hart Hotel, Reigate, a luncheon will be provided, and the banquet at the Hotel Metropole, Brighton, at 8 p.m. promises to be an important and brilliant function, attended by all the leading motor-carists and motor-cyclists in the country. Given good weather, the third anniversary of the repealing of the Act which prevented the use of automobiles in Great Britain will be celebrated in a way that should demonstrate to the public, most emphatically, the possibilities of the motor-car.

#### "Who Pays the Damage?"

AN amusing incident is related by a correspondent of the *New York Horseless Age* in an account of a motor-car trip from the White Mountains, through the Connecticut Valley, to New York. "One driver whom I met," states the correspondent in question, "on my trip through New Hampshire had a mind of a decidedly practical turn. He was a Hebrew peddler, and was driving a poor, jaded creature attached to a heavily-laden wagon. On seeing the motor-carriage approaching, he excitedly raised his hand as a signal to stop, which I did at a distance of probably 300 ft. As the horse showed no signs of fear and the man seemed to be waiting for something, I called for him to come on, when, with a characteristic gesture, he said: 'Vell, if I come on, who pays the damage?' The man's eye for business was beautifully illustrated by this incident, but it is needless to say that the question of damage had no chance to arise."

#### The Ladies' Papers.

THOSE periodicals issued for the instruction and amusement of the fair sex are bearing evidence of the universal interest in automobiles. In one of the recent autumn fashion numbers we read of a "cloth skirt of automobile red"—evidently a compliment to the fiery hue of the car upon which the Hon. C. S. Rolls navigated the tortuous paths at the Crystal Palace in the spring; and in several fashion plates we have noticed ladies on motor-cars depicted in most becoming costumes. This partiality of ladies for automobile red, which has been a marked feature of the Paris season of 1899, is dealt with in some of the American fashion journals in a very halting way. They wonder whether American ladies will be similarly inclined; others are less hesitating, and one boldly declares, "Our society has a bit of originality, to say the least, and may let the French have a monopoly of the automobile red."

**Motor-Cars at Honolulu.**

In a recent issue we referred to the fact that motor-cars were being introduced at Martinique, in the West Indies. We now learn that a Company has just been formed at Honolulu with the title, The Automobile Company, of Hawaii, and with a capital of £400,000, to introduce electric vehicles in the Hawaiian capital. A charging plant will, it is said, be installed, capable of supplying 100 carriages. Thirty electric vehicles have already been purchased in America.

**Lady Jeune on Motor Touring.**

LORD AND LADY JEUNE have recently experienced the delight of a motor-car tour, and in Saturday's *Daily Telegraph* Lady Jeune had an article on motor touring, in which she said, "There is no more delightful mode of seeing England than driving through it on a motor-car." We are glad to see so distinguished a leader in social circles publicly acknowledge her interest in the new means of locomotion, and

A REMINISCENCE OF THE RECENT BORDEAUX-BIARRITZ RACE.—THE HON. C. S. ROLLS ON THE WINNING "TOURIST" CAR.

the way in which she meets the charge against motorists of frightening horses is decidedly good. "If the poor, tired horse," says Lady Jeune, "who suddenly finds himself lashed furiously, or jobbed in the mouth by a nervous driver, could only speak, he would ask to be allowed to meet his rival face to face, when a few moments of tranquil contemplation would reassure him that the much-dreaded motor was less to be feared than his master."

**Motor-Cars in India.**

AN American contemporary publishes a letter from an Indian correspondent, Mr. Sakharam Martand, of Dhar, Central India, in which this gentleman states that he is convinced that it is possible to get a strong, reliable and economically working car answering his purpose. "But I don't know what firm can supply my want. I therefore give below the particulars of my requirement, and shall feel obliged by your kindly informing me the name of the firm you think most able to do the work. I have to use the car on passenger service daily on a road which is ordinarily metalled. The particulars are as follows:—1. The car must carry 40 passengers and their luggage of 20 lb. each. 2. Its speed per hour should be from 10 to 15 miles on level road. 3. It must be capable of running daily at least 70 to 75 miles with full load and without strain on the machinery. 4. The gradient on the road on which the car will have to run is at the highest 1 in 25, or 4 per cent. The carriage must go over these easily at the rate of 6 to 8 miles per hour.

5. During the rainy season the road is metalled two miles a time. The car must run without strain over the metalling at the rate of 8 to 10 miles to the hour. 6. The machinery should be such as could be handled by an ordinary mechanical engineer. 7. The traction may be by steam or by oil motors. In the former case wood must be capable of being used as fuel." Probably the builders of heavy steam vehicles in this country will send Mr. Martand particulars of their productions.

**Motor-Car Dangers.**

"PAZIENZA," writing to the *Spectator*, suggests that "probably nothing will be done (to effectually regulate the pace of motor-cars) till a Royal Prince breaks his neck or a celebrated beauty her nose." We sincerely hope the position is not so bad as that, for a Prince with a broken neck or a beauty with a dislocated nose would be sorry spectacles for the public—besides the inconvenience to the parties thus brought into range for universal sympathy. The remedy lies largely with the owners of horses, and even at the risk of appearing to give undue reiteration to the advice we would urge all horse owners to get their steeds accustomed to automobiles. The owners of the latter will gladly give opportunity for such education, and by such action being universally followed the likelihood of danger will be practically destroyed.

**A MOTOR-CAR TRIP TO BRIGHTON.**

MR. G. D. BARNES, of Brondesbury, N.W., has favoured us with the following short but interesting account of his recent automobile trip to Brighton: "On Saturday, October 14th, I took my second son for a run to Brighton, leaving Willesden Green at 9.30 a.m. My car is a Benz 8-h.p. dog-cart built to seat four persons, but I often take six. We ran through Kilburn, down Edgware Road to Marble Arch, but owing to the wood-paving being up had to go through some back streets, eventually turning into the Park at Grosvenor Gate, then through Hyde Park Corner to Grosvenor Place, passing Victoria Station, then over Vauxhall Bridge—which seems to be a temporary structure, and very congested with traffic—thence to Oval, Kennington Park, Brixton Hill, making slow progress owing to usual road traffic—buses and those bugbears trams innumerable. Owing to the very sensible form of rubber tires fitted by the Benz firm, the tram lines do not affect the running of the car. It did not skid once or get any twisting motion, but ran on and off the tram lines almost as if on a good, level road. The tire is very broad and flat. Continuing on through Streatham and Croydon—I might say endless Croydon—and then the country on to Merstham, the time being 11.15, which, as Willesden Green is five miles from Hyde Park Corner, makes about 25 miles in 1½ hours. The country was looking lovely, the autumn tints showing to perfection, the sun shining, the roads (after Croydon) perfect—no mud, no dust. Our pace now got faster, but at no time did I attempt to put the car to her full speed. Redhill was soon passed, as was Horley and Chequers. Poundhill was rather loose up the hill, but good at top and onwards. Balcombe was rapidly run through, and Haywards Heath was reached at 12.45. So the 43 miles were done in 3½ hours—about 14 miles an hour. Having arranged for two friends from Brighton to meet me there at 3 p.m., I stabled the car at the Railway Hotel and lunched at same place. The surrounding scenery being most interesting, I took a look at it from the top of the hill. At three o'clock my friends arrived, and at 3.15 we started for Brighton, via Ditchling and Clayton. Although Clayton Hill is stiff my car took it on middle speed, and I did not use my low speed at any time. Brighton (14½ miles) was reached at 4.20. The amount of motor-car car spirit used was three gallons exactly; water lost by evaporation under one quart. This car has a flanged cooler in front and pump, in addition to the old-style condenser, and

practically uses no water, or, I should say, loses no water by steaming. On Sunday we took the inland road to Worthing (12 miles). Nothing of note occurred, but Worthing people seemed much interested, and remarked on the very quiet running, which is mainly due to the two-cylinder system, and doing away with the long exhaust valve levers; barring electric, it is the quietest car I have ever tried, and they are many and the systems various. The time taken running to Worthing was 38 minutes, and 39 minutes return. I housed my car at a friend's stables. In showing the engine works to an enquiring mind on Monday I accidentally smashed the lubricator glass, but Messrs. Monk & Lonsdale, of North Road, repaired same by an ingenious manipulation of a tin cone, and charged quite a nominal sum. On Tuesday, my two friends, son, and self, started back, but *via* Patcham and Handcross. I kept my car at lowest possible speed, with high speed belt on, by shutting down supply of vapour, as I wished to see the country. Up Handcross Hill, Mrs. Knight, who had never steered or handled a car, drove the vehicle unaided, we three males walking to stretch our legs. I left the car running at lowest gear.

After top of hill, my son, twelve years of age, drove her on middle speed six miles. I then took charge to Reigate, where we stopped to refresh, the time being close on one o'clock—we left Brighton at ten. Messrs. Marriage & Co. supplied me with some petrol. We left at 3.30 for Croydon, arriving at 4.20, and dropped my friends, who returned to Brighton by train, they expressing unbounded admiration at the ease and quickness as well as the quietness of running. Just after I left them one of the two brake rods snapped at the thread, so I ran round to a wheelwright, who soon welded a new length of rod and tapped and cut a new thread. We left Croydon at 5.35 and quietly ran over the more or less bad roads to London and on to Willesden Green, arriving home at 6.55. The engine gave no trouble, and I did not touch a screw or alter a belt from start to finish, with the exception of what I have already stated. I enclose a photo of the car."

THE De Dion-Bouton British and Colonial Syndicate, Limited, has been registered, with a capital of £6,000, to acquire the business of dealer in and agent for motor-cars, motor-cycles and the component parts and accessories thereof carried on by H. O. Duncan at 3 Rue Meyerbeer, Paris, and to carry on the business of motor-car, motor-cycle, bicycle, and carriage builders, etc. The first directors (to number not less than three nor more than seven) are: T. H. Weguelin, R. H. Fuller, the Hon. J. Scott Montagu, S. F. Edge, and H. O. Duncan. The Company inform us that they are now in a position to take orders for De Dion, Bouton & Co.'s new 3-h.p. voiturette, and, of course, for tricycles and quadricycles.

## THE AUTOMOBILE CLUB OF GREAT BRITAIN.

THE next election of candidates for membership will take place on the 31st inst. Members who desire to propose friends as members are reminded that the subscription of a member elected after October 1st covers the period ending December 31st in the year following.

Applications for seats at the annual dinner of the Automobile Club, which is to take place at the Hotel Metropole on November 14th, are being daily received. Members are reminded that seats will be allotted in order of priority of application, and that the number of seats is limited. Application with remittance, 10s. 6d. per head, should be made to the Accountant's Department of the Club, Messrs. Andrew W. Barr & Co., 30 Moorgate Street, E.C.

A large number of private motor-carriages owned by members have been entered for the meet and drive to Sheen House Club on November 14th. Members are reminded that in order to gain admission to Sheen House Club on this occasion it will be necessary to have a special ticket, which can be procured from the Secretary of the Automobile Club.

The clubs which are recognised by the Automobile Club de France are the following:—The Automobile Club of Great Britain, and the Automobile Clubs of Belgium, Austria, Switzerland, Turin, Germany and America.

The Committee of the Automobile Club of Great Britain desire to point out that entries of English carriages for the Gordon-Bennett International Automobile Cup can only be made by members of the Automobile Club of Great Britain and through this Committee. An entry for a contest for the Cup must be made prior to January 1st in the year in which it is to be contested. Further particulars may be had on application to the Secretary of the Automobile Club of Great Britain.

A Committee is sitting to decide on a design for a badge for the Club. It is hoped that the badge will be ready before November 14th.

The Racing Rules Committee is in communication with the National Cyclists' Union and the Amateur Athletic Association with reference to the settlement of racing rules. Generally, the opinion of automobilists appears to be that driving an automobile is in many respects akin to steering a yacht, inasmuch as success results from a combination of a good machine and skilful direction, and that there should be no rule to prohibit the racing of an amateur automobilist against a professional automobilist in a race open to both amateur and professional drivers.

Several important matters are under the consideration of the Committee, and it is possible that a meeting of manufacturers to consider proposals may be called early in November.

At the last meeting of the Camberwell Vestry, in connection with a recommendation of the Scavenging Committee that six dust vans be ordered at £55 each, Mr. Somerville asked if the committee had considered the advisability of purchasing motor dust vans, which he believed would enable the work to be done more efficiently and at a much cheaper cost. In reply, Mr. Ayers stated that the Surveyor had the matter under consideration.

At a meeting of the Watch Committee of the Newcastle Corporation on Friday last week, the Chairman (Alderman Sanderson) made a complaint of the speed of motor-cars, particularly in going round the corners of the streets of the city, which, in his opinion, was often extremely dangerous to the public. Instructions were given to the Chief Constable to issue orders to his men to look carefully after such cars, and see that there were no further complaints in this respect.

# The Hugot Motor-Voiturette.

FIG 1.—GENERAL VIEW.

**A**MONG the many new types of light motor-voiturettes lately introduced is the one illustrated herewith, and made by M. Hugot, of 8 Rue Sainte Apoline, Paris. The body of the car is suspended on the steel frame by C springs at the rear and plate springs at the front, which are claimed to reduce the vibration experienced by the riders to a minimum. The vehicle has accommodation for three persons, two facing the direction of progression and one on a seat contrived at the front on the box containing the battery, tools, etc. M. Hugot employs a  $2\frac{1}{4}$ -h.p. De Dion motor of the latest type, the ignition being, of course, electrical and the cooling by means of radial discs around the cylinders. The carburettor is of the Longuemare type. Two speeds are provided, by means of which, assisted by the variation of the sparking device, speeds of from 14 to 28 kilometres per hour on level roads and from 4 to 14 kilometres uphill can, it is claimed, be obtained. The transmission and variable speed

FIG. 2.—VIEW OF HUGOT VARIABLE SPEED GEAR.

gear presents some interesting features. As will be seen from Fig. 2, the motor is located at the back of the car and drives the rear road wheels, represented by *M* and *K*, through the intermediary of the pinion *B* and the differential gear, which is made up of the pinions *C*, *D*, *E*, *F*. At *J* is an ordinary step clutch, by means of which the wheel *K* can be made rigidly connected with the right half of the axle or to run

loose on the same. When the low speed is in gear, which in the Hugot car is the normal position of the transmission device, the wheel *K* is rigidly connected with its part of the axle, and the transmission of the power of the motor is made to the two rear road wheels through the differential gear. Around the differential gear is a gear case which also serves as a drum for the low-speed brake (not shown in Fig. 2). To change over from the low to the high speed the band brake *G* is tightened, the clutch *J* being at the same time thrown out, so causing the wheel *K* to run loose on its axle, the result being that the wheel *M* becomes the only driven one and runs at double the speed of the low gear. To change back again the high-speed band brake *H* is applied. The gear is both simple and ingenious, the only drawback we can notice being that at the high speed only one of the rear wheels is driven. As the high speed in voiturettes is never very excessive it is probable that the drawback alluded to is more imaginary than real. The car weighs rather less than 4 cwt. and can, it is claimed, mount gradients of 1 in 10. The road wheels are of the suspension type, fitted with pneumatic tires; the car is 8 ft. long by 3½ ft. wide. The Hugot car is being introduced into this country under the name of the "Paris" by the United Motor Industries, of 3 Rue Meyerbeer, Paris.

THE Hiram S. Maxim Automobile Syndicate, Limited, has been registered with a capital of £25,000 to adopt an agreement with H. S. Maxim and J. de Meray, and to carry on the business of motor-car, motor-cycle and bicycle manufacturers, engineers, etc.

AT Kenilworth, last week, William Williamson, of Coventry, was summoned for driving a motor-car at Kenilworth without a red light at 7.15 p.m. It appeared that defendant was burning a white light in front of the car, but neglected to have a red one behind, and it was stated it did not seem to be generally understood among drivers of motor-cars a red light behind was necessary. A fine of one guinea, including costs, was imposed.

## MOTOR-CARS ON THE CONTINENT.

(From Our Own Correspondent.)

### Recent Motor-Cycle Races.

SEVERAL provincial towns have recently held motor-cycle races, and it is evident that the popularity of the sport continues to increase. On the 15th instant two races were decided at Saintes and one at Limoges. In the first of the two events at the former town Cibron was the winning chauffeur, and Favier proved victorious in the second. At Limoges, Bertin of Marmande finished first, covering the 9,768 metres in 13 m. 31 s. The day following witnessed a 25 kilometres course on the Marseilles track in which five competitors took part. The placed men were T. Reboul, Bourret, and Cavasse, who finished in the order named. The winner's time was 31 m. 29 $\frac{3}{4}$  s.

### A Novel German Motor - Tricycle.

At the recent motor-car exhibition in Berlin, the Berliner Maschinenfabrik Gesellschaft (Henschell & Co.), of Charlottenburg, showed the novel motor-tricycle illustrated herewith. As regards the motor and transmission the machine resembles an ordinary motor-tricycle, but in place

of the rider being mounted on a saddle he is provided with a comfortable upholstered and spring-suspended seat. The engine is started by means of the pedals in the usual way, but convenient foot rests are provided for use when once the motor is in operation.

### The 100-Kilometre Motor-Cycle Record.

RECENTLY Béconnais has had matters all his own way as far as motor-cycle achievements on the track are concerned, and one has almost acquired a habit of invariably looking to him for new figures. This time, however, it is not he but Gasté who has set up fresh records. During the first half or so of his ride on the afternoon of the 16th inst. at the Parc des Princes, no one thought of records, as the chauffeur was well outside the existing figures. At the sixty-eighth kilometre, however, the slaughter commenced, and from that point to the finish new records were set up. The time for the complete distance of 100 kilometres was only 97 m., or at the rate of nearly 62 kilometres per hour. The new times are:—

|               | H. | M. | S.               |
|---------------|----|----|------------------|
| 68 kilometres | 1  | 5  | 59 $\frac{1}{2}$ |
| 70 "          | 1  | 7  | 51 $\frac{1}{2}$ |
| 80 "          | 1  | 17 | 47 $\frac{1}{2}$ |
| 90 "          | 1  | 27 | 54 $\frac{3}{4}$ |
| 100 "         | 1  | 37 | 24 $\frac{1}{2}$ |

### The Proposed Paris-St. Petersburg Race.

At the last meeting of the Committee of the French Automobile Club Messrs. Thévin and Houry presented the report of their journey made with a view to organizing an automobile race from Paris to St. Petersburg. They concluded that, owing to the primitive state of the roads in many places, such a contest is impossible.

### M. Léon Serpollet.

M. SERPOLLET, the well-known inventor and constructor of automobiles, has quite recovered from his recent severe illness. He signalled the end of his convalescence last week by giving a complimentary dinner at his residence at Villiers-sur-Marne to Dr. A. Lucas, whose medical skill brought him safely through his illness.

### The Renault Motor-Tricycle.

A NEW company has just been formed in Paris (33 Rue de Naples), with a capital of £20,000, to acquire and exploit the patents in the Renault motor and motor-tricycle, described in a recent issue of *The Motor-Car Journal*. The title of the new concern is L'Energie, Société des Moto-Cycles et Automobiles, brevets Renault et autres.

MOTORISTS in Dublin and district may be interested to learn that motor-car spirit is being stocked by Messrs. Beckett, 17 Fleet Street, Dublin.

MESSRS. P. SOUVESTRE AND CO., LIMITED, has been registered with a capital of £5,000, to acquire the business of importers of and dealers in motor-cars hitherto carried on by Pierre Souvestre and Axel C. Steen-Nielsen at Liverpool, to adopt an agreement with the said vendor, and to carry on the business of cycle, carriage and general manufacturers, mechanical engineers, etc.

THE Motor Manufacturing Co., Ltd., ask us to give a denial to the rumours which allege that this Company has been compelled to withdraw its recently-produced new type of light two-seated car from the market owing to irremediable defects. On the contrary this vehicle, already so well known as the "Princess," has carried out very numerous and exhaustive trials in the most satisfactory manner, and the Company inform us that they are daily booking orders from clients who have had long trial runs on the car.

THE officials and staff of the Birmingham Small Arms Co., Ltd., Birmingham, held their annual dinner at the Crown Hotel, Leamington, on Saturday, the 21st inst., when about a hundred persons sat down. A large party of the officials was met at the station with a motor-car and driven to Mr. Charles T. Crowden's motor works, where they inspected in detail the motor-cars of various descriptions there designed and in course of construction, and expressed themselves highly pleased with what they saw.

THE Automobile Co., of America, of New York, have lately completed two new types of vehicles propelled by the "American" petroleum-spirit motor: a stanhope phaeton and a brake. The stanhope is so constructed that if the top is taken off a second seat may be opened up in the rear, thus accommodating five persons. Power is supplied by a 7-h.p. twin-cylinder balanced motor. The weight of the vehicle is 1,400 lb., the extreme mileage on one supply of fuel 150, and the maximum speed 28 miles an hour. The capacity of the water tank is 8 gallons. The touring brake has petrol storage accommodation sufficient for a run of 450 miles. The 8-h.p. motor is vertical and is placed in front of the vehicle, leaving the whole of the "body" free for passengers and luggage. There are three forward and three reverse speeds, and an emergency brake on the rear road-wheels in addition to the ordinary band brake. Solid tires and wooden wheels are preferred for this class of vehicle.

## VOITURETTE FETE AND RACE IN PARIS.

**F**AVOURED with glorious weather, a large attendance of spectators and a numerous and thoroughly representative entry of cars, the fête held on the 18th inst. at the Rond-Point de Longchamp, Paris, under the auspices of *Le Sport Universel Illustré*, could scarcely fail to be a

success, in spite of the lamentable lack of management which characterised the proceedings. Timed to commence at 9.30, the first of the competitors in the opening item on the programme did not get under weigh until 10.15, and punctual arrivals were entertained (?) for three-quarters of an hour by some dozens of workmen engaged in completing final arrangements. And then, too, when a start had been made a number of people were permitted to invade the track, where they impeded the competitors and obstructed the view of the spectators.

Apart from these drawbacks, however, the fête was most enjoyable, the cars being prettily decorated and in most cases managed with much skill. The scene of the contests, the Rond-Point de Longchamp, is an ideal spot for a gymkhana, as it rejoices in a perfectly level surface, so hard and firm that the vehicles were able to take sharp corners at a high rate of speed without danger of skidding to any appreciable extent. The vehicles eligible to participate were all types of two or more seated voituresses, propelled either by steam or petrol, of which the catalogue price did not exceed £240, and no less than fifty-three automobiles were entered as complying with these conditions.

The first item on the programme was termed a "concours de direction," and consisted of demonstrations of the steering capabilities of the vehicles driven either by ladies, or by boys or girls not exceeding seventeen years of age. Numbers of metal figures were dotted about the course, and all of them did not escape scatheless, as on one or two occasions the fair *conductrices*, in their anxiety to achieve some particularly brilliant feat of steering, victimised an inoffensive metallic individual in a manner dreadful to behold. In one instance, indeed, the poor sufferer was only rescued from under the *pneumatiques* of his assailant by the combined efforts of a dozen or so sympathetic people who lifted the car bodily away.

I can, however, testify to the remarkable *sang froid* with which the miserable victims treated the accidents and the conspicuous courage they displayed in bearing their wounds. Not even a cry escaped their lips, and after a little surgical attention with a hammer they resumed their places uncomplainingly! The number of competitors necessitated many heats and a final, and the judges' ultimate placing was as follows:—1st, Stanley, Peugeot; 2nd, Hugot; 3rd, Créanche; 4th, Hugot; 5th, La Parisienne; 6th, Boyer; 7th, Roland; 8th, Dulac.

Undoubtedly, the cars which attracted most attention

were the "Stanley," for they were exquisitely decorated and their lady drivers showed much skill. Light, graceful, and running perfectly silently, these voituresses presented only one drawback, and that was they showed steam continually when in motion, which, however, is a failing not likely to trouble the French automobilist who wishes to drive an effective little car.

On the conclusion of this contest eight prettily decorated "Victoria-Combination" voituresses (see second illustration) went through a series of evolutions in unison, and having evidently carefully rehearsed their display it proved very effective. Following this item there took place a number of the usual gymkhana sports, such as tilting at rings and at wooden tubs filled with confetti, Turks' heads, and battle of confetti, etc. Banners and wreaths having then been distributed to the competitors, many of the company betook themselves to the Restaurant de la Cascade, where an excellent lunch was served, Baron de Zuylen occupying the presidential chair.

The following day saw the race from Suresnes to Rambouillet and return, in which the competing vehicles were divided into the three following categories: (A) Voituresses not exceeding 2 h.p., (B) voituresses not exceeding 3 h.p., (C) voituresses exceeding 3 h.p. The route followed was by way of Versailles, Buc, Toussus, Châteaufort, Saint-Rémy-les-Chevreuse, Cernay-la-Ville, and Villeneuve, both on the outward and the return journey, and comprised a total distance of 104 kilometres. Thirty-five competitors presented themselves at the start, and the very fair proportion of twenty-three successfully accomplished the journey. Only one mishap occurred, and the second of the two Stanley cars was the victim. A too sudden turn by the driver, M. Lamy, at an awkward corner in the village of Saint-Rémy-les-Chevreuse resulted in the overturning of the vehicle, and in consequence abandonment of the race. The positions and times of the leading cars at the finish were as follows:—

**SERIES A.**—1, L. Renault, 2 h. 49 m.; 2, M. Renault, 3 h. 32 m.; 3, Parisienne, 3 h. 50 m.; 4, Parisienne, 4 h. 16 m.; 5, Parisienne, 4 h. 21 m.; 6, Hugot, 4 h. 43 m.; 7, Gallet and Itasse, 4 h. 53 m.

**SERIES B.**—1, Peugeot, 2 h. 38 m.; 2, G. Richard, 3 h. 5 m. 30 s.; 3, Parisienne, 3 h. 51 m. 30 s.; 4, Peugeot, 4 h. 2 m.; 5, Parisienne, 4 h. 5 m.; 6, Noé Boyer, 4 h. 5 m. 30 s.; 7, Filtz, 4 h. 49 m.; 8, Klaus, 5 h. 11 m.; 9, Wehrle, 5 h. 22 m.

**SERIES C.**—1, Hurtu, 3 h. 11 m.; 2, Stanley, 4 h. 2 m.; 3, Delahaye, 4 h. 7 m.; 4, Lemoine, 4 h. 12 m.; 5, Roland, 5 h. 22 m.; 6, Dulac, 5 h. 24 m.; 7, Delahaye, 6 h. 9 m.

It will be noted that the fastest time was made by the Peugeot voituress, which accomplished the journey in eleven minutes less than the Renault car. The latter, however, followed up its noteworthy victories in the Paris-Trouville and Paris-Ostend courses by again beating all competitors in the same category, and has undoubtedly proved itself to be one of the most reliable and effective small cars now in the market.

ERNEST M. C. INSTONE.

## CORRESPONDENCE.

## THE MOTOR-CAR CLUB.

TO THE EDITOR OF *The Motor-Car Journal*.

SIR,—I have read with much surprise the extremely curious letter of Mr. R. E. Crompton, which seems to have been penned with the idea of attacking the Motor-Car Club, of which I have the honour to be the honorary secretary, and at the same time to injuring the sporting run to Brighton which my Club is arranging on November 13th next. If Mr. Crompton has been such a regular reader of motor-car papers, and interested in the progress of automobiles over such a number of years, how is it that he has waited until this year to attack the policy of my Club in holding an annual run? We have done this ever since automobiles have been allowed to run upon the roads in England, and each year, as everybody well knows, with greater success than in the previous year.

The memorable meet in 1896, when the British public saw motor-cars on the road for the first time, was inaugurated by the Motor-Car Club, and its position as the pioneer of the movement in England is unquestioned.

Surely Mr. Crompton's remarks are not due to the run of last year being of such a short character—namely, to Sheen House—as I notice the exact programme which we carried out in 1898 is being copied by the Automobile Club this year. Evidently our lead is good enough for the Club which Mr. Crompton mentions to follow, and, although we may have sinned in Mr. Crompton's eyes in this respect, it is evident that our programme was good enough for others to follow. Probably they will next year appreciate the reasons leading us to arrange for a run to Brighton this year, and will again copy us. However, this is by the way, and I will now endeavour to answer the queries of Mr. Crompton, which perhaps are not in the best of taste for a gentleman who claims to have been interested in automobiles for the last thirty years but whose interest seemingly does not get beyond riding long crank bicycles in company with automobiles.

I would venture to suggest that Mr. Crompton should become a practical motorist of the present day, and not merely one of thirty years ago, as then probably we should have the pleasure of hearing various interesting points from him in regard to motors in much the same manner as the cycling world is favoured with his views on long cranks.

He asks, "Is the Motor-Car Club a bona fide club, and not a trading association?" I can certainly say that it is absolutely a bona fide club and that no trading of any sort, shape, or description enters its doors. The Club is not even a proprietary club; it is governed by a committee composed of its own members. It is a Club entirely devoted to the best interests of the sport, and favours no particular motor, person, or company. The best proof of this is that the Club's invitations to the run are issued to the owners of every kind of motor-vehicle. Not only are they invited to the run, but they are also invited to be my Club's guests at the banquet to be held at the Hotel Metropole, Brighton. The members of my Club have supported, and always will support, any event or movement for the general benefit and welfare of the sport and industry. As a proof of this I would refer to the support accorded by the Motor-Car Club to the competitions held in connection with the Exhibitions at the Agricultural Hall and at Richmond. It is also interesting to note that in the 100 miles road tests promoted by the *Daily Mail*, and carried out under the auspices of the Automobile Club, nearly all the participants up to the present have been members of the Motor-Car Club. Motor-cycling as a sport has also been introduced to the public this year solely through the instrumentality and under the rules of the Motor-Car Club.

In regard to Mr. Crompton's request "to give us" (who he means by "us" I cannot quite follow) "the names of the members" of my Committee, there is no difficulty. But I fail

to see what that has to do with our run to Brighton, and I also fail to see why any gentleman who is invited to the run (which, by the way, I would point out to Mr. Crompton is for the owners of motor-vehicles only), or intends to attend the run, should necessarily have the right to inspect the list of members. If, however, it is customary for the motor clubs of this country to give a list of members to any one who applies for the same, or allow the list of their members to be inspected by the public, and Mr. Crompton will give some definite proof that this is the case, my Club will do likewise.

Mr. Crompton then asks me "to give assurances that the Club is supported by the members' subscriptions." Whilst the Club, as a club, is supported by the members' subscriptions it is obvious that race meetings, runs, exhibitions, and big undertakings of that sort must be supported by various individuals guaranteeing the liabilities incurred, as if the Club is promoted for sport it is hardly likely that the subscriptions would cover expenditure of this character. I know that at the recent show at Richmond by the Automobile Club (of which I believe Mr. Crompton is a member) it was not held by them at all except in name, individuals and exhibitors in particular guaranteeing the Club against all financial loss; and naturally for undertakings which might run the Club into financial loss the same sort of arrangement is in vogue in the Motor-Car Club.

In regard to his final suggestion, that if ladies and gentlemen join this run they may advertise a trading association, my answers on this point will clearly show Mr. Crompton that his surmises are incorrect; and as the run is open to every kind of motor-car which runs upon the road, it is natural to presume that anybody, if he chooses, can get as large an advertisement as he likes out of it. But how this would benefit the Motor-Car Club, even if it were a trading association, I utterly fail to see. Perhaps Mr. Crompton would be doing good to somebody by suggesting how my Club would benefit!

Mr. Crompton's penchant for letter writing is notorious, but I cannot help feeling that this attack does not come from the heart of such an amiable gentleman. I fear that he is merely being made a cat's-paw of by others, and, therefore, I have no personal feeling so far as he is concerned.

I have answered Mr. Crompton's letter somewhat more fully than I had intended, but I am far too busy to enter into a long correspondence with him, and I also have no wish for my Club's meet on November 13th to be prejudiced in any way solely for the purpose of gratifying the possible animus of Mr. Crompton and his friends.

49, Holborn Viaduct, Yours truly,  
London, E.C., FREDK. W. BAILY,  
October 24th, 1899. Hon. Sec. Motor-Car Club.

TO THE EDITOR OF *The Motor-Car Journal*.

SIR,—I read with a certain amount of amazement and a certain degree of disgust Mr. R. E. Crompton's letter in your last issue re "Motor-Car Club." To me, not being a member of either that or the Automobile Club, it seems to have been written with an ulterior motive, and, in fact, does not strike me as emanating from Mr. Crompton himself, but rather that he has written it at some other person's or persons' instigation.

He asks the Secretary to enlighten "us." Who does he mean by "us"? He commences his letter as if for his own satisfaction, but concludes by asking for information for the general community.

As most cyclists know, Mr. Crompton's hobby at the present time is cycles fitted with long cranks, and I am not aware that he owns a motor-car.

Now, I have taken an interest in automobilism since motor-cars were first allowed upon the roads of England, and I remember that the first run was organized by the Motor-Car Club. From enquiries I have made in regard to the Motor-Car Club I find that it is not a trade club, but is an ordinary club as far as clubs go, and is managed by a full committee

duly elected by ballot, and is not in any way a proprietary club; neither do I think, from what I know of it, that Mr. Crompton, should he be honoured with an invitation to participate in the Club's run on November 13th, will be pestered all the way down with catalogues and price lists.

Trusting you will find room for this from a contributor not in the trade nor, as I say above, in either club,  
36 Greenwood Road, I am, yours faithfully,  
Hackney, N.E., H. G. THOMAS.  
October 23rd, 1899.

## AN IMPROVED STEERING GEAR FOR MOTOR-VEHICLES.

TO THE EDITOR OF *The Motor-Car Journal*.

SIR,—I notice that in your valuable journal of 6th inst. you illustrate an improved steering gear for motor-cars devised by Mr. George Iden, of the Motor Manufacturing Co., Coventry. Now this steering gear appears to me to be identically the same as that used by Panhard and Levassor of Paris for some years past, the only difference being that the joints *B B* are made to hook into the eyes instead of having a fork and pin. It is obvious that when travelling on the road, owing to the sudden-

crank axle (which is all alive with the motion of the car) the joints *B B* will bind and suffer greatly. Joints of the pattern *C C* were used by the Panhard and English Daimler people before, and got very loose and rickety in a short space of time. I am glad to see that the cast iron bracket introduced by the English Daimler Co., and weighing from 18 to 20 lb. has been discarded in favour of a wrought iron bracket such as Panhard always used. I should say that this new steering gear, as illustrated by you, suffers from every defect that the original Panhard was subject to, and is not a patch on the steering joint devised by Charles T. Crowden and illustrated in *Industries and Iron* in the issue of September 1st last. I am sure that a short trial of the two systems would speedily convince the most lay mind as to which is the best gear for wear and work. Each joint in Charles E. Crowden's steering gear is universal and those in Mr. Iden's are not.

Yours faithfully,  
"VERITAS."

October 21st, 1899.

## IMPROVEMENTS IN DAIMLER CARS.

TO THE EDITOR OF *The Motor-Car Journal*.

SIR,—We notice in your issue of Friday last a letter from Mr. Estcourt, stating that he has fitted a cooler to his Daimler car, which gives excellent results.

He has, however, omitted to state that this cooler is made up of our patent cooling and radiating tubes, and was supplied by ourselves.

We send under separate cover a sample of our covered tube for your inspection.

After a series of careful comparative tests, we find that our coolers are from 10 to 20 per cent. more efficient, size for size, than those commonly used, while they are only half the weight.

This is a matter for consideration among car manufacturers using coolers.

Yours faithfully,  
THE CLARKSON & CAPEL STEAM  
CAR SYNDICATE, LTD.  
Deverell Street, S.E.,  
October 23rd, 1899.

## THE CINEMATOGRAPH ON TOUR WITH A MOTOR-CAR.

TO THE EDITOR OF *The Motor-Car Journal*.

SIR,—When I wrote you from Cotherstone last week we were then reduced to running on the 3 and 6-mile speeds, and the day after, on the run to Gainford, the 6-mile speed wheel also gave way and we thus were compelled to run into the latter place on the low speed. As soon as we were unloaded Mr. Sinclair set to work and examined the gear, with the result that I at once wired the Daimler Company to send me a new driving sleeve to fit on the square shaft, and also a new high speed ring. These we could not get until we reached Richmond, Yorks, so the journey from Gainford to Gilling and thence to Richmond had to be done at the only speed we had available, viz., three miles an hour. It was slow work, but as the distances were short and we had plenty of time it made scarcely any difference to us, barring the fact that we felt we were not making so much impression on the people witnessing our arrival. On Saturday the new sleeve and ring duly arrived and was quickly put in position, and on Monday afternoon we had the car out for a trial trip. It seemed just like riding in a new car;

and now that everything is once more in good working order, and the weather at present in this part of the country simply delightful, we are anticipating a few weeks splendid running yet before we turn our faces towards the Border with the intention of spending the winter season in Edinburgh.

I am, Sir, yours, etc.,  
T. J. WEST,  
Barnham, Barnard Castle, Manager of the Modern Marvel  
October 25th, 1899. Co. (Ltd.), of Edinburgh.

ONE of our foreign readers, Señor Alfredo Fontes Magalhaes, 6 R. das Princezas, Bahia, Brazil, writes that he would be glad if builders of motor-cars and cycles in this country would send him copies of their catalogues.

"MOTOR-CYCLE blown to atoms" was the title which one London morning paper gave to an account of an accident to a motor-tricycle near Cheltenham on Sunday. The following is from the *Times*:—"A local electrician was riding along a country road when he noticed that burning benzolene was dropping from the machine and had ignited his stockings. When he dismounted to extinguish the flames an explosion occurred, and the motor-car was blown to pieces. The burning oil reached the supply tank, and the flames spread so far that the grass along the roadside was set alight, and, in turn, ignited a dry hedgerow. The rider fortunately escaped with but little injury. The accident is attributed to the probable choking of the valve by grit, this causing a leakage of the oil."

## SCOTTISH NOTES.

**Motor-Cars at Bazaars.**

THE subject of motor-cars at bazaars was touched upon last week, and it was mentioned that at the big bazaar in Motherwell the automobile proved very useful in helping to "rake in the dollars." A friend of mine tells me he saw one at a bazaar in Carlisle recently, evidently bent on the same work. The car, which had been driven from Hamilton, was plying for hire at so much per head, and judging from the manner in which it was besieged on each return journey my friend thinks it must have proved a "paying spec." In towns and villages where horseless carriages are seldom seen there is something fascinating to the uninitiated in the apparently wonderful gyrations of a well-handled car, and the advent of an automobile is always a signal for crowds of interested spectators gathering to view the modern marvel.

**An Experience.**

I REMEMBER on the occasion of my first visit to Carlisle on a motor-car, with two others, we were stared at and followed as though we had escaped from a lunatic asylum. When we got down at the post office to send off telegrams the crowd had collected round our car to such an extent that when we came out we had literally to elbow our way and do a good bit of forcible jostling before we got "aboard" again. When we started crowds ran alongside and in front, so that our progress had naturally to be slow. While having a much needed "refresher" after our go-mile spin, the court-yard where the car stood was besieged by crowds who had evidently never seen a motor-car in their life. The interest it excited was really extraordinary, one old gentleman in particular anxiously enquiring if we could delay our departure for half an hour till he ran home to fetch his wife and daughter to see the car. This was two years ago exactly, and a great many cars touring between England and Scotland pass through the border towns nowadays. Still, there are a great many towns and villages scattered over the length and breadth of the land where automobiles have never penetrated, and if chauffeurs are anxious to attract attention and be the heroes of a species of triumphal march, let them invade such a spot with their horseless carriages, and they will evoke as much interest as a circus or menagerie. Personally I am a bashful man, but some people like this sort of notoriety, and if they wish to indulge in their penchant let them take the hint given above.

**Exhibitions.**

THE cycle shows in London will soon be on, and motors of all classes will probably be well represented. From all I can learn, however, I do not think there are likely to be many Scottish exhibits. The Glasgow Motor and Cycle Exhibition comes off in January and the Edinburgh one in February, and they will doubtless receive more attention from the somewhat limited Scottish motor-car manufacturers and builders. I understand that the Hamilton Co. are likely to be showing something entirely new at both these exhibitions, but I may possibly have more definite information to give when the date of exhibition approaches a little closer. Last year both shows, while largely taken up with cycles and all pertaining thereto, had a fairly good display of motor-cars, and enquiries from prospective purchasers of automobiles were numerous, showing that the wish to become the owner of a horseless carriage is simmering in more brains than many anti-motorists imagine. I shall be greatly surprised if the year 1900 does not see a very great advance in regard to the attitude of the public towards motor-vehicles.

**Motor-Cars in Edinburgh.**

I LEARN from a trustworthy source that the Edinburgh Autocar Co., who have been forging ahead so vigorously in regard to horseless carriage traffic in the East of Scotland, and whose energetic young managing director, Mr. Outhwaite, recently placed an order with the Daimler Motor Co. for additional cars, are not to have matters all their own way. It is said that opposition is the life of trade, and while the opposition the Edinburgh Autocar Co. will meet to begin with will not be of a formidable nature, still, lots of successful undertakings have had small beginnings, as witness the Edinburgh Company themselves. There is room for more than one running company in "Scotia's darling seat" if the public continue to patronise the cars in the future as they are at present doing. The movement has decidedly "caught on" in Edinburgh, and it is not too much to say that this is largely if not wholly due to the wonderful immunity from accidents which by good management and otherwise the Autocar Co. have enjoyed.

**Automobiles at Dundee.**

THE Dundee Tramway Co., who have a small fleet of motor-cars, have done very well this summer. The cars have been largely taken advantage of by numerous people for touring purposes, and in the course of their peregrinations the machines have travelled very far afield. Those who hire a car for a holiday tour (if they do not possess one of their own) know what real enjoyment means. Of course, I am taking it for granted that the car runs as it should run, that the weather is fine, that the company is congenial, and that the route chosen is a good one. Given these essentials, the man who does not enjoy himself must have a diseased liver, for nothing can be compared to the physical and mental pleasure to be derived from whirling gaily along a good surfaced road in a smoothly running car, in fine weather. I have enjoyed a drive behind a fast trotting cob; experienced the delight of plunging through the foam in a swift sailing yacht; pedalled gaily along on a bicycle; trotted till sore on an ambling nag—but for pure enjoyment give me the delights of a sweetly running automobile travelling at top speed over a gently undulating road and with a crowd of congenial friends.

**The Proposed Scottish Club.**

A MEETING was held on Wednesday last in the chambers of Messrs. Mitchell & Smith, C.A., 59 St. Vincent Street, Glasgow, in connection with the proposal to form a Scottish Automobile Club, or at any rate a branch of the Automobile Club of Great Britain. It was, I understand, decided that a meeting should be organized and held in Edinburgh about the end of November, at which Mr. Johnston, Secretary of the Automobile Club, London, should be asked to attend and submit to those present some of the advantages, etc., to be derived from the great Club. I trust all my Scottish readers will make a note of this, and if they wish to be advised in plenty of time of the exact date and place of meeting as soon as the arrangements are complete, they should send a post card with their names and addresses to Messrs. Mitchell & Smith, 59 St. Vincent Street, Glasgow.

"BROWN HEATHER."

THE Woodhead Manufacturing Co., of Sandiacre, Notts, makers of cycle fittings, are, it is reported, about to embark in the motor-vehicle industry.

MR. A. A. L. HICKMAN, 17 Robertson Terrace, Hastings, sends us a leaflet he has issued on "Motor-Cars v. Horses," from which we learn that a new book, "Round the World on a Motor-Car," is in preparation.

## A LONG RUN..ON A MOTOR-QUADRICYCLE.

MR. HERBERT J. CROFT, of Wildman Street, Kendal, has sent us an interesting account of his ride on a motor-quadricycle from Redditch to Kendal.

Mr. Croft purchased the machine from the Eadie Manufacturing Company, Redditch, and with a view to thoroughly testing its capabilities and powers decided to ride it

through to Kendal, notwithstanding the fact that its construction was practically new to him and that the only instruction he had received in regard to the working of the vehicle had been imparted in the previous two days.

Redditch was left at a quarter to six o'clock on the morning of Friday, the 6th inst. A thick mist lay all around. Nevertheless, the 14 miles between Redditch and Birmingham were covered in 55 minutes. Lichfield was the next point on the route. The mist still prevailed, and "the going" was by no means easy. Still, the machine performed its part well, and the rider had no difficulty in manipulating it to his own satisfaction. At Lichfield, which place he reached at 7.50, a stay of 20 minutes was made for breakfast, following which headway was made through Staffordshire to Stone, 90 minutes being required to cover the 22 miles between Lichfield and Stone. The fog was extremely thick in the Trent valley, but the vehicle still made steady progress past Newcastle-under-Lyme, Sandbach and Middlewich, and thence to Northwich. The distance between Stone and Northwich is 34 miles, and an average speed of about 16 miles an hour was maintained. Next Warrington and Wigan were touched, a short stop being made at Wigan in search of motor-car spirit. The rider then pushed on for Preston, and that town was reached at three o'clock. Thus in nine hours, inclusive of stoppages, a distance of 126 miles had been traversed, without the slightest breakdown. From Preston—which was left at six o'clock—to Kendal the vehicle carried Mr. Croft and a friend, and, being better balanced, ran even more sweetly and comfortably. The road between Preston and Lancaster is an exceeding good one and very suitable for the trial of a vehicle of this character, but unfortunately there was considerable vehicular traffic on the road, and it was necessary on many occasions to ease the motor whilst horses were being passed, so as to avoid the possibility of an accident. But as a rule the horses were tractable and quiet. Lancaster was reached after a most interesting and enjoyable ride between the two places. Lamps had to be lighted at Lancaster, which was left shortly after eight o'clock, and the night being very dark greater care had to be exercised than in the daylight. Still, a fairly good speed was maintained, which led almost to the decimation of a flock of sheep at Beetham, the leaders just being seen in the nick of time. The driver of the sheep was not in sight, nor was there any attempt to make way for the quadricycle, though the horn was being sounded repeatedly. Fortunately no one was the worse for the little incident, the only one of an unusual character throughout the journey. Between here and Kendal the speed was still further reduced, and home was reached at ten o'clock. The distance between Redditch and Kendal is 171 miles, and the average speed of the quadricycle was a trifle over 15 miles an hour. It was surprising, states Mr. Croft, with what ease the motor negotiated nearly all the hills, except the very steepest. There was no doubt as to the satisfactory nature of the trial, and the ride was greatly enjoyed.

It is reported that the New York Central Railway intends to establish an electric cab service in New York and in other large cities along the line.

## MIDLAND MOTOR NOTES.

By "HERCULES."

### The Beeston Motor-Tricycle.

THE Beeston Motor Co., Coventry, scored a success in connection with the one hundred miles road trial on Thursday, October 19th, when their tricycle went the full journey without the slightest mishap of any description.

Only one stop was made, and this occurred under circumstances to which I shall refer later. A careful examination of the tricycle on its return to the works showed that not a bolt or nut required attention. Furthermore, the special cooling apparatus with which the machine was fitted answered its purpose perfectly. At the end of the trial, though over one hundred miles had been covered, the apparatus could be touched by the naked hand without injury. The quantity of petrol consumed throughout the journey was only two gallons. The machine, which was ridden by Mr. Edward Gorton, jnr., was one of their standard patterns, fitted with a 2½-h.p. motor. Mr. Gorton tells me that the start was made in a dense fog, and the party did not emerge from this until nine miles of road had been covered. I expect that some other scribe will deal with the trial in detail, and therefore will only state that any one who knows the road selected for the trial—London to Oxford—will readily agree that it was no "soft thing" for the motors. The stretch of road embraces a large number of hills, some of them very difficult to negotiate, and the fact that the trial proved so satisfactory to the motorists taking part in it should go a long way in removing any doubts which have up to the present existed in the minds of those who have looked upon motors with a longing eye, but have not been quite certain that their possession would not mean constant breakdowns and trouble.

### Strange Proceedings at High Wycombe.

As motorists and cyclists know, nearly half-way between London and Oxford is the town of High Wycombe, which is well known as the metropolis of the chair trade. The main road divides the town for a distance of nearly two miles, and the motorists engaged in the trial on Thursday last week are indignant at the treatment they received at the hands of the Borough Police. The following appeared in one of the Wycombe newspapers on Friday:—

I hear that the Wycombe Borough Police took steps yesterday to test the question of the speed motor-cars may attain in the streets of the town. A number of vehicles went through in the morning, in connection with a London club run, and some of them refused to stop when challenged. On the return journey they found that effectual measures had been taken. In certain cases travellers were warned by a constable with a red flag that a temporary barrier existed further on (in the shape of a scaffold pole held across the roadway), and perforce had to stay their progress. Some names and addresses were taken, and something more will probably be heard of the incident.

The incident alluded to is looked upon by several of the motorists in a different light to that of the writer of the above. They regard the tactics pursued by the representatives of the law as deserving of the severest censure. One even goes the length of describing it as a "dastardly attempt" to wreck the motor-tricycles and endanger the lives of the riders. Superintendent Sparling and his men may consider they have a grievance against the motorists for proceeding at a greater speed than they deem to be wise or safe, but to resort to obstructing the highway with a scaffold pole is hardly a method that does the force credit. It is a pity that a snapshot was not taken of the worthy policeman rushing into the street with the scaffold pole, and that the same could not have adorned the pages of this journal or even the local newspapers. I am informed that the first motorist narrowly escaped an accident through the conduct of the police. He was within twenty yards of the pole when he became aware of its presence in the roadway, and had it not been for the fact that he was not riding at more than eight miles an hour, he would most likely have come to grief. The only warning

which the motorists had was the presence of a man with a red flag near to the obstruction.

#### Motor-Vehicles for Municipal Purposes.

DURING a discussion on the Coventry new rates a question of interest to motor manufacturers cropped up at the City Council meeting. The cost involved by the keeping of a large number of horses and of horse hire forms a considerable item in the Council's yearly expenditure, and on Tuesday the Finance Committee found themselves in the position of "asking for more" to the tune of another £250. One councillor argued that the expenditure for horses, etc., was too much, and that if the Council provided their own horses £1,000 per year could be saved. The chairman of the committee denied that this could be done, and it is a matter for argument whether such an amount could be saved whilst so many horses are engaged. But Councillor S. Gorton, the managing director of the Beeston Motor Co., Ltd., intimated that the Council would shortly be able to provide themselves with motor-wagons, which would enable them to dispense with horse hire. There cannot be the slightest doubt that an enormous saving would be effected by introducing motor-wagons for scavenging and work of a similar character, and the Corporation of Coventry should certainly not be behind other towns in employing motor-vehicles.

#### The Lanchester Motor-Car.

MESSRS. C. VERNON PUGH, managing director of Rudge-Whitworth, Ltd., and his brother, John Pugh, have for some time past been interested in the Lanchester motor-car, and are about to form a company for the purpose of developing the Lanchester patents. It is generally understood that the Lanchester motor-car is an exceedingly good one, and merits a front rank position. The inventor has been experimenting with the motor for at least four years, with very satisfactory results.

#### More Motor-Car Firms in Wolverhampton.

MR. E. H. W. TRUSSELLE, of Byrne Road, Wolverhampton, having met with considerable success in the sale of motor-tricycles, now contemplates building his own in future, and is erecting a workshop for the purpose, and also for the building of bodies for motor-cars.

#### A Good Run by a Star Car.

THE Star Motor Co. evidently do not believe in doing things by halves. They certainly put their motor-vehicles to some severe tests before sending them out of their works. On Monday last Mr. Lisle, accompanied by his son, gave one of his new cars a trial trip to Newbury in Gloucestershire, a distance of 127 miles. I started them off at 10.45 a.m., and from wires they sent me from Kidderminster at 11.35, Worcester at 12.45, Tewkesbury at 2.13, and on arrival at Gloucester at 3.10, it will be seen that they did the journey to that city (70 miles from Wolverhampton) in the remarkably good time of 4 hours 25 minutes, including stoppages. The worst part of their journey, however, lay before them. To reach Cirencester, a matter of 15 miles further on, they had to climb the famous Birdlip Hill, two miles in length. This was accomplished in very good time, taking the state of the roads into consideration. They eventually arrived at Newbury, *via* Swindon, at 10.30 p.m., after climbing a few more difficult hills, thus doing the whole distance (127 miles in all) in twelve hours, less three hours for stoppages. I understand that the car travelled grandly throughout the whole journey. They left Newbury to return at 12.50 on Tuesday morning, but were obliged to give up at Swindon at 4 a.m., owing to a dense fog. They left Swindon, however, at 10.15 and Cirencester at 1.25, and as they were then on pleasure bent they travelled *via* Cheltenham. When I last heard from them they were expecting to arrive at Wolverhampton again at about 6.30.

## WOMEN AND AUTOMOBILISM.\*

By MISS N. G. BACON.

It is incumbent upon the intelligent woman to be interested in life, all its phases and developments. Automobiles and automobilism are not only fascinating subjects for study from the point of view of pleasure, but they offer a marvellous opportunity for the practical utilization of any mechanical talent or ingenuity. Thoughtful women have come to the front during the past few years to study all branches of life's work, and to endeavour so far as possible to educate themselves to fill positions of responsibility and trust. Indeed, the march of advancing womanhood towards all points of central energy is one of the most interesting features of this century. Doors that have been closed since the world has been, are to-day open. Professions that were in the years of

our foremothers considered above or beneath the capacity of a woman are now recognised as compatible with a woman's dignity and power.

But in speaking of automobilism we enter the arena of outdoor pastimes and occupations. All of us here can remember the advent of the bicycle, and its reception by that estimable old gentleman, Mr Grundy.

The old fogeys of Rome could not have been more shocked at Virginia's appearance in the Coliseum than were our "fine old English gentlemen" at the sight of their womankind—self-propelled. This horror, as you will all remember, was real, and it resulted in so strong an opposition to bicycling, that it was by no means an uncommon thing for a girl not to dare to ride near her own house lest the vials of paternal wrath should be poured on her devoted head. But we fought against masculine prejudices and the allied nuisances. Having cycled for some seventeen years I could speak at length upon this subject if time permitted, but suffice it to say that women owe to the cycle a freedom and a power never before enjoyed.

The pastime of cycling is all very well, but the motor vehicle gives a foretaste of something better to come. Automobilism offers an advance in the future as inconceivable to the novice of to-day as cycling afforded the uninitiated wheeler of the past. The question naturally presents itself to the mind, what will the automobile do for England's womanhood? This is a large question, and cannot be answered in an off-hand or slipshod manner. In any reply that can be made, automobilism must first be divided into departments of pleasure and profit. The automobile is, and may only be, the rich woman's toy; *i.e.*, it may be useful from the point of view of pleasure only, but it can also be considered the professional woman's friend, if viewed from its profit-earning side. As wealth holds a prominent place in this world, it seems desirable to deal first with motoring as a pastime. The efficiency of the motor vehicles of to-day leaves much to be desired, for it offers little scope, if any, for the lady motorist who seeks enjoyment of an unique kind. Driving a car in company with a mechanic seated in close proximity to oneself is scarcely agreeable, nor is it yet found to be satisfactory to have the man, no matter where he may be seated, in livery, to act as mechanic at one moment and as footman the next, for the motor-vehicle, by its construction and its peculiar mechanism, requires occasionally special care and attention *en route*, which only a skilled engineer can give. Hence, it is most desirable that women should study the design of horseless vehicles, for comfort is a very essential item and one that should not be despised. I have seen a considerable number of vehicles, but not one as yet that appears to be likely to yield much comfort and ease for long and short distances.

A car that is liable to continuous breakdown is unsuited to the requirements of the lady motorist. A really efficient automobile, one that performs all that its manufacturer claims, although it may be full of limitations and shortcomings as to speed, vibration, noise, smell, etc., is a more desirable vehicle than one that falls lamentably short of the manufacturer's guarantee.

After design and efficiency come mechanism and propulsive power. Learning to drive a car is a comparatively simple matter, but to understand its working parts sufficiently to have them in full control, and in case of disaster or breakdown, to regulate its apparently incomprehensible ways, and to restore, without loss of temper or patience, its running powers to a normal condition, require trained skill. There is at the present moment no place where women can be educated to handle tools, or to adjust the machinery of the car they wish to drive. A superficial knowledge may be given by enterprising manufacturers to purchasers of cars that will enable them to drive, and even to understand the general working of the machinery, but more than this is required before lady motorists can be responsible for the manipulation of their cars. It is difficult indeed for experts to detect errors of adjustment, and the cause of the imperfect working of the machinery, therefore it is imperative that those women who seek to become practical motorists should devote time and skill to the study of the mechanism of automobiles at least sufficiently to enable them to detect what is wrong in case of breakdown, and how to remedy same. It is admitted, I think, that more time is generally spent

\* Paper read at Lady Harberton's house on the 20th inst.

in discovering the cause of a breakdown than in removing it, for the services of a skilled mechanic can be brought into requisition directly knowledge is obtained as to the nature of the breakdown.

The propulsive energy I refer to last, although it should perhaps come first, for neither the design nor the efficiency of automobiles can be considered until it has been decided definitely whether steam, electric or petrol cars are favoured. I cannot here attempt to go into details concerning the driving power of vehicles, for the subject is a deep one, and requires the most careful study.

Granted, then, that women should study the automobile before attempting to enjoy motoring, I pass next to the nature of the pastime. Those who have enjoyed the fascination and the exhilaration of driving through the air, along our public highways, with little or no muscular effort, up hills and down dales, at a high rate of speed, can speak with eloquence in praise of its enjoyment; but even the most eloquent generally finish their eulogistic remarks by saying that no words can adequately describe the sensation. To really appreciate what motoring is, you must be a motorist. There are no half measures. It is "To be, or not to be." There are, of course, various phases of enjoyment. The most ecstatic I should imagine to be that of whizzing through the air at a breakneck pace, regardless of all else but speed. But, it is whispered, with hand uplifted, that cannot be. By the laws of the land any speed exceeding twelve miles an hour is prohibited. The uninitiated say, "Surely that is enough"; but those who have tasted the delights of motoring, solemnly, and somewhat regretfully, shake their heads, and protest, in as mild language as is possible for their feelings, against unnecessary restrictions. Apart from the speed craze, the pleasure of pottering along sweet lanes, surrounded by landscape beauty, must not be despised. It is impossible to touch even the fringe of the subject here, and, therefore, I leave it alone, and simply appeal to the imagination of my hearers in the hope that they may catch the tiniest glimpse of forthcoming pleasures. For my own part my appetite for motoring has only been sharpened by what little experience I have enjoyed of motor-vehicles. A few years hence I may speak with more knowledge, perhaps with even greater enthusiasm, and, at any rate, I hope with less opposition, for to me it seems strange that anyone should consider it unprofitable for women to study the automobile and automobilism.

I come now to the professional women. Many of us are deeply interested in all agricultural and horticultural pursuits. Various colleges exist for the instruction of women in the arts connected with the cultivation of the land and its produce. Gardening, fruit growing, bee-keeping, dairy produce, and poultry-keeping, are occupations now considered to be adaptable to women's labour, and I think statistics will prove that motor-vehicles are less costly for haulage of heavy traffic. The question of transit of the produce of the land from the door of the producer to the markets is one of special interest to women, for until the nationalisation of our railways is arranged, the problems in connection with rural life are very perplexing.

Sceptics may smile, and render the world unpicturesque by means of their unseemly jokes, jests, and caricatures of women driving such vehicles. Women should study the whole question dispassionately and with intelligence in order to test for themselves whether the motor-vehicle will or will not be useful to them in their various agricultural and horticultural callings, for those who laugh last generally laugh best.

I think I have now covered the whole ground of my campaign. Those of us who seek to form a Ladies' Automobile have very unpretentious claims. Indeed, we are modest, for our knowledge is so meagre that all we seek is an opportunity for studying the whole matter, and to do this some centre should be formed around which women interested can gather. The Automobile Club of Great Britain claims the distinction of being "a centre of information and advice on matters pertaining to motor-vehicles, for those who are not owners as well as for owners of motor-vehicles, and yet it closes its doors to more than half the adult human race. Professor Vernon Boys wrote to me and said: "In our membership one touch of motor makes the whole world kind," but I fail to appreciate the logic of such a remark, for how can "the whole world be kind" when, out of a population of some forty millions of people only 500 odd men are members of this Club?

Who could deny even 1,000 men the privilege of having a social club for any purpose whatsoever? But they cannot logically expect to form the centre of information and advice if they exclude women from their membership. One consolation, indeed, women are offered by the administration of the Automobile Club. That is, they are classified with minors—not infants—therefore a woman now can surely claim equality with youths who have lived twenty years and eleven months, and even a score more days.

Women may be very weak and silly creatures, but they represent at least half, if not more, of the human race. True, the gentlemen members are most kind and considerate in taking women for drives like children in their motor vehicles, but it is an odd mixture indeed to have, on the one hand, a club which has been founded to be a centre of information, and, on the other, a rigid rule for the exclusion of adults in consequence of the sex disability. To make the situation perfectly logical, the trade should refuse to sell vehicles to "ladies and minors," as being only fit for the use of gentlemen. Yet I have read, continually, advertisements—indeed, it was just such a press notice that led me first to the study of motor-vehicles—declaring that certain cars are so simple that any lady can drive them. When first the suggestion of the formation of a Ladies' Automobile Club was mooted, women were accused of desiring to intrude upon the privacy of men enjoying the comforts of their own club, but seeing that this was false, and that we only desired to form a very unpre-

tentious centre for the study of motor-vehicles, it has been asserted that not enough women interested in automobilism exists. I put the challenge to-night! Are we, or are we not interested?

If we are, let us start a centre, and study all that pertains to automobiles and automobilism and see where we stand. There is so much foundation work to be done preparatory to women becoming practical motorists, that the sooner a start is made the better it will be for all concerned, for this is a question that affects the interests of the entire human race.

## REFORMATION OF HORSELESS VEHICLES.

By MISS CLARA FAZAN.

WHEN Miss Bacon did me the honour of asking me to read a paper on the "Reformation of the Horseless Vehicle"—to reverse a well-known phrase, it was rather in anger than in sorrow that I consented to give a dissertation upon its iniquities; and self-preservation being the first law of nature, to implore those intrepid motorists whose knowledge gives them power over the steel steed, to lose no time in reforming their hobby-horse.

To the lover of novelty, the person to whom speed and the pleasure of out-distancing all other forms of

traffic is omnipotent, and the peaceful dwellers in hamlets, whose nerves are unshattered by the babel of Babylon, automobile travelling, even in its present (if I may call it so) embryonic stage, may have a "fascination frantic," in an age when everything is done in a hurry and the most noticeable effect is the increase of insanity. But alike to many a long-suffering pedestrian, more go-ahead cyclist, and more especially to the aesthete and the artist, the horseless vehicle appears, alas! too often as the mechanical Frankenstein of the 19th century.

Sitting in one's office or study, the whiz and whirr of the ever-passing motor-car is distracting in the extreme. Driving the soon to be out of date horse, or pedalling along the once fragrant lanes, we find the odour of honeysuckle and rose, and the indescribable sweetness of meadow air, submerged in the overpowering smell of paraffin with which the ubiquitous automobile in front of us poisons the atmosphere. Who can enjoy the glories of a sunset with a landscape seemingly saturated in petroleum? Or the babble of the brook and the song of birds, when accompanied, or even silenced, by the clatter of machinery. "Sweet are the uses of Adversity"—and the motor-car, and if my information be correct, there is even more similarity between them when the latter combines weal and woe. To put the curb on sentiment, and voice my complaints in order to suggest remedies, I will with your permission start with the appearance of the horseless vehicle. Much has been done to make the motor-car less strange-looking and cumbersome, but there is plenty of room for improvement in a great number of carriages on the market. In many cases the machinery is far too much *en evidence*. Mechanism, no matter how skillfully contrived, does not appeal to us as a thing of beauty; the reason probably being because it is absolutely unlike any natural production, true beauty of colour or form being either natural or an excellent imitation of nature. Tanks in the front or at the rear, however well encased, spoil the appearance of a carriage. The car is too often adapted to the machinery, whereas the machinery should be adapted to the car. In petroleum motors it is difficult, I believe, to remedy this defect, as placing the business portion underneath the body is likely to increase vibration. With electric motors the problem is to a large extent solved, as given a properly slung body, the storage can be located underneath the vehicle.

To pass on to another point. The vibration on most self-propellers is trying in the extreme, and is a grave source of danger to physical well-being. The medical profession to a man (or a woman) is agreed on the evil effects of constant oscillation on the nervous system. In order to minister to our comfort and pleasure there must be neither jolting nor jarring.

A third and very serious complaint is the noise made in progression by the automobile. The car of the future must be noiseless if "*mens sana in corpore sanum*" is to be the motto of all who seek the commonweal. The representative of a motor firm remarked to me: "It is only because people are not used to the hum of motors that it worries them; in time you won't notice it; the horse's hoofs make quite as much noise." Whilst one admits the truth of this gentleman's reassuring statement, still, getting used to it means probable destruction of nerve-tissue which can only be renewed, if ever, by weeks of rest.

Simplicity of construction and general reliability are other essentials that must not be lost sight of. Most of the automobiles are far too complex. To arrive at the "true inwardness" of the auto-motor is calculated to

take years off the life of the ordinary pleasure-loving mortal; whilst to be initiated into a few of its mysteries is enough to bleach one's hair! On the other hand, to attempt to guide a motor with whom one has only a "bowing acquaintance" is, if not actually to court disaster, at least to run the risk of a good deal of annoyance. "The unexpected always happens" should be the watchword of every automobilist. Provided you are a past mistress in the gentle art of "moting" you should take a smithy concealed under your seat in order to be even with its many eccentricities. The very thought of controlling machines of this kind is far from cheering, as witness the following description of an ordinary motor: "The back wheel was the driving wheel, the two front were steerers, in the manner shown by cycle heads and forks. The fly-wheel on one side was balanced by a tank holding four-and-a-half gallons of water placed upon the other side. The exhaust box or silencer was placed in a very prominent and unsightly position at the back of the frame behind the driving wheel. The tank for the Tea-rose kerosine was placed just behind the back of the driver" and so on; but I will spare you more; and this describes one of the machines from a motor show. The two seats were placed tandem, so the tank of kerosine would be between the travellers—one must indeed be an enthusiast to put up with such a combination of aquarium and oil-shop. Such a description makes one long for some other motive-power of greater simplicity. The objection to electricity is the weight of the necessary cylinders, but a friendly electrician dropped a hint only a few days ago of a less weighty method of storage which has been discovered, and will before long be public property. When this happens, electric-cars will come more to the fore as being cleaner, less vibratory (I am referring to the newest principle), simpler in construction, non-explosive, and less likely to get out of repair. There are electric mains in all large towns, which can be tapped at a charge of 3d. per Board of Trade unit, and I hear that this is likely to be reduced to 2d.

Carbonic acid gas has been tried as a motive-power with some success. Here there is a field for the lover of nature, and more particularly the vegetarian—a crusade in fact which only waits to be started. Carbon-dioxide is the gas loved of plants, therefore we have in this a new opening for the philanthropist. Take your motor into your garden (or to be truly philanthropic, some other person's garden) well charged with (to quote the chemical formula)  $\text{CO}_2$ , and deal out gaseous nourishment to all the denizens of Flora's domain. A telegraphic whiff in advance will surely make the roses rear their crimson and white heads, whilst "The lily will whisper, I wait." As a new idea, and if successful, a profitable one—think of the early strawberries—it might be worth trying. The woman of the future who goes "slumming" with a motor laden with oxygen will indeed be a benefactress of the first order. The art of compressing and liquifying air is still in its infancy, and I look forward to the day when this shall be used as a means of propulsion. To describe a woman as gliding her ethereal way will be no mere figure of speech when compressed ether forms her motive-power. Experiments are now being made in this direction, and the results are encouraging enough to warrant us in believing that the 20th century motive-power will be upon these lines.

The motor of to-morrow must be odourless. When the title "Reformation of the Horseless Vehicle" was suggested to me, the word "reformation" set me thinking. I knew these petrol motors were always in bad odour; but I did not feel that the word reformation quite fitted the case—it seemed too personal—until I met an engineer, who told me that the bulk of machines could never go the pace unless alcoholically excited. So, motor-lovers, your iron horse is a tippler of the worst type, for it utterly refuses to work unless consuming large quantities of petrol-spirit. I am no longer surprised at its noisy habits and unaccountable lapses into idleness. What I look forward to is a total abstinence car. Sign the pledge for your motors and provide a substitute for this evil-smelling and fiery stimulant, and so make them quiet citizens; and then, when you take them into the country the birds will again carol undisturbed, and the air, no longer poisoned by the breath of an unregenerate automobile, be laden with health as of yore.

Kindly understand that in speaking of the great army of motors alike offensive to soul and sense, I do not wish to in any way disparage the motor industry. There are many brilliant exceptions—only yesterday one loomed on my horizon. During the past week I have been an anxious enquirer into the morals and manners of motors. Having received a hint of the existence of a well-behaved, and needless to say, after the foregoing remarks, a blue-ribbon automobile, I sallied forth in search of at least one righteous car in this Sodom of motors. My quest was partially successful, since, although I did not succeed in seeing the "electroller" itself, its internal economy was fully explained to me by an expert in mechanics. The motive-power is electricity, it is absolutely oilless, and therefore odourless, clean in use and non-explosive. That means a saving in your insurance policy. It is controlled by a switch to run three, six, or twelve miles an hour, or for those who wish to emulate the speed of its oleaginous forerunner the stormy "petroller," four, six, twelve and sixteen miles an hour. The electricity is stored in cells hidden from view under the seats or floor of the carriage, and do not require to be taken out for re-charging, the side of the vehicle being fitted with a concentric plug with cable connection for electric mains. It is claimed to run fifty miles without re-charging at a cost of about  $\frac{1}{2}$ d. per mile; and is fitted with single tube pneumatic tires with patent valves giving pumping facility for special pressure of 120 pounds per square inch. Judging from photograph the appearance is good, whilst the running is said to be smooth and noiseless. A representative of this motor firm told me that four persons can run to Brighton on one of these carriages at 10d. per head.

I hope for great things in the formation of a Ladies' Automobile Club,

viz.:—the suppression of all unnecessary vehicular noise, the encouragement of elegance in auto-car building, and the putting down of "scorching." I call upon members to discourage any vehicle which is an annoyance or eye-sore to others. The objectors to the noise, the odour, and the appearance of a large number of motors may be the weaker brethren, but humanity demands that they should be studied. Conservatism and Sentiment find it hard to accept the Age of Machinery, but it is well to remember that whilst practical common-sense "grasps the skirts of happy chance," and "takes the tide at the turn," Sentiment has been, and always will be, at the root of all that is best and noblest in life.

When the members of this club in reforming their cars are not content with utility alone but must add those details, perhaps, of silence and grace, it is Sentiment that will have put the finishing touches to their then work of art. It is hoped that women coming to the fore, as they should in this club, will in the choice of their cars—putting by the good to win the best—give such an impulse to mechanical skill as to make Automobilmism but the harbinger of Aerial Navigation.

## MOTOR-CAR ACCIDENT.

ON Monday evening, the 17th instant, the main street of Thurmaston was the scene of a remarkable accident. A motor-car was being driven by a man named Wm. Nash, Mrs. Mary Felsted, of Thurmaston, being a passenger, when suddenly a wheel collapsed, throwing the conveyance across the road, and damaging a house. Mrs. Felsted was thrown out of the motor-car, as well as the driver, both receiving a shock. P.C. Jelley rendered every assistance to both, and took Mrs. Felsted to the Leicester Infirmary, where, however, the beds were full, and she had subsequently to be taken home, where she is now progressing favourably. The driver is also doing well.—*Leicester Post*.

## TRYING A MOTOR-CAR.

AT the Guildhall Court, on Friday, the 20th inst., before the Common Sergeant, an action was tried in which the plaintiff, Mr. F. Lindus Forge, architect and surveyor, of Woodford, sued Friswell, Limited, of Holborn Viaduct, London, for the return of a deposit of £30 paid on the purchase of a second-hand Arnold-Benz Car.

The defendants counter-claimed for the balance of the purchase-money, £80. The car was purchased by the plaintiff subject to a trial ride, which the defendants denied, stating that "It was not the custom of the trade to give purchasers trial rides." The plaintiff stated that at the trial the car took one hour to accomplish a distance of three miles, and stopped during the journey eight or nine times, and it would not climb a gradient of 1 in 40 with two up. This being extremely unsatisfactory, the car was returned by the plaintiff, who requested the return of his deposit, which being refused, the above action took place. A verdict was given for the plaintiff on both counts with costs.

## A FINE FOR NOT STOPPING.

AT Steyning, Sussex, last week Henry Dean was summoned for not stopping a motor-car when requested to do so at Washington on September 28th. George Town, the driver of a four-horse charr-a-banc from Worthing to Bramber, said he met a motor-car outside Washington. It was travelling at fifteen or sixteen miles an hour. His near leader was restive, so he pulled up and called out to the motor driver to stop. The motor neither stopped nor slackened speed. The near leader was startled, and turned right round. Town and his guard could not identify Dean as the driver of the car, but the latter practically admitted this. The motor belongs to the monastery at Storrington. There was the usual conflict of evidence as to its speed. Dean said he was not travelling more than seven or eight miles an hour when he met the charr-a-banc. He sounded his horn and was not asked to stop. The magistrates convicted, and imposed a fine of 5s. and 7s. costs.

## THE FATAL ACCIDENT AT DONCASTER.

AN inquest was held at Doncaster on the 19th inst. upon Robert Edmund Henry Wilson, aged eleven, son of Robert Wilson, smith's striker, Bridge Terrace, who, as briefly mentioned in our last issue, was killed by a motor-car in St. Sepulchre Gate on Wednesday, the 18th inst.

Randolph Stebbings, the driver of the car, said he had been with the Daimler Motor Company for six weeks for the purpose of learning to drive. On Wednesday night he had nine passengers, and when in St. Sepulchre Gate a dog ran across the road from the right, and passing the right front wheel ran into the left wheel. The steering lever was thrown out of his hand, and the car swerved into the pavement, knocking down and, unfortunately, killing the boy. The car weighed 1 ton 2 cwt., and was going at the rate of eight miles an hour, as shown by the speed indicator. That was the speed limit laid down by the Corporation in the borough. The dog caught him unawares, and he had no chance of putting the brake on.

The jury returned a verdict of "Accidental death," and added a rider to the effect that greater care should be exercised in the speed of vehicles, and thoroughly competent men should be engaged in the driving of cars.

# THE Motor-Car Journal.

Vol. I.]

LONDON, FRIDAY, NOVEMBER 3rd, 1899.

[No. 35.]

Published Weekly by CORDINGLEY & CO., 39 & 40 Shoe Lane, London, E.C.

## COMMENTS.

AUTOMOBILISTS are interested in highways, and they will find much to arrest their attention in the new "Guide to the Law relating to Highways, Bridges, Footpaths, Waterways, and Rivers," which Mr. Louis Gaches has written and Messrs. Eyre & Spottiswoode have published. Not only does this give a readable history of the subjects enumerated, but also the Acts and regulations relating to the use of locomotives and light locomotives.

The value of the work is enhanced by the quotation of leading cases and of judicial decisions with a fulness that is almost exceptional. "The public," we are told, "are entitled to use a common highway for all purposes of passage, for business or pleasure. It is dedicated for free passage to all, not to use it for sporting purposes, nor for racing,\* nor for the purpose of interfering with the enjoyment of adjoining land;\* the surface from fence to fence is subject to public rights of passage,\* and to obstruct the exercise of such rights is a common nuisance." To every clause marked with an asterisk Mr. Gaches gives authoritative cases which have decided such points, and this instance may be taken as an illustration of his method. Necessarily a large portion of the volume is concerned with matters of greater interest to local authorities than to automobilists. The Locomotives on Highways Act, 1896, and the regulations issued by the Local Government Board pursuant to the Act which regulates the automobiles, are set forth in full, and in a convenient form.

### Automobiles in Warfare.

ON Monday the Duke of Connaught and other officers in the British Army witnessed a parade at Aldershot which must be regarded as unique. Fifteen traction engines and forty trucks were being tested prior to their embarkation for South Africa. The engines with their trains of trucks were sent across country, and safely negotiated ditches and hillocks; the fact that the wheels frequently sank into the wet ground not stopping their progress. Such an incident should encourage those who are hopeful of seeing our military authorities give every attention to the development of the automobile for purposes of war and defence.

### The Automobile Club of America.

By the last mail we learn that the first regular meeting of this new organization took place on the 16th ult., in New York, about thirty-five persons being in attendance. Mr. George F. Chamberlain, in his introductory remarks, rehearsed the objects of the Club and advised co-operation with the authorities in the recommendation and enactment of conservative laws affecting the speed of motor-vehicles on the highways. Mr. Thomas Clarke, of London, a member of the Automobile Club of Great Britain, was then introduced, and told briefly of the work of that body. Reports of committees were then received. The constitution and by-laws were accepted, and the temporary

committee on membership reported that eighty-five applications had been received, of which thirty-five had already been accepted. The subject of a suitable route for the first club run was touched upon and members were advised to investigate the matter before the next meeting. General Avery D. Andrews has been elected president.

### The Halfpenny Press and Automobilism

DESPITE the assertion that automobilism is a pastime for the wealthy and only a spectacle for the man of ordinary means, the interest displayed in the subject by halfpenny London dailies would seem to suggest it is popular with the many. First, the *Daily Mail* gave a weekly motor-car causerie, and now the *Morning Herald* has commenced to tell of the "joys and difficulties of automobilism" in a column that, appearing weekly, is calculated to increase popular interest in improved methods of locomotion. When will the *Morning Post* accompany its society news with motor-car doings, and the *Times* chronicle the developments of mechanical power on ordinary roads? Are the halfpenny papers to lead the way?

### The Brighton Run.

BUT if the regular interest of the daily press is not well sustained it is abundantly manifest on special occasions, and so many representatives of the Press have promised to accompany the Motor-Car Club's run to Brighton—a programme of which appears in our advertisement pages—that the Committee have decided to arrange for a special train to leave Brighton after the banquet at 11.55 p.m. for Victoria. This should prove of great convenience to the Press, and help to ensure good reports in the next morning's papers—unless, of course, there happens to be a plethora of war news on the 13th inst.

### Motor-Vans for Chelsea Vestry.

As recently anticipated in these columns, the Chelsea Vestry are inviting tenders for the supply of three motor-vans—an announcement to this effect being officially made in our advertisement columns this week. This is of interest as being probably the first open contract for such vehicles for the use of a public body. According to the specification (which can be obtained from Mr. T. W. E. Higgs, the surveyor to the vestry), the extreme width of the vehicles is not to exceed 6 ft. 6 in., and they are to be of sufficient capacity to carry six cubic yards of sand or other material of a weight not exceeding four tons. The vans will be required to carry a load up an incline of 1 in 20 for 100 yards, at a speed of four miles an hour, and makers are not restricted to any kind of motive power. They must guarantee that the cost of working shall not exceed a certain sum per mile, to be named in the tender, and also have the vans driven for one week after being delivered without expense to the vestry. Tenders are to be delivered on or before the 21st inst., and the result of the competition will be regarded with interest by several important local authorities, as well as by makers of motor-vehicles generally.

### Automobiles for Municipal Work.

FOLLOWING the adoption of motor-vehicles by the Chelsea Vestry comes the news that a similar step is contemplated by another London vestry—that of St. George's, Hanover Square. At the last meeting of this body the Electric or Motor Traction Sub-Committee presented a report in which it was suggested that a motor dust van should be purchased or hired by the vestry for use in the parish, as an experiment, at a cost not exceeding £500. Colonel Legge said that the sub-committee had fully inquired into the matter, and had come to the conclusion that the experiment was one well worth trying. Eventually the recommendation was adopted.

### Some New Benz Motor-Cars.

IN a recent issue reference was made to the special racing car constructed by Messrs. Benz & Co., of Mannheim, for the Berlin-Leipzig race, in which it was successful in carrying off the first prize. We are now able to give an illustration of this car, which is fitted with a two-cylinder motor of 14 h.p., four forward speeds and reversing gear. As will be seen, the wheels are of wood, fitted with pneumatic tires. In addition to the ordinary condenser the car is fitted with a special water-cooling device by means of which a run of 1,000 miles can, it is claimed, be made without it being necessary to change the water. On the level, the car is stated to be

GENERAL VIEW OF BENZ RACING CAR.

capable of running up to a maximum speed of from thirty-four to thirty-seven miles per hour. While on the subject of Benz cars we may mention that the firm are bringing out a new type of vehicle for the 1900 season, some brief particulars of which have been kindly furnished us by Messrs. Hewetsons, Limited, of Dean Street, Soho, W., the agents in this country. The new car, which is known as the "Duc," is, as will be seen from the illustration on page 551, rather larger than the well-known "Ideal," and will comfortably seat three or four persons. The motive power is supplied by a single cylinder of 5 h.p.; there are three forward speeds and reversing motion, while in addition to the ordinary condenser a special cooling device is fitted so that the necessity of frequent changes of the water is obviated. It will be noticed that the new car, apart from the increased size, further differs from the "Ideal" in that it is fitted with wooden wheels.

### Snapshots Wanted.

A MONTH or so ago we stated in this column that we should be pleased to receive from readers reminiscences of their wanderings by motor-car during the past summer. As the pages of the journal during the past few weeks have testified, our request has met with a very gratifying response.

Suggestions for tours of a week or fortnight duration, or for week-ends, will be always welcome, and if these notes of travel are accompanied with snapshots of interesting spots in which the motor-car figures they will be even more welcome, and, where possible, will be given reproduction in our columns.

### Automobiles for Hotels.

THE *Hotel World* says "it is highly advisable to defer the purchase of automobiles or motor-carriages for a few years. . . . This is published for the benefit of those hotel proprietors who may contemplate the displacement of the hotel 'bus or hack by the motor-carriage." We trust our contemporary gives its readers better and more reliable advice on other subjects than on that of automobiles. For if these vehicles can be utilised by country gentlemen and others for the conveyance of visitors to and from the station at a great saving on horse-drawn carriages, the profit ought to be greater in the case of hotel proprietors and those who have frequently to put their horses between the shafts for short intervals. We commend motor-cars to the whole fraternity of hotel people.

### The "Financial Times" and Automobilism.

WHILE the *Financial Times*, in a retrospect of the three years that have passed since the legalization of the automobile on British roads, regards "the fruit as scanty, and a great deal of it poor in quality," it is inclined to believe that there is promise of more substantial results ahead for the motor-car world. Necessarily with every new industry premature financial schemes are floated to the disappointment of investors, but that experience having been got over success is certain. The attention given by society people and business men alike to automobilism is heralded by our contemporary—not to be confused with the *Financial News*—as an indication of the ultimate success of the movement.

### Automobilism in Queensland.

MOTOR-CARS, it appears, are at present an impossibility in Queensland, there being no law under which they can move about. On an application being made to the Brisbane City Council for permission to run horseless vehicles in the public streets, the city solicitor reported that until the law was altered the Council could not grant permission, stating, however, that their sympathy was with the movement, they believing it would be for the benefit of the citizens to have self-propelled vehicles. There is no doubt that the Colonies will take kindly to the new vehicles as soon as the Old Country has taken universally to the idea. The restriction in Queensland shows how closely the earlier colonists followed the lines of Great Britain; but the Government of Queensland must move more rapidly, as it is apparently three years behind date.

### American Horses and Automobiles.

AN American automobilist who has recently motored from the White Mountains through the Connecticut Valley to New York, a distance of about 350 miles, reports that "as a general rule I found few horses seemed afraid, although I have always used extreme caution, especially if a woman was driving. I think all who have had road experience have noticed that the main difficulty with a horse driver is that his mind being so much absorbed in observing the motor-carriage, he pays little attention to his beast, and many accidents otherwise avoidable may be attributed to this fact." This only bears out an opinion which has frequently been expressed in these columns.

Is it a Joke—  
or what?

case the taste is as questionable as the point of the matter is unapparent. Really, Mr. Marks ought to know better.

English-Built  
Motor-Vehicles  
for  
French Races.

MUCH more interest has lately been displayed by English automobilists in French motor-car races by reason of the entry of English competitors. So far, however, only one English-built car—that of the Hon. J. Scott-Montagu, M.P.—has taken part in such races, but it is more than probable that next year will witness a great change in this respect. We have already referred to the fact the Daimler Motor Co., Ltd., are devoting attention to the construction of racing cars, while now we learn that the recently-formed Motor-Vehicle Company, of which Mr. Harvey Du Cros and Mr. S. F. Edge are proprietors, are at present engaged on the construction of three very high power cars, two of which at least will be driven in the big French races during the coming season, and probably compete for the Gordon Bennett

AN EARLY STEAM OMNIBUS—SIR GOLDSWORTHY GURNEY'S VEHICLE, BUILT 1822-25.

challenge cup referred to on another page. The cars in question will be fitted with a four-cylinder motor of the Napier type, of which this Company is making a speciality. The standard cars of the new concern will be fitted with the two-cylinder Napier motor of 8 h.p., and wheel steering. Special attention is also being devoted to the water-cooling and lubricating arrangements, the object being to supply a car of ample horse power to climb steep gradients at a good speed with full loads, and at the same time to have all parts made sufficiently strong to run for many thousands of miles without requiring re-adjustment or mechanical attention in the workshop.

Heavy  
Motor-Cars and  
Freight  
Transport.

THAT the rapid progress which is being made in this country in the construction and adoption of heavy motor-vehicles is being watched with considerable interest in many parts of the world is evidenced by the numerous references to the same that we find in our exchanges. The *Iron Age* of New York, in a recent issue, devoted a leader to the subject, in which it was remarked that "the numerous estimates which have been made of the comparative economy in the use of automobiles of various types and of horse-drawn vehicles apparently have resulted, as a rule, in favour of the

new means of transportation. Interesting as the facts thus brought out may be, a mere comparison of the cost of the old style of vehicular transportation service with that of self-propelled carriages does not go far enough. A central feature of the situation which calls for a new era of development is that the horse-drawn vehicles are no longer capable of rendering the service which is required by the exacting conditions of modern life. This is not the first time that the horse—noble and valuable though he may be—has had to yield precedence to a stronger force. There has come a demand for a service for the transportation of freights on city streets which the horse is not capable of rendering. The capacity of the horse to draw loads has been increased by the improvement of streets and roads practically to the limit; there must now come a motive power capable of drawing heavier loads or drawing them at a higher rate of speed, and herein lies the opportunity of the motor-car. It is not intended here to disparage the use of the automobile for carrying passengers either under private ownership or for public hire. Indeed, thus far the principal demand has been for passenger vehicles. But the urban freight traffic is destined to reach a larger volume than the passenger traffic, just as has been the case on the steam railways, and the investigator who fails to take this fact into consideration will find that he has made a mistake."

New Forms  
of the Stanley  
Steam Carriage.

A NEW departure in the style of the Stanley steam carriage, which is made by the Locomobile Company at Newton, Mass., and which is now being introduced into this country, is about to be made. The new carriages will have regular phaeton tops, to meet the growing demand for a runabout or pleasure carriage that is not altogether open to the weather. The Locomobile Company has also under construction a carriage after the pattern of the American carry-all or beach wagon, with two seats, both facing front. The Stanley car appears to be rapidly gaining favour in America, probably by reason of its relatively low price, 600 dols. (£120).

THE Motor-Coupé Co., of 368 Euston Road, London, N.W., are arranging to run a number of their cars in the forthcoming Motor-Car Club's run to Brighton. Early application for seats in the vehicles should be made.

MR. FRANK F. WELLINGTON asks us to state that he has now taken up his residence at 36 St. George's Square, Regent's Park, London, N.W., and that he will always be ready at any time to supply or store motor-cars and to furnish all necessary accessories.

THE motor-car has become as inevitable as the life-boat in the London Lord Mayor's procession on November 9th, and the preliminary paragraphs now going the round of the Press, tell (as though somewhat of a mystery) of the probable re-appearance of such a vehicle in this year's procession. We believe it is the intention of the authorities to represent the progress made between 1799 and 1899, and the stage coach and motor-car have naturally been selected to represent the advance in methods of locomotion. A 1799 fire manual and one of the modern London fire engines are also to be included. Why not a motor fire engine as well?

WITH reference to the statement made in the *Engineer* of October 6th that there are probably not more than 200 motor-cars running in this country, Mr. C. Johnson, the Secretary of the Automobile Club, has this week sent us a letter in which he points out that Messrs. Hewetsons, Limited, state that they have sold over 500 Benz cars in England, and that the Daimler Company, Limited, state that up to September 30th last they had supplied 307 motors and have orders for seventy-one more. Mr. Johnson adds—"I have not received figures from other manufacturers and agents, but the foregoing will serve to show that the *Engineer* is incorrect in its statement."

## THE GORDON BENNETT AUTOMOBILE CUP.

THE following translation has been supplied to us by the Automobile Club of Great Britain:—

The Automobile Club of France have under their care a trophy presented by Mr. Gordon Bennett as an international challenge cup. This trophy is to be competed for under the following rules:

1. All foreign automobile clubs recognised by the Automobile Club of France are entitled to challenge

and compete against the club who hold the cup.

2. The recognised clubs are: The Automobile Club of Belgium, the Automobile Club of Austria, the Automobile Club of Switzerland, the Automobile Club of Turin, the Automobile Club of Great Britain, the Automobile Club of America, the Automobile Club of Germany.

Any club not appearing on this list and desirous of challenging will have to be unanimously accepted by the above clubs. Its name would then be added to the list to judge the validity of the subsequent challenges.

It is nevertheless understood that on the proposition of one of the clubs to erase the name of another club, this could be done if all the other clubs were unanimous.

3. Any qualified club wishing to challenge the club holding the cup should give notice before January 1st of each year by registered letter addressed to the President, giving the number of cars which will compete for the cup. The amount of 3,000 francs should be deposited with the club holding the cup, this amount to be returned if one of the cars engaged is present at the start. The President of the Automobile Club of France should also be informed by a registered letter, even if this club were not to be one of the competitors.

4. The cup can be competed for every year between May 15th and August 15th. If two or more clubs of the same country were accepted in the list of challengers, it is understood that each country could only be represented by three cars at the most, and in such case the clubs of the said country would have to choose these cars. In case they could not agree, the cars would be chosen in order of entry. The exact date of the race to be fixed of a common accord between the clubs interested.

5. Each club can be represented by one, two, or three cars at will, but the fact that only one or two cars of a club should start cannot deter the other clubs from their right to have three cars to compete.

6. In case the club holding the cup should receive in time the challenge of several clubs, it could choose to hold one race only in which each club would be represented by three cars at the most.

7. The cars qualified for these races are those coming under the description given in the Racing Rules of the Automobile Club of France, published in 1899, as follows:—

The car must weigh more than 400 kilos., and carry at least two passengers, seated side by side, of an average weight of 70 kilos. each, it being understood that in case the average weight should not reach 70 kilos. the deficiency would be made up by ballast.

The 400 kilos. are counted for the weight of the car when empty, this being without passengers or supplies (such as coal, petroleum, water, accumulators), or tools, spare fittings, luggage, clothing, or provisions (chap. I., rule 9).

8. The cars must be constructed entirely and in every part in the respective countries of the competitors.

9. The cars must be constructed by members of the competing clubs, and the two seats occupied during the whole time of the race.

10. Each car competing to send one delegate to form the committee, Mr. Gordon Bennett to be member of this committee, and also the Automobile Club of France, even when not taking part in the race, to be represented by one delegate.

The delegates to name a president, chosen outside of their own body, who, in case of the votes being equally divided, would have the casting vote.

If they could not agree on the choice of a president, he would be named by Mr. Gordon Bennett, or, in his absence, by the president of the Automobile Club of France.

The committee to name, not necessarily from among themselves, a starter, a judge, and the timekeepers.

The committee to see that the rules are strictly adhered to, and judge all the incidents which might take place.

11. The race, which would be a "go-as-you-please" race without any stipulated stoppage, to take place on the road, and the distance to be from 550 kilometres minimum to 650 kilometres maximum. This distance to be chosen between two towns, or apportioned into several outward and homeward journeys, but in the latter case the minimum distance of each part not to be less than 150 kilometres.

12. The race to take place in the country of the club holding the cup, with option for this club to hold it in France.

13. The start to be given at the same time to all the cars, which would be placed in the following order:—In front one of the cars belonging to the club holding the cup; then one car of each of the clubs taking part in the race, beginning with the club whose challenge was first received; after these cars, the second car of the holders, followed again in the same order by the second cars of the other clubs, and again after these the third cars in same order.

14. The car passing the post first to be declared the winner, entitling its club to the cup, even if it were the only car of this club to cover the full distance.

15. In case of a dead heat between the club holder of the cup and one of the challengers, the former would keep the cup.

16. In case of a dead heat between two of the challengers these two clubs would have to race again together under the present rules before the expiration of two months from the date of the first race, it being understood that in such case the race could be held after the period fixed under rule 3.

In case the two clubs could not agree on the choice of a road for the race, a draw would decide.

If one of the clubs should refuse to take part in the in the second race, the other club would, *ipso facto*, take the cup.

17. The cup to be left with the previous holder until the two clubs who have made the dead heat meet again.

18. In the event of one of the clubs who had challenged being alone represented at the start, one of his cars would have to cover the distance stipulated in the maximum time of twenty-four hours, failing which the cup would be kept by the club challenged.

19. It is understood that no club can ever become owner of the cup, but only hold it on the conditions fixed by the present rules.

20. Should the club holding the cup become extinct the cup to be returned to Mr. Gordon Bennett or to the Automobile Club of France.

21. All races for the cup, either taking place in France or in any other country, to be run under the racing rules of the Automobile Club of France, published in 1899.

22. Any club becoming holder of the cup or challenging for it undertakes to abide absolutely by the present rules and also by the rules of the Automobile Club of France on road racing published in 1899.

DON MANUEL OLIVA, 57 Don Martin, Madrid, Spain, owner of the largest omnibus and cab transfer company of Spain, wishes to receive catalogues, etc., from motor-vehicle builders.

## A New Benz Motor-Car.

(For description see page 548.)

GENERAL VIEW OF "DUC" CAR.

### MIDLAND MOTOR NOTES.

By "HERCULES."

#### The Identification of Motor-Cars.

I NOTICE that the Warwickshire Standing Joint Committee, at their meeting last week, considered a communication which had been received from the Surrey County Council suggesting that further regulations should be made to prevent motor-cars being driven at an excessive speed. With a view of securing the identification of any light motor it was proposed that each motor vehicle should bear a registered number. A resolution was proposed by the Rev. H. Mills to the effect that it was desirable to co-operate with the Surrey County Council, and the question was referred to a committee for consideration. It is not surprising that the county councils should be taking further action in this matter. When cars have made the journey from Coventry to London in just under four hours—an average of twenty-three and a half miles an hour—and when motor vehicles are constantly to be met on the roads in the country whirring along at a speed between fifteen and twenty miles an hour, the attention of the authorities is bound to be attracted. The desire to ascertain the speed capacity of a motor-car is a natural one, but if indulged in too freely is likely to do harm to the motor industry and cause irksome regulations to be passed affecting all who "mote."

#### The Warwick County Council.

At the meeting of the County Council, on Tuesday, Lord Hertford moved that the Local Government be written to urging the desirability of registering and numbering light locomotives. He felt that there was great public danger from the reckless way in which light motors were sometimes driven, and to clinch his argument he referred to the average speed of 23½ miles attained by a country motor-car in a run to London recently. Lord Algernon Percy wrote in support of the motion. He stated

that he had seen a coach-and-four nearly upset by a motor-car opposite his gate, and the occupants of the car rode away laughing instead of affording help or expressing regret. One Councillor, Mr. Blackham, said there was an apparent desire on the part of the Council to injure the motor-car industry, and Alderman W. Evans replied that it was a fallacy to suppose that drivers of motor-cars were not breaking the law if they did not exceed twelve miles an hour. A sensible view of the matter was taken by Mr. Broughton Dugdale, who thought owners of motor-cars would welcome a recommendation for the distinctive number. If they could fix the blame upon those who were bringing motor-cars into disrepute it would be a good thing for those who wished to use them in a proper manner. Motorists generally will agree with Mr. Dugdale. There is no desire on their part to break the law, but they are seeking to obtain the benefits and pleasure which motoring undoubtedly yields in a legitimate way, driving with care and every consideration for the public safety. It is the "scorching" motorists who are doing injury to the industry by their fast driving and want of consideration for other users of "the king's highway." Some of the fines recently inflicted should have a salutary effect upon these riders.

#### The Motor-Car Industry.

It is admitted on all hands in the Midlands that everything points to next season being a busy one in the history of the motor industry. I believe I have expressed this opinion before, and I am therefore glad to see that one of the Birmingham dailies agrees with me. The use of motors seems to be unlimited, and manufacturers will have plenty of scope for their ingenuity and enterprise. Already motor-car services are becoming not only popular but paying concerns. Motor-cars for the delivery of newspapers in country districts have been found to answer the purpose so well, that it is now suggested that rural postmen should be supplied with a light locomotive for the collection and delivery of letters and parcels. Motor-coaches are also likely to be seen during 1900. Last week I mentioned that a member of the

Coventry City Council had stated motor-wagons would soon be available for the collection of street refuse and general haulage purposes. It will thus be seen that the motor industry is full of possibilities and opportunities, and manufacturers are fully alive to the position. The best engineering skill is being employed in the construction of motors and of cars, and the results give the greatest satisfaction. The recent 100-mile tests proved conclusively that an immense advance has been made towards perfection, several of the machines travelling the distance with but one stop and without the slightest mishap. The *Birmingham Daily Mail* says: "The most prejudiced person against motors is bound to admit that the past eighteen months have seen great improvements in mechanically-propelled vehicles. A couple of years ago breakdowns were frequent, but stoppages, although not rare, are now somewhat of a novelty. English firms were then a long way behind the foreigner in motor construction, but they are now rapidly overtaking Continental firms. . . ." The same well-informed journal states that, "managed on careful business lines, there appears a good future before motor companies. The future of the industry itself is assured."

#### The New Courier Motor-Vehicles.

THE new Courier Cycle and Motor Co. are forging ahead. I was privileged a few days ago to see some of their new designs, and was much struck by the advantages which are claimed for them. I am not at present at liberty to publish particulars, but hope to be able to do so in a week or two. This firm will show three of their conveyances at the National Cycle Show at the Crystal Palace, and their stand should prove a centre of attraction.

#### A Motor-Car Service at Shrewsbury.

I NOTICED when in Shrewsbury a few days ago that Mr. F. Groves, a prominent cycle agent of that town, is running an hourly motor-chairs-a-banc service between Shrewsbury and one of the suburbs of that town, and I understand that the venture is proving successful.

#### Motor-Cycle Races.

MOST of the professional cyclists in England have taken very kindly to motor-tricycles, and no one, probably, will be surprised if motor-tricycle racing is the favourite pastime next season. Motor races seem to have "caught on" in this country: they are full of life from start to finish; there is no "loafing" as in cycle races, but a "ding-dong" race from the pistol shot to the spectators' "roar" as the winner passes the post. Nor is the race entirely dependent on mechanical power; the rider can and does materially assist his "motor," and his pedaling powers may often enable him to catch an opponent at a critical juncture in the race.

#### Leicester Corporation and Electrical Motors.

THE Gas and Electric Lighting Committee of the Leicester Corporation have set an example which may be followed with advantage by electric lighting authorities in other towns. They purpose developing to a very considerable extent in the near future their electric lighting plant, and among the machinery to be laid down will be a proper equipment for the charging of electrical accumulators. The Leicester Corporation have also done, perhaps unconsciously, the Leicester Motor-Car Co., Ltd., a good service by deciding to oppose the Bill lodged in Parliament for the construction of a light railway from Leicester to Newtown Linford. The latter place is the happy hunting ground of Leicester excursionists who wish to explore the beauties of Charnwood Forest, and in the summer especially is a very popular rendezvous. The Leicester Motor-Car Co. have already

established a capital service to Newtown, which] the construction of a light railway could not but impair. There is no reason why the Company should not be able to almost completely do the work of a light railway between Leicester, Anstey, and Newtown Linford. At any rate, the experiment would be worth trying. I am glad to report that the initial success which attended the venture of the Company referred to is being continued. The cars in use are giving every satisfaction, and the fears of some as to their serviceableness in wet and muddy weather are being dispelled. They have so far worked admirably over rough roads. It is the intention of the Company to shortly introduce the "Lifu," but there is no doubt that in the not distant future electric cars will be adopted.

#### Motor-Cars and Elections.

MOTOR-CARS were used in the municipal elections at Bordesley, Birmingham, on Wednesday, to bring up the voters to the poll. This is said to be the first time motor-cars have been utilised in the municipal history of Birmingham, and they appear to have answered the purpose most effectively. I may add that at Coventry motor-cars have been in evidence on election days for several years past.

### A DOCTOR'S LONG AUTOMOBILE TRIP.

D R. DAWSON TURNER, of Edinburgh, sends an interesting account to one of the medical papers of an automobile trip he has lately completed from Paris to Edinburgh, from which we extract the following:—

The car was a 10-h.p. Delahaye which was ordered last April, and which was promised for August 15th, but which was not delivered until September 21st. We took eight days to cover 750 miles, and the car has given me very great satisfaction. I carried with me a *mécanicien* from the works for the three days, as we were in France, but since then I have managed the car entirely myself. Motor-cars are only carried by the night boats of the Dieppe-Newhaven service. This is a great disadvantage, for it is difficult enough even by daylight to thread one's way over railway lines to the boat's side and to have the car safely embarked. When, however, we reached the boat the captain informed us that the sea was too rough to permit him to take the car, so that we had to return to the hotel. The next morning we drove the ninety-two miles to Boulogne, and after waiting there a couple of days for calmer weather we crossed by the day boat. The arrangements for embarking and disembarking the car were quite satisfactory.

We drove north *via* London, Oxford, Worcester, Birkenhead, Lancaster, Windermere, Keswick, Carlisle, and St. Mary's Loch. Shap Fell is to be avoided, not so much because it is steep, but because of the loose and stony state of the road, which is a disgrace to the county council. We ran on an average about ninety miles a day, and we always started early so as to be able to reach our resting place by 4 p.m.

THREE electric vehicles ordered by the U.S. Signal Bureau, Washington, D.C., have arrived and are being tested at Fort Myer. Two are of the delivery type, and the third is a light runabout. All of them are fitted with attachments so that horses can be used when there are no facilities for charging the batteries.

MESSRS. PHILIPP AND CO., LTD., of 46 Farringdon Street, London, E.C., an old-established firm of cycle fittings factors, have lately established a motor department. They now carrying a stock of De Dion motors, motor tricycles, Perry's and Eadie's motor frames (with or without motors), motor horns, mudguards, and all accessories.

## SCOTTISH NOTES.

### Drive Carefully.

THE weather in the North has recently been so very stormy that motoring for pleasure has been indulged in only to a very limited extent. The roads are heavy, and one soon finds that the mud, which is flying thick and fast, does not improve the running qualities of the chains, or assist much in the onward progress of the car. I was out the other day with a friend, after a long spell of rain, and we found that careful steering was a *sine qua non*. We saw a motor-van in front of us when coming down a slight hill, and the idea crossed my mind that it looked a little bit top-heavy. I wondered what would happen if the steering were erratic and the vehicle had much way on. Just at that moment the car referred to "slewed round" in a most alarming fashion, the rear wheels "skidding" violently almost at right angles to the front. I thought it was over, but after a momentary swaying it got straight again, and resumed the even tenour of its way, as though nothing had happened. Had the driver been "scorching" the hill in question, or steering in a slipshod fashion, in all probability we should have been reading in the dailies of "another motor-car accident." The necessity of exercising caution in driving down hill, whether in fine or bad weather, cannot be too deeply impressed on young chauffeurs, for a moment's deviation from a straight course, when the car gets up any speed, is almost certain to end in disaster.

### The Widespread Interest in Motor-Cars.

IT is a far cry to China, and we do not suppose any automobiles are to be seen in the country of the celestials, but there are certainly people there who take an interest in the horseless carriage movement. Letters containing rapturous accounts of the joys of motor-car touring in Scotland, backed up by occasional numbers of your readable and popular *Motor-Car Journal*, have so fired the imaginations of several young Britishers in China that they vehemently assert the first thing they intend doing when they revisit the Mother Country is to have a ride on a motor-car. It is quite within the bounds of possibility that there may be no such things as horse-drawn vehicles when the Old Country is revisited and that the travellers from over the sea may find themselves in a horseless age. If this should be the case the emphatic assertion may prove true enough, for in all probability they would find themselves jumping into motor-broughams at Charing Cross in place of the time-honoured growler. This is by the way, but it all goes to prove how interest in this movement is being awakened in places little dreamt of.

### More Experimental Work.

THERE is a good deal of experimental work going on in Scotland at the present time in the motor-car world. I may have something to say on the matter when things are in a more forward condition, but meanwhile it is best simply to mention the fact that the various firms interested in the industry are busily engaged in this work. It is a mistake to boom cars and motors before manufacturers and agents are in a position to satisfy engineers and undertake orders. There has been too much of this in the past. In one sense it is a good advertisement to the motors in question, for it causes them to be talked about; but on the other hand when promises are broken (whether unavoidably or not, the public do not care) the people most closely interested are sure to find that it does not pay in the long run to be "too previous."

"BROWN HEATHER."

ACCORDING to *La France Automobile*, M. Leon Bollée has designed a new form of his well-known voiturette, having four wheels in place of three as usual.

## THE "BARISIEN" MOTOR-VOITURETTE.

THE accompanying illustration depicts the neat two or three-seated voiturette which has lately been designed by a French military officer, Capt. Barisien, of Grenoble, and which is being made by M. Alphonse Eldin, of 21 Place Bellecour, Lyons. The motive power is supplied by a couple of  $1\frac{1}{2}$ -h.p. De Dion motors arranged in the fore part of the vehicle, and geared through the medium of a friction clutch to a longitudinal shaft, which drives through bevel gearing the differential shaft. From the latter the power is transmitted to the rear axle by means of the usual sprocket wheels and driving chains. The ignition is, of course, electrical, while special provision has been made to effect the cooling of the cylinder. In addition to the favourable position of the motors for air to circulate around the radial discs, the dashboard is arranged at such an angle as to direct the air on to the same. Furthermore, should the cylinders become too hot in the course of a long journey a small fan is provided between the two cylinders. This is

driven off the motor-shaft, but is only put in operation when desired, a small friction clutch controlled by a foot pedal being provided in connection with it. In conjunction with the fan is a small pipe through which water from a small tank can, drop by drop, be fed; the rotation of the fan thus gives rise to a fine spray of water, which, humidifying the air circulating around the cylinders, materially assists, it is claimed, in effecting the cooling of the latter. Three forward speeds and one backward motion are provided, the variable gear, consisting of spur wheels working in an oil-containing aluminium case. The body of the car is entirely distinct from the frame, which is suspended on the axles by strong springs. Compensating devices are also provided in the connections between the motors and transmission mechanism on the one hand, and the frame on the other, to prevent any jolting due to inequalities of the road disturbing the fixed relations between the former. Steering is effected by means of a small hand-wheel, while all the control handles with the exception of that connected with the variable gear are mounted on the steering standard, and are thus within easy reach of the driver. The motors are arranged to be started by means of a detachable handle; ample brake power is provided, the foot pedal controlling the band brakes being also connected with the friction clutch, by means of which the motors can be instantly disconnected from the transmission mechanism. The road wheels are of the cycle type, fitted with pneumatic tires, the weight of the car being given as 230 kilos., or about  $4\frac{1}{2}$  cwt.

A MOTOR-CAR and cycle exhibition is to be held at Lyons from the 7th to the 27th inst.

## MOTOR-CARS ON THE CONTINENT.

(From Our Own Correspondent.)

### The Sanclome Motor-Bicycle.

IN a recent issue I referred to a new motor-bicycle, known as the "Sanclome," which has lately been brought before the notice of French motor-cyclists. I am now able to send you an illustration of the machine. The motor, which develops about 1 h.p., is of the single-cylinder type working on the Otto cycle, and weighs 20 lb. It is supplied with the ribs peculiar to air-cooled engines, and is fitted with electric ignition. The engine is attached to the

lower cross tube of a diamond frame bicycle, the top tubes and back forks of which carry respectively the petrol tank and the electric battery and coil. Complete, the cycle weighs from 60 to 65 lb., and is said to be capable of running up to a speed of twenty miles per hour on the level, and of mounting gradients of 7 and 8 per cent. without it being necessary to use the pedals.

### Railway Charges.

THE exorbitant charges made by several of the railway companies for the conveyance of automobiles are continual sources of complaint, and it is with pleasure that one learns of a successful appeal against extortion of this kind. Some time ago a member of the French Touring Club despatched a trailing car by the Orleans Company from Paris to Saint-Nazaire, the freight on which was 3 fr. 35 c. Upon arrival, however, the company demanded an additional sum of 222 fr., and the Touring Club, on behalf of its member, contested the charge. The Bordeaux Tribunal of Commerce has decided in the club's favour, and ordered the company to pay the costs of the action, contending that the trailer is an *objet de carrosserie*, and not a carriage, as asserted by the company.

### Automobile Races at Vienna.

THE race meeting at Vienna organized by the Automobile Club of Austria in aid of the fund for the victims of the recent inundations was conspicuously successful, being favoured with magnificent weather, a large attendance of spectators, and excellent racing. For the various events sixty-four entries had been received, and the results were as follows:—Motor-cycle race of 2,200 metres, for members of the A.C.A., open to all types of motor-cycles weighing not more than 200 kilos., machines with front seat receiving a start of 250 metres: 1, Spitz; 2, J. Kirsch; 3, Waindosfer; time, 3 m. 6½ s. Motor-cycle race of 2,500 metres, open to all, machines not exceeding 200 kilos. in weight and having one seat only admitted: 1, Luaty; 2, Bor; 3, Rowland Hill; time, 3 m. 49½ sec. Motor-car race of 5,500 metres, for members of the A.C.A., cars not exceeding 650 kilos. in weight and carrying two persons, cars of more than 6 h.p. penalised 300 metres for each horse power in excess: 1, Baron de Liebig (6 h.p.); 2, Hugo de Fischer (6 h.p.); 3, Dr. Suchanek.

Voiturette race of 3,300 metres, open to all; voiturettes not exceeding 450 kilos. in weight and carrying two persons were eligible, also motor-cycles with seat in front: 1, J. Kirsch; 2, Eidlitz; 3, Hoffmann; time, 5 m. 35½ s. Handicap of 5,500 metres, open to all types: First series—1, Scheibek; 2, Wachalofsky-Bor; 3, Spitz; Second series—1, Dr. Suchanek; 2, Wiesner; 3, Struhatschek. In nearly every instance the successful automobiles were of French construction. The meet has done much to further the cause of automobilism in Austria, and both as an industry and as a sport its future is very bright.

### Hill-Climbing Contest.

As previously announced, the second annual hill-climbing contest promoted by *La France Automobile* is set down for decision on Sunday, November 12th, on the famed hill of Chanteloup, and already great interest is manifested in the event, more especially as the enthusiast sadly misses the regular supply of exciting courses with which he has been favoured since the spring of this year. The steepest grade attained in the course of 1,840 metres is 10 per cent., an ascent which, while sufficient to test the capabilities of all types of automobiles, is not too severe to deter the smaller cars from entering. The categories are as follows:—(1) Electric cars; (2) petrol cars weighing more than 400 kilos.; (3) petrol cars weighing less than 400 kilos. and motor-cycles with more than one seat; (4) motor-cycles with one seat; (5) motor-cycles without chains. The last class is a new creation and should prove of considerable interest. Last year the several winners were:—(1) Electric cars, Jenatzy, 3 m. 52 s.; (2) petrol cars, E. Giraud, 4 m. 36½ s.; (3) voiturettes, Jamin, 4 m. 21½ s.; (4) motor-cycles, Marcellin, 4 m. 5 s. On the 12th instant Jenatzy will again be competing, and doubtless "*La Jamais Contente*" will not only score an easy victory but will also greatly reduce the record for the course. In the voiturette category two Stanley cars have been entered, while among the motor-cyclists Gasté, the 100-kilometre record holder, figures as a competitor.

### A German Motor Delivery Van.

THE Kühlstein-Vollmer motor-tractor has already been described and illustrated in this journal (see issue of August 4th, 1899). The accompanying illustration shows a light delivery van on this system lately constructed by the Kühlstein Wagenbau Gesellschaft of Charlottenburg,

Germany, for a Berlin drapery establishment. The whole of the motor and transmission mechanism is mounted on the fore-carriage, to which any type of vehicle can be quickly attached, the motor fore-carriage taking the place of the ordinary front wheels and axle.

### Electric Vehicles in Belgium.

IN the annual report of the Société Electricité et Hydraulique, of Charleroi, it is stated that the designs of new electrical vehicles are well in hand, and that workshops for the construction of the same will shortly be established.

The company is one of the leading manufacturers of electrical plant in Belgium, and has, in addition to the Charleroi works, a branch establishment in France.

### The Motor Tests.

IN these columns I have from time to time referred to the competition organized by *La Locomotion Automobile* for the purpose of assisting owners of motor-cars in the matter of ascertaining the exact horse power developed by their engines. The actual work of testing was commenced on the 26th ult. at the factory of MM. Malicet & Blin, when a largely attended conference was held. Among the speakers were MM. Desjacques, Hospitalier, de la Valette, and Georgia Knapp, and the system under which the tests are being carried out was fully explained. The entries number 74, and 43 different types are represented. It was generally thought that the manufacturers would not enter motors, but the contrary has proved to be the case, for no less than 34 entries have been made by constructors. Full notes are being taken of such details as the capacities of cylinders and explosion chambers, the temperature of cylinders, etc., after a certain period of work, the temperature of exhaust, and the actual horse power developed by the motor. Many chauffeurs are daily visiting the scene of these important tests, and much interest is evinced in the proceedings.

### Italian Enterprise.

IT is stated that an Italian industrial company has applied to the municipal authorities of Rome for permission to institute an automobile cab service in that town. It is proposed to place sixty vehicles on the streets. Considerable progress is being made in Italy with the industry, and the successful meeting at Brescia has done much to call the attention of sportsmen to the fascinations of automobilism.

### The Nice Week.

THE Automobile Club of Nice is busily engaged in elaborating a programme for the grand fete in March, the general outlines of which have already been published. Included among the races will be one for a cup offered by M. Paul Chauchard, a vice-president of the Club.

### Accident at Saint - Claude.

LAST week an automobile belonging to La Société Electrique, and conveying three persons, suddenly came to grief on the Dortan road, near to Saint-Claude, and the occupants were decidedly fortunate to escape with bruises only. The front part of the car was completely staved in.

### M. de Bertier's Accident.

IT will be remembered that M. Léon de Bertier was prevented from participating in "Le Tour de France," consequent on meeting with an accident in the Boulevard Haussmann on his way out to the start on the morning of July 16th. The sequel to this mishap was reached on Friday last, when the magistrates of the Eleventh Chamber condemned M. de Bertier to six days imprisonment and fined him the sum of 100 fr. The offending automobilist was not present in person, but in his statement of the incident he said that, owing to the streets being quite deserted at the early hour of the morning when the accident occurred, he

was travelling at a speed of 47 kilometres per hour in order to arrive at Champigny in time for the start of the big race. In the Boulevard Haussmann he suddenly perceived a man crossing the street some 150 metres in front of the car. This individual, seeing the fast approaching automobile, hesitated until the vehicle was almost on him, and it was only by a violent swerve that M. de Bertier avoided him. The car, skidding on the greasy pavement, struck a seat on the footway and then cannoned into a lamp-post. The *mécanicien* was thrown out and severely bruised, but M. de Bertier and a friend who accompanied him were uninjured. The magistrates held that Article 14 of the Decree of March 10th, 1899, had been infringed, and ultimately passed the severe sentence already mentioned.

### The "Richard" Motor-Cars.

THE Georges Richard Company, of Ivry-sur-Seine, are now turning out motor-cars fitted with motors of 7 and 10 h.p.; they have also turned their attention to the construction of electrical vehicles, and have in addition acquired the French rights in the "Vivinus" light two-seated car illustrated in *The Motor-Car Journal* for June 16 last.

## MOBILE AND IMMOBILE.

(From "Le Figaro.")

AT the invitation of the Patents' Trading Syndicate, Ltd., 1 Chiswell Street, London, E.C., we journeyed down to Clapham, S.W., on Wednesday afternoon to witness some trials with their new motor-quadracycles and tricycles. On arriving at the Granville Cycling Academy we failed to discover the machines or any one connected with them, and although we, with other pressmen, waited some little time they did not put in an appearance.

## CORRESPONDENCE.

## IMPROVEMENTS IN DAIMLER CARS.

TO THE EDITOR OF *The Motor-Car Journal*.

SIR,—In reply to the letter published in your last from Messrs. Clarkson & Capel, in which they say I omitted to mention that my cooler was made up of their cooling pipes, and that they supplied me with the cooler, I wish to state that they did not supply it. They made parts of one cooler; the other parts were made at Lowestoft and Coventry. Furthermore, the drawing of the cooler was made before I even knew of the Clarkson pipe. I have two cars fitted with the cooler, on one of which I have used the Clarkson pipe, and on the other quite a different pipe, showing that their pipes are in no way a necessary part of my design.

Lowestoft,

Yours, etc.,

October 30th.

ERNEST ESTCOURT.

[We have also received a letter from Mr. Mawdsley Brooke (Messrs. J. W. Brooke & Co., Ltd., Adrian Ironworks, Lowestoft), in which he states that "I have superintended the fitting up of these cars to Mr. Estcourt's instructions. For one car we supplied a very considerable part of the cooler and the whole of the parts for the other, in which none of Messrs. Clarkson's tubes are used."—ED. M.-C. J.]

## THE CINEMATOGRAH ON TOUR WITH A MOTOR-CAR.

TO THE EDITOR OF *The Motor-Car Journal*.

SIR,—The past has been a week of motoring over a very hilly country, and to some places where a motor-car has never been seen before. From Barningham, Yorkshire, we went to Aldbrough, then back again to the mining district of Woodland, a small place situated on the summit of the range of hills running between Weardale and Teesdale—a steady climb all the way, with two or three of the "banks," as they are locally termed, very steep indeed. At Woodlands we were not able to obtain the accommodation we required, and so decided to motor back to Staindrop after the entertainment was over. This was quite an experience, and, having wired to some friends at Staindrop we should return that night, Mr. J. Lax, the schoolmaster there, and two other friends came over in order to enjoy the run back by night.

We left Woodland at 10.5 p.m., lamps brilliantly burning, and in all seven passengers. At the first turn in the road commenced our run down into Staindrop, about eight miles, practically all down hill with one exception—a hill known as Cockfield Fell. It was close to a colliery, very steep, and the surface a black mud churned by the continual procession of coal carts into a slimy mud somewhat of the consistency of the vaseline and black lead we use for our chains. This naturally caused the wheels to skid very much, but we mounted the hill on our slow speed quite safely.

Next day we drove to Butterknowle, still amongst the miners, and on the journey we took aboard probably the oldest man who ever rode on a motor-car. Having made the acquaintance of Mr. Bradley, who owns a colliery near, he asked if we would give him and his father-in-law, Mr. Kidd, a ride. Mr. Bradley weighed over 19 stone, and Mr. Kidd was 92 years of age last birthday. We readily consented, and both enjoyed the trip immensely.

We have just landed here from Butterknowle over a very bad fifteen out of the twenty miles of road, plentifully bespattered with black mud, which lays in such profusion near the entrance to the colliery pits. We had rather a narrow escape on this trip, for while going down a moderate gradient we met half-way a horse with a load of coal. The driver did not allow us a fair share of the road, and it seemed as though the horse was going to pass us all right; at the most critical moment, however, it swerved and backed. By

careful manœuvring we managed to get by with barely a scratch on the splashboard—but only just in time.

I am, Sir, yours, etc.,

Stanhope R.S.O.,

Co. Durham,

November 25th, 1899.

T. J. WEST,

Manager of the Modern Marvel  
Co. (Ltd.), of Edinburgh.

## "TRYING A MOTOR-CAR."

TO THE EDITOR OF *The Motor-Car Journal*.

SIR,—Referring to the case mentioned in your last issue under this title, we beg to send you the true facts of the matter between Mr. Forge and ourselves.

On July 18th, 1899, Mr. Forge came to our show-rooms and bought a second-hand car for £95. The only question that seemed to be in his mind was the noise. He was shown the motor running at its full speed, and thereupon bought it as it stood. Being told, however, by us that the chains and chain-wheels were not in the order that they should be and would give trouble, he ordered definitely Brampton's chain and chain wheels to be fitted, and also gave instructions for the car to be repainted and re-upholstered, and moreover confirmed this arrangement by letter and sent a deposit of £30. When the car was finished it was sent from here to Woodford by a man who was to have received cheque or to bring the car back. Unfortunately, the motor did not go very well at the time, and it was brought back, after which Mr. Forge asked us to return his deposit, which of course we refused to do, although we offered to supply a new car or any other. We hold his letter in which he says he could not afford to pay a bigger price, although as a matter of fact he went elsewhere and bought a new one. He issued a Lord Mayor's Court summons for the return of the deposit, and we put in our counter-claim for the balance of the purchase, and although we were absolutely correct in our proceedings the jury took Mr. Forge's view of the matter and gave a verdict against us.

So far as trials are concerned, every car in our possession is ready for trial at a few minutes' notice, and we have never hitherto sold a car without giving it any trial our clients asked us to.

Yours faithfully,

For FRISWELL, LIMITED,

C. FRISWELL,

Managing Director.

November 1st, 1899.

## THE MOTOR-CAR CLUB.

TO THE EDITOR OF *The Motor-Car Journal*.

SIR,—Referring to the letter of Mr. Frederick W. Baily, Honorary Secretary to the Motor-Car Club, published in your last issue, and which is a reply to my first letter, the case of the Motor-Car Club stated shortly appears to be as follows:—

In the *Automotor* of August, 1897, the following paragraph appeared: "The Motor-Car Club was ostensibly social in its aims, but was really a commercial adjunct to a business, and hence did not command the support of the leading British automobilists, and therefore failed."

I cannot learn that this statement was ever denied. Recently, however, we have been informed by the journals and by other means that the Motor-Car Club is under new and independent management, and is no longer under the control of, or subsidised by, or in any way connected with, its first president, Mr. H. J. Lawson, or with the British Motor Co., Ltd. My letter, which you were good enough to insert in your issue of October 20th, was intended to give the new management of the Motor-Car Club an opportunity of putting themselves right with automobilists in general by giving such information as the public have a fair right to expect to receive. Mr. Baily, in his letter, does not seem to welcome the opportunity which I have given to him. He does not make the statement that I hoped for—that the Club is not connected with or subsidised by its original president, Mr. Lawson, or by the British Motor Co., Ltd.; he does not guarantee that the name of the Club will not be allowed to be used either directly or

# The Berlin Electrical Cabs.

FIG 1.—GENERAL VIEW OF "DROSCHKE."

indirectly in the promotion of companies; he does not publish or place at our disposal the information which is supplied to all inquirers as to the status of the Automobile Club—namely, the list of its committee and of its members, and reasonable information of its constitution and rules, and a list of its guarantors and donors, with the sums subscribed or guaranteed towards the Club's advancement. He fails to see why ladies and gentlemen invited by his Club to join in a run should necessarily wish to have information on these points.

He states, rightly, that I am a member of the Automobile Club, and I take this opportunity of saying that I know enough of the feelings of the members of that Club to feel sure that they would welcome the formation of genuine motor clubs whose object is the general advancement of the cause; but it is evident that such clubs must be able to offer such reasonable information as that I have asked for in support of their claims to be considered independent bodies and unconnected with trade interests.

Space does not permit me to reply more fully to the other points in Mr. Baily's letter—which are, as a matter of fact, not relevant to the question. The letter of Mr. H. G. Thomas needs no reply, as it appears to be a repetition of the statements made in Mr. Baily's letter.

Thriplands, Kensington Court, W. Yours faithfully,  
October 31st, 1899. R. E. CROMPTON.

[We have received another letter on the subject, which pressure on our space unfortunately compels us to hold over till next week.—ED. M.-C.J.]

IN previous issues of this journal illustrations and descriptions have been given of the types of electric cabs used in London and in Paris. We are now able to publish a brief description of the vehicles which have lately begun to ply for hire in the German capital. The difficulties to be overcome in designing a motor-cab to comply with the police regulations in Berlin are considerable. Practically all motors, except the electro-motor, are excluded, and the dimensions of the electrical cab are required to correspond very closely with those of the horse cabs at present in use. In consequence of this the builders—the Berliner Maschinenfabrik (Henschell and Co.), 97 Schillerstrasse, Charlottenburg, Berlin, based their production on an ordinary horse-drawn "droschke," with the results shown in the accompanying illustrations (Figs. 1 and 2). It was impossible to fix the motors in the most convenient position for transmitting power to the driving wheels, the only space available being that beneath the driver's seat. Here two electro-motors *M* are fixed, each weighing 110 lb. and developing 2 h.p. The voltage of the motors is 85, and the number of revolutions 1,100 per minute. A new departure in these vehicles is the employment of a flexible power-transmission shaft *W*—made in accordance with the firm's own patents—between the electro-motors and the intermediary shaft. The motors are independent of each other, each being provided with one of the above-mentioned flexible shafts and geared separately, one to each of the rear road wheels by sprocket wheels and driving chains, thus dispensing with differential gear. By a special arrangement of the controller one motor is capable of driving the cab, at a reduced speed, in case the other motor should break down

The motors are rigidly attached to the body of the cab, which is suspended by springs on the axle, the flexible shaft compensating for any variation in the relative positions of the motors and the transmission gear due to inequalities of the roads traversed. The flexible shafts are supported at their ends on roller bearings, and are claimed to give a greater efficiency than spur-gear transmission.

The battery of accumulators is carried in a box *B* under the vehicle, and this box can be removed and replaced by another with fully-charged cells in from two to three minutes. The battery has a capacity of 60 to 70 ampere-hours, which suffices for a journey of from 30 to 40 kilometres on one charge; it consists of forty-four cells of the Hagen type. The controller *H* is manœuvred by the driver's left hand; it is arranged to give a wide range of forward speeds and reverse motions, while provision is made for the motors to act as electrical brakes, the necessary resistances being under the driver's seat. In addition to the electric brakes, band brakes

FIG. 2.—DIAGRAMMATIC ELEVATION.

on the rear wheel hubs, and actuated by a foot pedal, are provided. Steering is effected by the hand wheel *S*, which is connected with a pinion arrangement on the fore-carriage turn-table.

The droschke is fitted with wooden wheels and solid rubber tires, and weighs complete 1 ton 510 lb. Excluding the driver it can accommodate five persons, and can attain a maximum speed of 18 kilometres per hour—the average permitted by the Berlin police is only from 12 to 14 kilometres.

In view of the success achieved with the vehicle above described, we may add that Messrs. Henschell are now making a specialty of converting horse-drawn carriages into electrically-propelled vehicles.

MESSRS. J. AND J. HASLETT, North Street, Belfast, are carrying a stock of motor-car spirit and other accessories for automobilists.

MESSRS. IRVING BROS., Coupar Angus and Dundee, have been granted permission by the Dundee magistrates to run a motor-wagonette for ordinary traffic.

MESSRS. JOHN HUTTON AND SONS, Summerhill, Dublin, have been appointed agents in Ireland for the Hurtu cars of Messrs. Marshall & Co., Clayton, Manchester.

A JUDGMENT for £164 has been entered against the National Motor-Carriage Co., New York, in favour of C. A. Tower and Geo. L. Weiss, of Cleveland, O., who had made prepayments on motor-carriages which were never delivered.

MESSRS. P. SAUNDERSON AND CO., LTD., is the style of a company which has been registered, with a capital of £20,000, to acquire the business carried on by H. P. Saunderson at Kempston Road, Bedford, and to carry on the business of wind-motor and motor-car manufacturers, engineers, etc.

THE members of the Automobile Club of America and their friends have arranged a run for November 4th from the Waldorf-Astoria, New York, at ten o'clock in the morning, to Ardsley, where dinner will be served. The run home will be made late in the afternoon or evening. It is expected that between fifty and sixty automobiles will be in line.

## RACIAL TRAITS IN MOTOR-VEHICLE DESIGN.\*

JUST as the art expert in glancing at pictures in a picture gallery can well divine their origin, so can the trained eye of the engineer usually tell the birthplace of a motor-carriage he sees on the road. In fact, not only can one tell the nationality of the design, but frequently also that of the manufacturer, since a French carriage built in France looks very different from one of French design built in England.

Comparing the representative types of motor-carriages of the different nations, we shall consider the motive power used, the method of driving and steering, and the general build of the vehicle. As regards motive power, we might say that it is principally electricity in America, oil in France, England, and Germany. The reasons for this difference are not far to seek. In the United States the electrical industry has made such progress as to enable electric pleasure carriages to be run quite satisfactorily. Moreover, the majority of motor-carriages running in American cities are two or four-seated vehicles for the conveyance of passengers, and rarely travel outside the city limits over hills and bad roads, and the distance to be covered is seldom greater than one charge of the batteries will allow.

In France conditions are different. If you can build a carriage with plenty of taps, floats, levers, hand wheels and adjustment screws on the outside you are sure to meet the French taste, and if you operate it with oil there will be a chance that the carriage will get stuck on the road and give the *chauffeur* an opportunity to prove to his own satisfaction and that of his friends that he is a genius and able to make things revolve after tickling the mechanism for some little while. It seems that while motor-carriages to be popular in America and England must be comfortable vehicles, manageable and reliable, they are preferably so constructed in France that it is an art to sit on them when they are moving, and that nobody but their proprietor thinks he knows what all the mechanism is for. The German oil carriage is in most cases far simpler than that of French design, though the Daimler motor, a German invention, is being largely used in both French and German vehicles.

Electric-motors, where possible, are most desirable, as they are rotary and most readily applied to revolve the wheels. But in England and Germany, leaving out of consideration the rest of Europe, the motor-carriage has to serve a different purpose. It is much used to run in districts where there is no steam railway or electric tramway, and has to make long journeys with one charge of fuel, or, rather, be able to replenish the exhausted source of power *en route*.

Electricity, of course, is not adapted for this purpose. No battery will stand the jar and jolting of rough country roads without being soon disintegrated, and as regards the weight, we know that 1 lb. of weight does not represent more energy than 7 to 10 watt-hours in the best type, and that where we wish to run some distance the dead weight to be carried will make electricity prohibitive. Oil, coal or coke will burn up and lighten the car, but electric batteries remain just as heavy whether they be charged and representing the source of motive power, or whether they are exhausted and nothing else but ballast. So it comes that oil is largely in use abroad. Of course, the average Englishman is not yet fond of this means of locomotion, and the most perfect oil carriages built in England are making their way rather slowly into popularity.

\* By A. H., in the *Horseless Age*.

It seems to be the standard practice abroad to attach the engine in front of the vehicle and drive backward by means of gear wheels, shaft and double chain. Some French carriages still use belts, but in England, with her quick climatic changes, belts do not seem to prove attractive for the purpose. The driving is in a few carriages effected in front, after the style of some of the electric cabs running in New York. The idea is that such a carriage will steer straighter and ride with the driving wheels first over an obstacle, where otherwise the steering wheels might be thrown sideways and the vehicle caused to skid.

Much ingenuity is shown in French steering gears; generally, however, the Ackermann gear, or articulated axle, is considered the best, and is most in use. Gearing and chains being prominent parts of European vehicles, these have been designed with great care, and one has to admit that they give much satisfaction as they are arranged at present. As a rule they are encased (dust proof), and show little signs of wear after hard use.

In the general build of vehicles it is noticeable that the English carriage is much heavier in proportions than the French. One might say it is the old excuse of the English designer to pride himself on the substantial character of his work instead of acknowledging that he did not know how much lighter he could build without coming to grief. But it must be admitted that it is a mistake to make a motor-carriage frame light when it has to be durable. The twisting and racking when on the road is very great, and however elastic the connection may be between wheels and motors, the latter should be on a rigid foundation, which means attached to a heavy frame. It is just the difficulty in making a compromise between these two opposing desiderata, elastic vehicle and rigid engine base, which accounts for most failures in motor-vehicle design.

One great point in favour of English carriages I have seen is that their centre of gravity is usually lower than in the French carriages. This, I consider, very desirable, as it facilitates rapid brakeing without the danger of upsetting. Top-heavy vehicles are besides dangerous in taking curves, though it seems that the popular London 'bus, a most unmechanical-looking affair, does quite well in balancing its outside passengers.

As regards the finish and outlines of the carriages, it must be admitted that those of French design are more graceful than the English types. One has only to look at the London electric cabs—or look back at them rather, as they have not been running for some weeks—to become permanently discouraged at the prospects of motor traffic.

On the other hand, there were some outrageous designs recently to be seen in Paris; for instance, motor mail coaches of the baroque style, and some of the carriages were so arranged that you could see a dynamo, numbers of flasks, brushes and household articles about, which plainly indicated that it did not matter if the vehicles got stuck on the road, since the tourists would have lots of fun with the things they took along!

THE Wearwell Motor-Carriage Company has just been registered with a capital of £5,000 in £1 shares, to manufacture, sell, let on hire, and deal in motors of every description, cycles, bicycles, ships, boats, launches, carriages, and athletic apparatus and appliances, etc. The subscribers are: Arthur E. Robinson, Oakroyd, Oaklands Road, Wolverhampton, traveller; Henry S. King, 17 Merridale Lane, Wolverhampton, secretary; William Clarke, Merridale Grove, Wolverhampton, cycle manufacturer; John H. Pickard, 10 Merridale Lane, Wolverhampton, works manager; Edwin Bond, 45 Mander Street, Wolverhampton, works manager; John Clarke, 158 Park Street South, Wolverhampton, works foreman; and Robert R. Rhodes, 53 Queen Street, Wolverhampton, solicitor.

## THE ARIEL MOTOR-QUADRICYCLE.

THE Ariel Cycle Co., Ltd., of Birmingham, have lately introduced a new attachment by means of which their motor-tricycle may be quickly converted into a two-seated quadricycle. The attachment, which takes the form of a small open carriage, is comfortably upholstered. The method of attachment is very simple: (1) the front wheel of the tricycle has to be removed; (2) the arms extending from the under carriage have to be fastened to the back axle sleeve of the tricycle; (3) two tubes run from the arms just mentioned, and have to be secured to the bottom frame tube of the tricycle by means of a clip and bolt. These three clips are all that is necessary to manipulate, and the change from tricycle to quadricycle can be made in about half an hour.

The body is carried upon a set of C and elliptical springs, thus giving perfect suspension. Mud-guards are provided to the side wheels, and an apron fitted to the dashboard enables the passenger to be carried well protected from wind, dust, and mud. The steering is, of course, controlled by the rear rider, and is arranged in such a manner that in taking a corner the inside wheel is not parallel to the outside wheel, the two being tangent to circles having the same centre, which centre is on the axle of the back wheels. By this system friction is claimed to be avoided, and the motor is not called upon to perform unnecessary work. The extreme length of machine, including quad. attachment, is 7 ft. 7 in., and width from nut to nut on outside of the tricycle wheels 3 ft. 5 in.

THE police authorities of Berlin have issued an order limiting the speed of automobiles in that town to fifteen kilometres (about nine miles) per hour.

MESSRS. W. W. BANNISTER AND Co., of the Crawley Engineering Works, West Green, Crawley, inform us that they have just acquired premises in High Street, Crawley, where they intend to carry a stock of motor-car spirit, accessories, etc. The firm have also lately started a general engineering business at West Green, Crawley, and are at present in negotiation regarding the manufacture of a new motor-tricycle.

THE Continental Automobile Co., with a capital of £1,600,000, has been incorporated in New Jersey. The new company has purchased the business of the Winton Motor-Carriage Co., Cleveland, O., the Manhattan Oil Motor Co., Jersey City, N.J., and the National Motor-Carriage Co., New York. The latter company succeeded the Duryea Motor-Wagon Co., and was the owner of a number of patents of Chas. E. and J. Frank Duryea. The Manhattan Oil Motor Co. owned the oil motor patents of Emil Capitaine, Frankfurt, Germany, although it was not manufacturing them for carriages, while the Winton Co. was the owner of many patents taken out by Alexander Winton. By this purchase outright the Continental Co. acquires two plants, one in Jersey City and the other in Cleveland.

## LADY MOTORISTS.\*

By MRS. BAZALGETTE.

HAVING been asked to speak at this meeting I do so in the hope that our gathering will lead to the formation of an Automobile Club the membership of which will be open to ladies as well as gentlemen, where ideas can be exchanged—ideas which may be a source of benefit and information concerning the use of motor-cars to all those interested in the new pastime. I use the word "pastime" advisedly, in preference to "industry," as I myself have little experience of automobilism except as a pleasure-giving pursuit. The time surely has passed for gentlemen to object to ladies participating in their sports. As I have owned and driven a Benz car for some three months, I have been especially asked to speak about lady motorists, and I think I can give the results of my practical experience, and present details that may be useful and interesting to those ladies and—may I dare say?—gentlemen who want to know something of the subject. My experiences may not be considered to be wide, for I have only driven a Benz Ideal and a Victoria, yet there are many gentlemen as well as ladies who have not progressed so far, and it is to them more especially that I address myself.

Before one can enjoy motoring as a pastime, one must have one's own carriage, and I should recommend the purchase of a small, inexpensive car of a good make. Any well-built carriage will do for the first performance of an amateur, even although its speed may be low, for it is generally undesirable to learn to drive on a vehicle constructed for great pace. I have studied automobiles of almost every description for some three or four years, so I have something to say concerning them. I have travelled a great deal on my own car, and enjoyed more of the country than I at one time thought possible. I generally do some ten to fourteen miles per hour, visiting such places as Southsea, Brighton, Southampton, Bedford, Norwich, and I have run swiftly on the high roads and wandered through the lanes of Kent, Oxfordshire, Warwickshire, Berkshire, Buckinghamshire, and Essex.

It is possible to drive a car with very little knowledge of machinery, if you have a skilled mechanic with you to help in case of a breakdown; but the lady motorist is in a much more happy frame of mind during her travels if she herself possesses knowledge of the mechanism of her automobile. It is so much more enjoyable to really study and understand everything concerning the car you take an interest in. You must not imagine that it is possible for any lady to acquire sufficient knowledge of the working parts of the driving machinery in a few days, or even months, but they should have the opportunity of studying it. This is one of the main objects of the club we hope to form.

Many things may happen *en route* that may tax even the ingenuity of the expert, for some slight adjustment may be necessary, and the trouble must be diagnosed before the operation can be performed. The lady motorist should at least know something about "short-circuiting," "back-shot," "compression"—as the doctor knows of a defective nervous system. She should be able to detect whether the bearings are becoming heated, or the belt is slipping, for if it does it will have to be shortened, and the process of shortening is, to my mind, not beyond the powers of a woman.

Why the pastime of motoring is so interesting is that there is always something to be learned concerning the mechanism of the car. Some experts maintain that no lady cares to start the driving wheel. Why not? The operation is perfectly easy—it requires skill rather than strength. Indeed, the machinery of a motor is so delicate in its construction that very little force is necessary. There is no sledge-hammer work. The blacksmith might be able to do repairs under the direction of an expert engineer, but for my part I would prefer to leave my car in its damaged condition rather than trust it in the hands of the giant of the smithy.

I have driven my car some 2,000 miles, and have been most fortunate in not having experienced any mishap. Yet the sceptics tell us of the dangers of the automobile! But accidents may happen to the most expert and careful driver, for there is still much jealousy and prejudice to overcome. These, however are only temporary, for the day will come when England will follow the lead of other countries, and horseless vehicles will be seen here, there, and everywhere—and probably nothing else!

Apart from the pleasure of motoring, some little consideration should be given to the profitable utilisation of the motor-vehicle. If ladies are engaged in agricultural and horticultural pursuits, and find pleasant occupation in gardening, dairy-work, fruit culture, etc., why should they not with even greater dignity drive their produce to the markets? Metropolitan dwellers revel in the delicious produce of the country, and if the motor-vehicle cheapens the transit of heavy loads, without the cost of reloading, the lady motorist can with hope look forward to the good times that are to come—and come they surely will—when ladies once discover how much enjoyment they can obtain from driving a motor-car. That a great impulse will shortly be given to automobilism no one doubts; but, like the boom in connection with cycling, it will not come until ladies take up the pastime; and the new club, the formation of which we have met to suggest, will do much to attain this end.

\* Paper read at Lady Harberton's house on the 20th ult.

## THE HIRING OF A MOTOR-CAR.

IN Hawick Sheriff Court last week, Sheriff-Substitute Baillie presiding, Stirling's Motor-Carriage Co., Ltd., Hamilton, sued Mr. A. W. Kerr, Hawick, for £10, the balance of £14 for the hire of a motor-car for a certain period in June last. The defender stated that the car should have been delivered on Wednesday evening, June 7th, and that it did not arrive until Thursday evening; that it could not be fully used on Friday in running to and from Hawick races because the brake had gone wrong; and that by the time another brake arrived on Saturday the traffic to the Moor was over, and that in consequence of the breakdown arrangements could not be properly made for proposed runs to Kelso and Jedburg on the Sunday, nor could any advertising arrangements be made in consequence of the car not being forwarded on the Wednesday evening. He had offered £2 further in settlement.

For the pursuers, it was stated that the arrangement made was that the car be delivered on Thursday, no particular time being mentioned; that the car was ready to run on the Saturday, shortly after eleven o'clock, but that the driver could not see Mr. Kerr, nor did he see him on the Sunday morning although he waited an hour and the car was ready for the journeys. The road to the Moor by the Slitrig was steep for half the distance, and on account of that and the general traffic the brake had to be applied frequently, and this caused it to fuse on the Friday.

The Sheriff found that the pursuers had not fulfilled their agreement to send the car on the Wednesday evening. He gave decree for £2 without expenses.

## A FURIOUS DRIVING CASE.

At the Cambridge Police-Court last week Auguste Souvianan, a motor-car driver, of 2 Catharine Street, Chesterton, was summoned for furious driving. He pleaded guilty.

Police-Constable Wright said that on October 18th he was in St. Andrew's Street, when he saw the defendant coming down the road on a motor-car a little over twelve miles an hour. He took no notice of witness when he called out to him to reduce his speed, although he touched the lever a little, and proceeded along Petty Cury at ten miles an hour.

Defendant said he was an experienced driver, and could have stopped the machine with two powerful brakes within a yard.

The Clerk (Mr. J. Bennett) said it was a matter whether driving along Petty Cury at ten miles an hour was reasonable or proper.

The Bench considered the defendant was driving at an unreasonable rate, and, seeing it was his first appearance in court, they fined him 10s., including costs.

## FINED FOR FURIOUS DRIVING.

At the North Holland Petty Sessions, held at Donington on Thursday last week, Mr. Charles Jarrott was summoned for furiously driving a motor-car on September 2nd, at Donington. Mr. H. Snaith, Boston, appeared for the prosecution, and Mr. Charles London, defended. Inspector Davy, Mr. Hackett (veterinary surgeon), and Mr. Ingle gave evidence for the prosecution to the effect that the car was being driven at the rate of from eighteen to twenty miles an hour. Defendant, on oath asserted he was not travelling at more than fourteen miles an hour, the machine only being set at second gear. Mr. Ingle, who created some amusement, stated the thing went past "like a whiff of wind," and he had great difficulty in holding the two young horses he was driving. Questioned as to whether he had seen a motor-car before, witness answered in the negative, and expressed the hope that he never would again. The Bench considered the case proved, and imposed a fine of £5 and £2 7s. costs.

## A PROSPEROUS COMPANY.

THE directors and shareholders of Messrs. Hewetsons, Ltd., met on Monday, the 30th ult., for their ordinary general annual meeting. There was a good attendance of shareholders, and the directors proposed a dividend of 10 per cent. for the year ending September 30th, 1899. This was carried *nem. con.*, and a hearty vote of thanks to directors and officers of the Company concluded the proceedings. At the meeting it was stated that the Company have now sold upwards of 600 Benz cars in Great Britain, and have a large number of orders on hand.

A DESPATCH has been received at the Foreign Office from H.M. Ambassador at Berlin, forwarding a memorandum received from Mr. W. S. H. Gastrell, Commercial Attaché to H.M. Embassy, relating to the motor-car exhibition opened at Berlin on September 3rd last, in the course of which the statement is made that "there is no doubt the use of motor-cars of every kind is greatly on the increase in Germany, and the making of such conveyances likely to become an important industry in the near future."

# THE Motor-Car Journal.

Vol. I.]

LONDON, FRIDAY, NOVEMBER 10th, 1899.

[No. 36.]

Published Weekly by CORDINGLEY & CO., 39 & 40 Shoe Lane, London, E.C.

## COMMENTS.

IN the course of his summing up in the case *Steward v. Day*, referred to in another part of the present issue, Sir A. G. Marten, as Judge at the Henley County-Court, made some remarks regarding horses and motor-cars which are well worth repeating and commending to the consideration of horse owners in all parts of the country. Sir A. G. Marten said "inasmuch as it is known that things such as light locomotives are free to be used on roads it becomes necessary that the training of horses and animals likely to be frightened by motor-cars should be more complete, so that they may become used to them. Horses can easily be trained so as to be perfectly safe in the presence of motor-cars or traction engines." His Honour further emphasised the point by remarking that "a totally untrained horse would be frightened at anything and would be totally unmanageable, while there are other horses which have to be trained to stand fire. Horses attracted to railway stations stand perfectly still without paying the slightest attention to locomotives and do not seem to be distracted by them." The natural inference from this is that the time has come when horse owners instead of showing so much antipathy to horseless vehicles should recognise that automobiles have now equal rights to the roads and should render their horses accustomed to the sight and sound of motor-cars. As we mentioned in a recent issue, this rational course has been adopted by those responsible for the behaviour of the horses at Windsor employed in the service of the Royal Family, and with such an example before them the time should not be far distant when many horse owners in various parts of the country will find their time more profitably spent in giving a motor-car lesson to their horses than in sitting down and writing letters to "horsey" papers against "murderous motor-cars."

### 1,200 Miles Tour in Great Britain.

AN important scheme is now being developed by the Automobile Club which may have a great effect on the motor-car industry in this country. Probably something will be heard of the matter at the Club dinner next week. Meanwhile, we may say that it is the present intention to hold a series of trials at the end of March next, which should convince everyone of the fact that automobiles can no longer be regarded as merely in the experimental stage. These trials will practically constitute a tour of 1,200 miles—from London to Edinburgh and back, with halts at leading towns on the way to show provincial people the progress that has been made during the last year or two. Some time ago we mentioned that such a test was under consideration, and there is no doubt that if carefully carried out, as the Club organization is well able to do, the venture should have a very stimulating effect on the industry. Not only that, but

it should do something to suggest improvements to manufacturers in minor details, and so educate the makers as well as familiarise the public. The route will be through Bristol, Birmingham, Liverpool, Leeds, Carlisle, Glasgow, Edinburgh, Newcastle, Sheffield, and home again, and the whole event will probably occupy a fortnight. The announcement of further details will give added interest to the dinner of the Club, a special report of which, together with the other important doings of the coming week, will appear in our next issue.

### One Vehicle or Two?

A QUESTION of interest to all motor-cyclists came up for consideration at the Grimsby Borough Police-court last week when Captain Hervé H. A. Errington Josse, of Norman Villa, Bargate, was summoned for keeping a carriage without a licence. Mr. Hawkins prosecuted on behalf of the Inland Revenue Office, and Mr. Tonge defended. The question raised in the case was whether the vehicle was one carriage or two carriages. It consisted of a trailing car attached to a motor-cycle. Mr. Tonge described it as a compound vehicle, and said the matter required settling, because if it was considered as one vehicle they would be allowed to travel at a maximum speed of twelve miles per hour, but if it was two vehicles they could not go at more than six miles per hour. Mr. Josse was willing to take out a licence for it. Mr. Hawkins pointed out that if the tricycle and trailer counted as one vehicle the licence chargeable would be £2 2s., but if they constituted two carriages, the defendant would have to pay a licence of 15s. for each, making £1 10s. in all. The magistrate decided that it was one vehicle, and imposed a fine of a guinea.

### The Motor-Car and Sport.

ALTHOUGH the motor-car has not yet been trained to take five-barred gates and follow the hounds, it is being requisitioned to carry shooting parties to the rendezvous and be of service in other ways. In this capacity motor-cars can be usefully employed when no longer employed in catering for the public pleasure or convenience, and we notice that Mr. F. W. Fitt, of Charing Cross, Norwich, is letting out on hire a motor-car carrying nine passengers for golf and shooting parties. The idea should be profitable, and we shall be glad to hear from proprietors of motor-cars as to the popularity of their vehicles for such service.

### The Automobile Club.

THE Automobile Club has just commenced the issue of a little publication with the title "Automobile Club Notices." It is intended to take the place of the many notices which are from time to time issued to members, to afford to country members and others who cannot visit the Club frequently information concerning the doings of and at the Club, and generally to keep members in touch with the important work the Club has in hand in the interests of the automobile movement. The list of members of the Club is

steadily increasing. Recent elections include: Dr. Norman Elliott Aldridge, William Henry Andrews, Lord Robert Cecil, Q.C., Walter C. Crawshay, H. Harvey George, Clarence Knight Gregson, the Hon. Arthur Ernest Guinness, William Beckett Hill, H. D. Hitchin, Robert William Hudson, William James Hunter, B.A., Sir Edward George Jenkinson, K.C.B., Captain Herve Josse, H.A., Boyle Lawrence, Francis Howard Mercer, William Tertius Pretty, Clifton Robinson, John Davenport Siddeley, and Lieut. Walter George Windham, R.I.M. The total number of members now extends to no less than 540. In addition to the annual banquet, to be held on Tuesday evening next, the 14th inst, a house dinner will be held at the Club on Wednesday, December 13th, at 7.30 p.m. During the same evening a paper on "Traffic Regulation and the Speed of Motor-Vehicles on the Highways" will be read by Mr. R. E. B. Crompton. Sir Richard Webster, M.P., Q.C., the Attorney-General, has promised to be present on that occasion, and has been asked to take the chair.

#### An Automobile Temple Bar.

THE accompanying illustration shows a novel turn-out which figured in a recent special parade in aid of funds for the building of cottage hospitals. The car, an Iveagh phaeton built by the Motor Manufacturing Co., Ltd., is owned and was decorated by Mr. Henry Seal, of Enfield Highway. The scheme of decoration is intended to represent

Old Temple Bar, which is now erected at the entrance gate of Lady Meux's estate. The whole erection was built in a framework of bamboo canes, securely lashed and cross-tied. The main portion of the erection was covered by natural green leaves, the windows, gateways, etc., being bordered by real flowers. The costumes were supposed to represent those worn at the time of Temple Bar's palmy days. It will be noticed that although Mr. Seal illuminated his scheme of decoration with fairy lights and Chinese lanterns, yet he did not attempt to carry out the realistic decorations sometimes ornamenting Old Temple Bar, and hence the absence of the "traitors' heads." The decorated car was universally admired, and the committee awarded it the first prize.

#### Motor-Cars at Aberdare.

WE have already referred to the opposition which the Aberdare Motor-Car Co. has met in its efforts to start a motor-car service in Aberdare and district. Another public meeting was held on Tuesday night in connection with the matter, when, after a discussion which met with many noisy interruptions, a resolution deprecating the

licensing of motor-cars to private companies, and calling upon the District Council to run their own motor-cars, was carried. An amendment to the effect that the District Council were not justified in spending money on any speculation, and calling upon the Council to license the motor-cars, was proposed, but failed to receive sufficient support.

#### The Coming Week.

THE coming week will be a very busy one in the automobile world. On Monday there takes place the run of the Motor-Car Club to Brighton, and as will be seen from the preliminary list of cars whose owners have notified their intention of taking part, given on another page, over 120 vehicles are expected to be present. The start of the Automobile Club's run to Sheen House, Richmond, will take place on Tuesday at 12.15 p.m., and judging from the number of members and friends who have intimated their intention of being present, this outing also promises to be very successful. The annual dinner of the Automobile Club is also to be held at the Hotel Metropole on Tuesday evening. It is sincerely to be hoped that both automobile runs will be favoured with fine weather.

#### Automobile Club for Leicester.

EVERYWHERE in the provinces greater interest is being developed in the automobile industry, and this is by no means confined to any particular class of people. Men of every profession and calling are watching the development of the industry, and many are joining in all reasonable efforts to foster and further its success. The latest confirmation of this comes from the town of Leicester, where a meeting has been held at the Bell Hotel, Humberstone Gate, to consider how the interests of the motor-car could be protected and widened. Several members of the Town Council were present, and there was also a good representation of the leading business men. Ultimately it was decided to form a Leicester and County Automobile Club, and Dr. W. A. Griggs was elected chairman of the committee composed of the following gentlemen, viz.: Messrs. F. W. S. Clarke, G. F. Brown, A. H. Whitmore, and H. R. Harding, with Mr. J. H. Petersen, 9 Beatrice Road, as secretary. Messrs. Harding and Barnett, Horsefair Street, have been appointed solicitors, and headquarters established at the Bell Hotel. Evidently there is enterprise and fraternity among the Leicester automobilists, and we hope it will result in giving a great fillip to the motor-car industry in that part of the world.

#### Provincial Branches of the Automobile Club.

REFERENCE has already been made in our columns that efforts were being made to form a Scottish Automobile Club, or at any rate a Scottish branch of the Automobile Club. The formation of the latter has been practically decided upon, and we learn that a meeting is to be held in Glasgow on the 30th inst. to inaugurate the same. We also learn that the necessary steps have been taken to form a Manchester branch of the Automobile Club, and that the inaugural meeting will be held at the Queen's Hotel, Manchester, on Thursday evening, the 22nd inst.

#### An Automobile Wedding at Streatham.

THE automobile has begun to figure so frequently at weddings that soon little or no notice will be attracted by the same. The reverse was, however, the case at Streatham on Tuesday, when a wedding party appeared at St. Peter's Church in a couple of the British Motor Coupé Co.'s motor-broughams. The drivers of the cars looked quite smart, being provided with large buttonholes of chrysanthemums, while the steering hand-wheels of the vehicles were decorated

with white ribbon. The event passed off without a hitch, the bride and bridegroom being driven away in the first car and the bridesmaids in the second, amidst a shower of rice and confetti.

#### Automobiles for Municipal Work.

THE local authorities in the London district have not hitherto been credited with the same degree of enterprise as that shown by similar bodies in the provinces, but as regards the attitude taken up with respect to the adoption of motor-vehicles they seem to be leading the way. Only last week we referred to the steps that are being taken by the Chelsea and St. George's Vestries, while now we learn that at the meeting of the Strand Board of Works on Wednesday night Mr. H. W. Bridgman moved that a motor dust-van be employed on trial for two weeks. It was estimated that a motor-car of three tons weight would effect a saving of £232 per year in the cost of dust collection and street watering. Mr. Dunscombe seconded the proposition, which was carried unanimously. While the decision of the Strand Board of Works is one to be commended, yet in our opinion a couple of weeks trial is hardly sufficient to bring out the economical and utilitarian features of horseless vehicles—the tests should at least extend over a couple of months.

#### Veils for Ladies.

IN France a fan made of celluloid is coming greatly into vogue for the use of ladies when riding on motor-vehicles. This can be held before the face, and while preventing dust, etc., reaching the features of the fair chauffeurs does not obstruct the view. In this country more conservative notions prevail, and ladies keep to the veil with something akin to tenacity. Recognising this fact the introduction of a mask-veil in which the ordinary veil is utilised seems likely to become generally adopted. Under an ordinary veil a strip of xylonite is fixed, the whole being hooked to the hat in front and fastened behind in the ordinary way. As the piece of xylonite is shaped so as to cover part of the cheeks as well as to shelter the eyes, the device is a protection that should be appreciated by ladies when riding at a good pace. It does not interfere with free respiration, and being practically invisible can be adopted without exciting the curiosity of the public. Mr. Claxton is introducing the veil to the public.

#### Our Friend Mr. Staplee Firth.

LAWYERS, however astute may be their learning and cyclopædic their knowledge, have not yet, as a rule, been able to show a general interest in the motor-car. Our columns have shown how frequently the prejudices of country justices and the attitude of urban magistrates towards police evidence has resulted in cases going against automobilists. Curiously enough, however, Mr. Staplee Firth, a legal automobilist, has had a run of success in several recent cases he has defended. It would appear as though his practical acquaintance with automobilism had served him in exposing the ridiculous assertions made by police and other witnesses. We have seen lawyers defending owners of motor-cars quite unable to cope with the technology of the new industry, and confuse matters until the case was lost. Mr. Staplee Firth, on the other hand, has combined legal knowledge with technical acquaintance—to the advantage of his clients and the credit of automobilism.

#### 4s. 6d. for a Motor-Car Smoke.

THE driver of at least one motor-car in the ancient city of Newcastle-on-Tyne has decided never to smoke while in charge of his vehicle. He did so the other day, but was summoned for the offence, and has had to pay the costs of the summons, 4s. 6d.—probably the most luxurious

smoke he has ever enjoyed. Evidently the corporation by-laws do not pay much regard to the trade of the tobacconist, an omission which even motor-car drivers will have to acknowledge.

#### A Self-Propelled Steam Fire-Engine.

IN our issue of September 22nd last we briefly referred to the self-propelled steam fire-engine recently constructed by Messrs. Merryweather & Sons, of Greenwich, S.E., for use in India. We are now able to give on page 565 an illustration of the vehicle, from which it will be seen that in general appearance it differs little from the ordinary steam fire-engine. By an ingenious arrangement of the machinery the engines can be disconnected from the fire pumps to enable an intermediate shaft to be driven by means of spur gearing. This countershaft is provided with balance gear, and drives the rear wheels by means of strong roller chains. The steering is effected from the front of the machine by means of a hand wheel, which revolves a vertical shaft attached to the fore-carriage with a small sprocket wheel and roller chain. The pumps have a capacity of 300 gallons per minute, and can force a powerful jet to a height of 150 ft. Before the engine was sent to its destination it was subjected to many severe tests as to hill-climbing capabilities, these being amply

THE "LIFU" BUS AT DOVER.

demonstrated in London, when it was found that such hills as Blackheath could be mounted at a speed of ten miles per hour, while on the more or less level roads over Blackheath to Shooter's Hill a speed of from fifteen to twenty miles per hour could be easily attained. The steering wheel, and all the arrangements necessary for regulating the steam and reversing the engine are within easy reach of the driver. A very powerful brake is provided, as well as an auxiliary brake arranged to work at the back by means of a screw and hand wheel. Seating accommodation is provided for firemen, and the entire weight of the machine, when fully manned and equipped with the necessary fuel, water, hose, and gear, is under three tons. The boiler is of the same type as that used in the construction of the engines supplied by this firm to the Metropolitan Fire Brigade, and is capable of raising steam from cold water in six minutes from time of applying a light to the fire. When the scene of conflagration has been reached the engine can be at once put into gear with the fire pumps, and got to work without any loss of time.

A SERVICE of electrical omnibuses is being started between Friedrichshafen and Ravensburg, Germany.

NEGOTIATIONS are in hand with the view of introducing a service of motor-omnibuses in the city of Budapest, Hungary.

LA SOCIÉTÉ DES FREINS STOP is the title of a new Company which has just been formed in Paris (74 Boulevard Haussmann) with a capital of £4,800 to exploit a new brake.

## MIDLAND MOTOR NOTES.

By "HERCULES."

The "Trials" of  
Midland  
Motor-Cyclists.

MOTORISTS in the Midlands think they have good cause of complaint at the treatment which was meted out to one of their number by the Coleshill magistrates last week. Mr. Harvey Du Cros, jun., of Metchley House, Somerset Road, Edgbaston, Birmingham, appeared before the bench on a summons for furiously riding a motor-tricycle on the Coventry and Birmingham road in the parish of Bickenhill on October 15th. Evidence was given by Mr. H. Eaden, of the Shrubbery, Yardley, who said he was driving on the Coventry road, near Stonebridge, when he was passed by fifteen or twenty motor-cars. Defendant was leading, and the motors were going at a speed not less than twenty-five to thirty miles an hour. Cyclists, of whom there was a number on the road, dismounted, and sought safety in the ditch at the side of the road. Witness's horse took fright at the motors. Another witness said the vehicles were going so fast that he could not recognise Mr. Du Cros. For the defence, Mr. Du Cros said the party did the distance between Birmingham and Coventry—eighteen miles—in two hours twenty minutes; they did not see the horse spoken of nor any cyclists get off their machines. There were few people on the road, it being Sunday. Mr. J. Urry, of Shirley, said the motor-vehicles were not going more than twelve or fifteen miles per hour. He denied that the horse shied, or that cyclists got off their machines. He told the magistrates plainly that the charge was a ridiculous one, as the machines could not have been driven at the pace without considerable damage to themselves. No nuisance was caused to a single individual. The magistrates, however, decided to fine defendant £2, and £1 13s. 6d. costs.

Gauging the Speed  
of  
Automobiles.

I HEARD a county-court judge observe the other day that not one person in a hundred could correctly tell the speed at which a bicycle or horse and trap were travelling as they passed. If this view were adopted by magistrates when they are trying a case like Mr. Du Cros's they would probably place little value on the statements of some witnesses. Of course, a man ought to be able to judge when any vehicle is going too fast or when the safety of the users of the Queen's highway is threatened. A great many owners of horses are largely prejudiced against motor-cars; they think motorists have no right to the highway at all; they have come to the conclusion that motor-cars are a general nuisance; and should their horses be of a restive nature and be frightened when an automobile passes they think they have a genuine grievance which should be ventilated in a police-court. If the general public treated the owners of restive horses in the same way, our magistrates would have nothing else to do but to decide cases brought against drivers. There is not the slightest doubt that many horses are a constant source of danger to cyclists and other users of the highway, but no one thinks of dragging their owners before the magistrates. And the police know better than to do so. So that gentlemen who own horses should not be the first to cast stones at drivers of self-propelled vehicles.

The Right of  
Motor-Cars  
on the Road.

STILL one does not wonder that country gentlemen should be somewhat tardy in recognising the claims of new inventions to equal rights upon the roads as themselves. One can never forget the early prejudice which was entertained against bicycles: they were held to be nuisances simply because horses could not quite make out what they were and were inclined to shy at them. The same thing is now being experienced by motorists, only in a greater degree;

and it behoves all who have taken to the new method of travelling to be extremely careful they do nothing to intensify the prejudice which a great many country gentlemen entertain towards them.

The New  
Courier  
Motor-Tricycle.

I HAD an opportunity on Monday of inspecting the New Courier motor-tricycle for two riders. The tricycle can be started without pedalling and without the use of a starting handle, by means of a rocking foot lever actuating upon a gear which the firm has patented. The machine can also be put in motion, stopped, and the speed graduated within any limit without any noise. I may also state that the aim of the makers has not been to attain an excessive speed, but to produce a vehicle which can maintain a good average pace both on the level and in climbing hills. A band brake is attached to the back wheel, and, if desired, the rider can have a perfect free wheel in running down hills. The seating arrangement is all that could be desired, and is upholstered in the best style. The front part can, when required, be converted into a carrier.

Motor Trials in  
the Midlands.

I HAVE already mentioned in these columns that a series of motor-car and cycle trials is being organized in connection with the Midland Cycle and Motor-Car Exhibition to be held in Birmingham from January 25th to February 3rd next. I have now received particulars of the competition, from which I learn that it will be open for:—(1) Single motor-tricycles, to carry one rider only; (2) motor quadricycles, to carry two riders; (3) light motor-cars or carriages, to carry not less than two or more than three passengers; (4) heavy cars or carriages, to carry any number of passengers not less than three; and (5) heavy luggage cars or carrier vans, to carry a burden of not less than one ton and two attendants. The trials will take place on the road between Birmingham and Coventry, starting from Bingley Hall and back, over a route yet to be decided upon, of which due notice will be given.

The Coventry  
Motor Industry.

THE new Mayor of Coventry (Cr. W. R. Goate), in the course of a speech on Tuesday evening at the dinner of the City Fire Brigade, referred to the motor industry as one of the trades of Coventry. It was their youngest child, he said, and had scarcely reached an age at which they could predict whether it would run alone. But he ventured to believe that it would do so, and he hoped it would become a most successful trade. It had been hampered by the fact that science had not progressed sufficiently to enable manufacturers to turn out motors cheaply. But he believed the time would come when motors would glide about the streets, and leave no smell behind. He was sorry to see that in the country there was a sort of antagonism towards motor-cars, and he thought those connected with the trade had not sufficiently considered that they had to fight against owners of horses in the country. Motorists must do nothing to aggravate this feeling, but on the contrary should give way where possible, and in course of time these gentlemen would see that motor-vehicles were necessary to civilisation. In replying, another member of the City Council trusted that the motor industry would be fostered, and that the Corporation would do all they could to help it forward. He believed it would become the staple trade of the city, and would cause thousands of pounds to be circulated.

A WEDDING was recently celebrated at St. Germain l'Auxerrois, one of the most ancient churches in Paris, at which the entire bridal party arrived in some twenty motor-cars.

## A Self-Propelled Steam Fire Engine.

(For description see page 563.)

### SOME NEW AMERICAN STEAM CARRIAGES.

**M**R. EDWARD S. CLARK, builder of marine engines and boilers, 272 Freeport Street, Boston, Mass., is the designer and constructor of a steam carriage, which has been in use for several months, and which, states the *Horseless Age*, has shown itself well adapted for road use. In style it is a *dos-à-dos*, and its weight is 1,200 lb., all supplies on. Wire wheels, 30 in. and 34 in. respectively, with hubs  $5\frac{1}{2}$  in. wide and  $\frac{1}{4}$  in. spokes, swaged down to 3-16, are employed. The pneumatic tires are 3 in. in diameter. The frame is of steel tubing; the front axle is tubular and the rear solid. Full allowance is made in the front of the frame for the inequalities of the road. Roller bearings are used in the rear axle. All the machinery is encased in the body, the compensating gear, brake and driving gear being all enclosed together in a dust-proof case on the hind axle. There are two handles, one for steering, the other for reversing and regulating speed. The latter works straight up and down, and the former may be turned over and used on either side of the seat. A band brake is operated by a pedal. The boiler is of the water-tube type, so constructed that no explosion can take place, and there are no large surfaces to burn out. The safety valve is set at 300 lb., and a diaphragm closes the fire down at 250 lb. The boiler is fired by a petrol burner. The double-cylinder, reversible engines develop 6 h.p., a special reversing device being employed. The supplies consist of 5 gals. of petroleum-spirit, and 20 gals. of water, and the seating capacity is five or six persons if desired.

Mr. F. A. Darling, Franklin, Mass., has also constructed a steam carriage for his own use. The boiler is of the regular upright pattern, 13 in. in diameter and 13 in. high, and

contains twenty-six tubes and water fire-box. It carries 250 lb. of steam. Around the boiler are two coverings, the inner one being of asbestos and the outer of Russian iron. The tank in the back of the wagon body holds 10 gals. of water. Coke is used for fuel, the box containing 10 lb. The engines run either cross compound or high pressure on both cylinders; the small cylinder has a diameter of  $1\frac{1}{4}$  in. and the large one  $2\frac{1}{2}$  in., while the stroke of each is  $3\frac{1}{2}$  in. Power is transmitted by means of a "jack" shaft, first being taken from the engine by a chain and then to the wheels by a small spur gear on each end of the jack shaft, acting on an internal gear bolted to the hub. The outside of these internal gears is used for a brake. Around each gear is a leather band, which is connected to a small steam cylinder. Steam can be let into this cylinder at any time, causing the bands to tighten and act as brakes. The wheels are 34 in. diameter front and 38 in. rear. The hubs are of cast steel and contain roller bearings. The hickory spokes are forced into a groove on the outside of the hub and bolted through the two flanges. Pneumatic tires of  $2\frac{1}{2}$  in. diameter are used. The weight of the vehicle complete is 1,000 lb.

THE Birmingham Small Arms Co., Ltd., Birmingham, is the latest concern to take up the manufacture of driving chains for motor-cars, their first production being a roller chain of  $1\frac{1}{2}$  in. pitch, and  $\frac{1}{16}$  in. wide, the breaking strain of which is given as  $4\frac{1}{2}$  tons.

THE Dunlop Co. inform us that up to the present they have only been experimenting with solid rubber tires. These have been fitted to heavy vehicles and thoroughly tested, with the result that immediately after the coming cycle shows they intend to introduce these solid rubber tires to the notice of motor firms.

## MOTOR-CARS ON THE CONTINENT.

(From Our Own Correspondent.)

### An Electric Hansom Cab.

A NEW electric hansom cab has been designed and recently constructed by M. Camille Durey, a well-known Parisian builder of municipal carts and fire-engines. There is nothing especially new about the motor, the features lying in the perfection of construction and arrangement, the carriage itself being described as a model of that which is required for town use. The accumulators are of the "Fulmen" type.

### Hill-Climbing Contest.

IN connection with this race, which will take place next Saturday on the hill of Chanteloup, it is stated that M. Jenatzy has made a wager with M. Krieger, undertaking to cover the course of 1,820 metres at an average speed of sixty-nine kilometres per hour. As M. Jenatzy has doubtless taken into account the possibility of bad weather, this speed would appear to be his estimate of the prowess of "La Jamais Contente" on a 1 in 10 grade under adverse circumstances. It is therefore reasonable to suppose that, given fine weather and a good road surface, the famous torpedo-car will accomplish an extraordinary performance in this contest. The bet is said to be one of ten lunches, and the stakes—not steaks, if you please—are in the hands of M. de Santos-Dumont.

### French Automobile Club Notes.

THE number of members of the Automobile Club of France continues to rapidly increase, and there are now 1,970 names enrolled on the books. One of the recent elections was that of Mr. Claude Johnson, of the English Club, and it is proposed to celebrate the admission of the 2,000th member by a grand fête. On the 16th inst. M. Georges Rives, the director of the two exhibitions of automobiles, will be entertained at a banquet given in honour of his promotion in the order of the Légion d'Honneur, and a large attendance is anticipated.

### M. Charron's New Rôle.

NOT satisfied with his past successes in the cycling world and his present achievements as an automobilist, M. Charron has now taken to horse-racing, and on the 30th ultimo scored his initial victory in this branch of sport. As the owner of Bisbigho he had the satisfaction of seeing G. Stern steer the colt first past the winning post in the Prix des Croisades at the Vincennes meeting, and this early success should augur well for future victories.

### German Military Automobile.

ON the 30th ultimo, at Berlin, Major Madlung demonstrated before the Emperor William four automobiles designed to carry military baggage, or in special cases the soldiers themselves. The trials are believed to have given every satisfaction, and it is expected that the German authorities will procure a number of vehicles of this type.

### Excessive Speeds in France.

THE agitation against the excessive speeds at which many automobiles are driven, often in narrow and crowded thoroughfares, is spreading rapidly, and unless chauffeurs exercise more discretion in this respect they will find their present privileges menaced by the authorities, and the now much-abused regulations re-framed on lines

infinitely more severe. Probably all French automobilists drive very fast in the country, for, generally speaking, their cars are powerfully engined and highly geared, but certainly all drivers do not conduct their vehicles at an unwise pace when traversing towns, and it is by the selfishness and the lack of discretion of the few that the whole community of automobilists will be made to suffer. Even in the country, doubtless travelling at a high rate of speed is somewhat risky, but there, whatever danger may exist threatens the voyagers themselves, and they are prepared to take their chance. In the town, however, circumstances are entirely different, and the pedestrian and the driver of the horse-drawn vehicle are continually inconvenienced, and occasionally made to suffer by the foolish conduct of certain chauffeurs. At Bordeaux, the recently-elected procurator of the Republic, M. Frémont, has written to M. Michel, the central commissioner, directing him to issue the most formal and precise instructions to the police that they shall take proceedings against every conductor of an automobile who does not rigidly conform with paragraph 2 of Article No. 14 of the decree of March 10th, 1899, which declares that the speed of an automobile shall be reduced to walking pace in narrow or encumbered streets. This order is the result of personal observation by M. Frémont, and it is to be hoped that drivers will take warning, and give the police no occasion for exercising their instructions.

### A Portable Accumulator Charging Plant.

IN the last issue of this Journal reference was made to the electrical vehicles of the Berliner Maschinenfabrik (Henschell & Co.), Charlottenburg, Germany. In connection with the same, the firm are making a very useful portable combination of petrol motor and dynamo, illustrated herewith. It is intended for the use of owners, or

those desirous of becoming owners of electrical cars, who have no handy means of re-charging their batteries. The combination is also recommended to hotel proprietors and others in country districts who are laying themselves out to cater for the wants of automobilists. When not required for charging the batteries of automobiles, the plant may be used to charge a set of accumulators to run a small electric lighting installation, or to operate a number of small motors for power purposes.

### Paris-Beauvais Motor-Cycle Race.

ON Saturday last, at 8.50 a.m., there started from the Porte Maillot, Bardin, Van Marck and Rigal, the only representatives of the original entries for the Paris-Beauvais race. Rigal soon abandoned, but the other two completed the journey of 87½ kilometres, Bardin finishing first. His time for the distance was 1 h. 51 min., the trying character of the route, more especially the portion near to Paris, making very fast time an impossibility.

**The  
Count De Dion.**

THE Count De Dion's electioneering campaign was brought to a successful termination on Sunday last, when he was duly elected General Counsellor of the Canton of Carquefou, in the Department of Loire-Inférieure. I may add that the Count utilised an automobile for making his rounds, and was thus able to visit all parts of his constituency with the greatest of ease.

FIG. 1.—GENERAL VIEW OF THE SOCIÉTÉ BOURGUIGNONNE'S TWO-SEATED VOITURETTE.

**Marmande-Paris  
Record.**

BERTIN's attempt to establish a motor-cycle record from Marmande to Paris was not crowned with success, as at Châtelleraut he met with an accident in avoiding a carriage and could not continue. At the time of his mishap Bertin was thirty minutes behind his scheduled time.

**Italian  
Enterprise.**

I HAVE already announced in these columns that there has recently been formed at Rome a company destined to inaugurate public automobile services, and it now appears that the concern does not propose to confine its efforts to this branch of the industry alone, but will also manufacture and sell various types of cars, and will institute a number of "garages" and re-charging stations. The capital of the company is £200,000, and a powerful board of directors, with the Count Henry Avet at the head, has been secured.

**Accident in  
Belgium.**

ON the 2nd instant the Count Dumonceau de Beghental, while driving his automobile down a steep hill at Auderghem, near to Brussels, made a false movement, with the result that the vehicle overturned, and the Count and his servant were thrown violently on to the *pavé*. The former suffered a broken collar-bone and the latter had his head badly cut.

**THE SOCIÉTÉ BOURGUIGNONNE'S  
MOTOR-VOITURETTES.**

WE are able to illustrate herewith in Figs. 1 and 2 the light two and three-seated petroleum-spirit motor-voiturettes recently introduced by La Société Bourguignonne d'Automobiles (Messrs. Chesnay, De Falletans and Co.), of Dijon, France. As will be seen from the plan (Fig. 3) the motor is located in the fore part of the vehicle.

It is of the Gaillardet 3-h.p. vertical single cylinder type, fitted with electrical ignition. The cooling of the cylinder is effected in a novel manner, for in addition to large radial discs a water-spray device (illustrated in Fig. 4) is provided. Referring to the last-named illustration, it will be seen that the exhaust gases pass by a pipe *B* to a silencer *C*. At the lower end of the pipe *B* branches a second pipe *D*, along which flow a portion of the waste gases, first to the carburettor *E*, to heat the same, and then into the water-spray tank *H*. A three-way cock is provided at *G* to permit the gases to pass into the air or into the tank as desired. When allowed to flow into the tank the pressure on the water causes the latter to rise in the pipes *X Y* and be ejected in the form of a spray through the orifices *V* and *W* on to the discs surrounding the cylinder. The spray of air and water which issues from the orifices when the car is in motion creates a current of humidified air around the cylinder, which the makers claim, as a result of trials, materially assists in keeping the same cool. At the lower ends of the tubes *X Y* two small filters are provided, which prevent any solid matter passing along the pipes and blocking up the ends of the nozzles *V* and *W*. The arrangement is claimed to be very effective, two litres of water sufficing for a run of 300 kilometres.

Coming now to the transmission mechanism, four speeds are provided. On an extension of the motor-shaft is mounted a four-step cone pulley connected by a single belt to a similar pulley on the counter-shaft (Fig. 3). Provision is made for the tightening of the belt by means of a jockey pulley controlled by a foot pedal. A friction clutch is also provided in connection with the pulley on the counter-shaft, by means of which the motor can be instantly cut out from the transmis-

FIG. 2.—GENERAL VIEW OF THE SOCIÉTÉ BOURGUIGNONNE'S THREE-SEATED VOITURETTE.

sion gear when driving in crowded thoroughfares, etc. From the intermediary shaft the power is transmitted by a single driving chain to the rear road axle, which is provided with a

differential gear. Two brakes are provided—a band brake on the counter-shaft, which is applied at the same time as the friction clutch is thrown out of gear, and a band brake

FIG. 3.—PLAN OF SOCIÉTÉ BOURGUIGNONNE'S VOITURETTES.

operated by a foot pedal on the rear axle. Steering is effected by means of a sloping hand wheel, on the standard of which is fitted an electrical contact breaker. The car is spring-suspended on the axles, while the road wheels are of the cycle type, fitted with pneumatic tires. Provision is made for the storage of motor-car spirit sufficient for a run

FIG. 4.—DIAGRAMMATIC VIEW OF CYLINDER COOLING DEVICE IN THE SOCIÉTÉ BOURGUIGNONNE'S VOITURETTES.

of 300 kilometres, and any desired speed up to 35 kilometres per hour can, it is claimed, be attained. In addition to the types of cars illustrated, the Bourguignonne Co. is also making one with a small "tiger" seat at the rear.

THE Sächsischen Automobil Club has just been formed in Dresden to promote automobilism in Saxony.

LA SOCIÉTÉ DES AUTOMOBILES L. CRÉANCHE has just been registered in Paris (7 Rue Brunel), with a capital of £5,000.

WE hear that the Ralpho-Watson Cycle and Motor Company, Oakfield Road, Altrincham, are about to introduce a new motor-tricycle.

AT Coleshill last week Mr. Harvey du Cros, jun., of Mitchley House, Edgbaston, for furiously riding a motor-cycle along the Coventry Road, Bickenhill, on the 22nd ult., was fined £2 and costs.

## CORRESPONDENCE.

### PROSECUTIONS IN LINCOLNSHIRE.

TO THE EDITOR OF *The Motor-Car Journal*.

SIR,—As bearing upon the recent prosecutions of motorists in the Lincolnshire district, probably my experience of "Justices' justice" (?) a few days ago may be of interest. It is quite certain that evidence is totally unnecessary for the purpose of obtaining a conviction in that district. Especially has this been the case in connection with those who were, or who might in the opinion of the police have been, concerned in Goodwin's record ride. The offence with which I was charged was for furiously driving a carriage on September 2nd, at Donington, near Spalding. This was the day after Goodwin's ride. The evidence of the prosecution was of the most remarkable description. One witness swore that we were travelling at twenty miles an hour, although at the time he saw us he was half a mile away and we were going away from him. The sergeant who lodged the information identified another person in the Court as being the driver, and it took him at least ten minutes close scrutiny before he was able to make up his mind that I was the person on the car at the time. Another witness stated that he identified me from a photograph, but upon cross-examination admitted that although there were only four figures in the photograph he did not identify me until the third attempt. This same witness swore we were travelling at the rate of 150 miles an hour (certainly a very respectable speed, and had the facts been true I should have been very pleased to have pleaded guilty and paid any fine imposed, consoling myself at least with the fact that I was on a flier). Another witness swore that we were travelling so fast that it was impossible to see how many persons were on the car, whether they were sitting side by side or behind each other; nevertheless, this witness had no difficulty in swearing that he most distinctly saw the driver! He further capped this statement by positively swearing that the *solicitor* who appeared on my behalf was the person driving the car, although this gentleman was 150 miles away on the day in question. On "evidence" of this description I was convicted, and fined the maximum amount.

The facts were as follows:—I was seated on the front seat of a Bollée at the time. I was, of course, not driving, as this would have been an impossibility in that position, neither did I drive at all on the day in question. We were not travelling fast, as although the machine had two cylinders only one was working at the time, owing to a derangement of the mechanism which occurred on the previous evening. I was not pacing Goodwin and was not stopped by anybody, and although we passed a number of policemen on the road in different places they made no sign whatever about our travelling faster than we ought to have done.

40 Holborn Viaduct, E.C.,  
November 4th, 1899.

Yours truly,  
CHAS. JARROTT.

### THE CINEMATOGRAPH ON TOUR WITH A MOTOR-CAR.

TO THE EDITOR OF *The Motor-Car Journal*.

SIR,—I am writing this at the highest village in England—Nenthead,—and our motor-car is safely stabled at the Miners' Arms, so we have brought the car, fully loaded, up one of the steepest hills in England—Kilhope Hill—and when at the top we were over 2,000 feet above the level of the sea. From the summit of Kilhope Hill to Nenthead is only one mile, a winding descent of 600 feet, for Nenthead is only 1,400 feet above sea level. The road being so wet, the band brake did not grip so well as it should, and when we reached the level ground we found that the leather of our band brake had fired. Mr. Sinclair soon remedied this, and to-morrow we start for the highest market-town in England—Alston.

Just a word or two about the other journeys during the

past week, which were Stanhope to Wolsingham, thence to Lanchester, next to St. John's Chapel, and then to this place. At Wolsingham we had run short of motor-car spirit, and as our next supply was not due until we reached St. John's Chapel, Mr. Sinclair took a run over to Bishop Auckland, when Mr. F. Shaw, manager of the Auckland Motor-Car Co., was good enough to let us have a supply sufficient for our needs. Wolsingham to Lanchester and the return journey over the same road was ten miles of the most hilly country we have yet experienced, not so steep, although one or two hills were very bad, but a succession of up and down hill all the way.

Yours, etc.,  
T. J. WEST,  
Manager of the Modern Marvel  
Co. (Ltd.), of Edinburgh.  
Nenthead,  
Cumberland,  
November 8th, 1899.

### IMPROVEMENTS IN DIAMLER CARS.

TO THE EDITOR OF *The Motor-Car Journal*.

SIR,—We fail to understand Mr. Estcourt's letter which appears in your last issue. We are aware that the cooler was fitted to the car by Messrs. Brooke, of Lowestoft, and that probably some alterations to the dash-board, etc., necessitated by the cooler, were carried out at Coventry, but essentially the cooler was made and supplied by ourselves. Although it was fitted to the car by others, and perhaps several details added, that does not alter the fact. Other cooling tubes might also be fitted in place of ours in the arrangement, and we shall be interested to hear with what result.

With regard to the other points raised, we fail to see that any beneficial results can be obtained by publicly discussing the claims made, and, as far as we are concerned, this will close the matter.

Yours faithfully,  
THE CLARKSON & CAPEL STEAM  
Deverell Street, London, S.E., CAR SYNDICATE, LTD.  
November 7th, 1899.

ACCORDING to a transatlantic contemporary the automobile never ceases to be an attraction at the modern country fair, and several persons make their living by making the circuit of the country fairs.

THE Fairmount Park Commissioners, Philadelphia, Pa., have so far relented that they are making test runs with motor-carriages to ascertain the effect on horses in the park. A resolution requesting the admission of motor-vehicles to the park was recently introduced in the Council.

THE London Motor-Van and Wagon Co., Ltd., of Tottenham Street, London, W., who are now making a speciality of light vans and cars for public service, are, we hear, arranging to let out on hire a number of motor delivery vans to meet the demands of tradespeople as regards the extra traffic at Christmas time. Not only will motor-vehicles be found admirably and economically adapted for that purpose, but their use will in itself constitute a good advertisement to the firms sufficiently enterprising to make use of automobiles.

IN their second annual report the directors of Brampton Bros., Ltd., regret that the results of the year's trading are, owing to the crisis through which the cycle trade has been passing, of an unsatisfactory character. The net profit (£412 12s. 3d.) not being sufficient to pay the preference share dividend, the vendors who hold practically the whole of the ordinary shares, having every confidence in the future of the business, have arranged to provide a sum sufficient to pay the preference dividend for the year. The directors speak hopefully of the future of the motor chain trade. They state that practically the whole of the recent trials of motor-cars in France, where the motor industry is much more developed than in this country, have been won by vehicles fitted with the Company's chains.

### THE COULTHARD THREE-TON STEAM DRAY.

THE accompanying illustration shows a three-ton steam dray which has lately been completed by Messrs. T. Coulthard & Co., of Cooper Road, Preston, for a firm of brewers at Weymouth. The vehicle is 15 ft. 6 in. long by 6 ft. 6 in. extreme width. The wheel base is 9 ft. 6 in. longitudinally and 5 ft. 8 in. centre to centre of tires transversely. The platform, which is carried on a steel frame, is 10 ft. 6 in. long by 5 ft. wide. The front wheels are of iron throughout, 2 ft. 9 in. diameter, and have tires 4 in. wide; the driving wheels are 3 ft. diameter, and have tires 5 in. wide, the front wheels being fitted on Ackerman's system controlled by worm gearing and a hand wheel. The boiler is of the fire-tube type, constructed for a working pressure of 200 lb. to 225 lb. per square inch. Water is fed to the boiler by means of a small pump, which is driven at a reduced speed by means of gearing. The inside of the boiler can be lifted out for cleaning purposes without removing any of the steam fittings. Liquid fuel is employed to generate steam. The lorry is fitted with an air condenser, placed in the front of the vehicle. The engine is of the firm's special triple-expansion vertical type, and develops 14 b.h.p. when running at 500 revolutions per minute. Spur gearing is used to transmit the power from the engine shaft to the

first motion shaft by means of clutches, while Renold's chains form the connection between the counter-shaft, the differential gear and the driving wheels. The gearing is arranged to give a ratio of 7, 11½, and 19½ to 1 between the engine and the driving wheels.

The vehicle is fitted with two brakes, a band brake on the second motion shaft and a shoe brake on the driving wheels. The former is actuated by a foot lever, the latter by worm gearing. By means of a clutch the direction of the vehicle can be readily reversed. The water tank holds 65 gallons and the oil tank 25 gallons. In the improved engine the cylinders are arranged in such a manner as to provide only a very thin wall between the bore of each cylinder, and the piston valves are at the back of the cylinders. By this system the firm claim that they are enabled to dispense with the usual central bearing, and, by using a slightly larger shaft and by careful balancing, ensure uniform pressure on the two main bearings. The hot water tank is also arranged so that the condensed steam is conveyed from the feed water heater, the air condenser, and the drain cocks on the cylinder. The object of using this hot water tank is as follows:—Assuming the cold water tank to be filled with water, the hot water tank will then be empty and the proportions of the two tanks are such as to ensure the whole of the cold water being taken from the tank before the hot water tank has been filled; the hot water is then transferred to the cold water tank, the hot water tank being afterwards filled

up. The latter tank is emptied by the aid of a water lifter, which is also used for filling the cold water tank. By this arrangement satisfactory working of the boiler feed pump is obtained. The speeds are  $2\frac{1}{2}$ ,  $4\frac{1}{2}$ , and  $7\frac{1}{2}$  miles per hour forward, and 2 miles per hour reverse.

### THE LEPAPE CARBURETTOR.

**A**N improved form of carburettor for petroleum-spirit motors has lately been devised by M. H. Lepape, of 23 Rue Montaigne, Paris. As will be seen from the sectional view herewith, it comprises a cylindrical body provided with a chamber *c* which can be closed both at top and bottom by valves, the stems of which are respectively surrounded by coiled springs *X* and *z*. The cylindrical body at its top is closed by a cap *g* through which passes an adjusting screw *V* engaging the stem of the valve *a*. In the lower portion of the cylinder a bell piece is mounted, which is surrounded by wire gauze *P* through which the heated air passes. The liquid to be vaporized enters at *m*, beneath the valves. The explosive mixture finds its exit through the tube *T*.

In inoperative position the lower valve is slightly forced from its seat by the upper valve, the two valve stems telescoping within each other. The movement of the stems is limited by stops *e*. The valves being in this position the liquid will fill the chamber *c*. When the inlet valve of the motor is open the resistance of the wire gauze will cause the cap *g* to be depressed, and, likewise, its adjusting screw *V*. The upper valve stem will then be plunged into the chamber filled with liquid.

By this operation the lower valve will be closed, thus cutting off the communication between the supply reservoir and the chamber *c*. As it continues to fall, the cap will force the valve stem *f* into the liquid contained in the chamber *c* and will cause it to displace a volume of liquid equal to that of the immersed portion. The volume immersed and consequent displacement can be regulated to meet the requirements of the motor, by means of the adjusting screw *V* of the cap *g*. By turning the collar *d* a supply of fresh air can be admitted to diminish the vacuum produced by the intake, and consequently to regulate the quantity

of liquid which falls on the wire gauze *P*, since this volume depends upon the degree of immersion of the stem. The liquid which falls upon the wire gauze is vaporized by the hot air and passes to the cylinder of the motor, mixed with air.

It therefore follows that the admission of a supply of cold air regulates the quantity of liquid which should pass to the cylinder, and the proportions of air and gas in the explosive mixture introduced within the cylinder of the motor.

The screw *E* serves to release any air from the liquid supply tube, and to permit a small quantity of liquid to flow, in order to facilitate the starting of the motor. The device is claimed to give a perfect carburation without odour or smoke.

THE Paris Salon du Cycle et de l'Automobile will be held this year at the Salle Wagram, from December 12th to the 27th.

THE New Courier Cycle Co. has been registered, with a capital of £10,000, to acquire the business of cycle and motor-car manufacturers carried on by the New Courier Cycle Co. at Alexander Street, Wolverhampton.

### THROUGH PERTSHIRE IN A HORSELESS CARRIAGE.

**O**UR Scottish correspondent, "Brown Heather," sends us the following account of a motor-car tour through that most charming of Scottish counties—Perthshire—handed to him by a friend, Mr. J. D. Brimlow. The tour, which was a most enjoyable one, was undertaken in a sporting Stanhope, hired from the Hamilton dépôt. The route chosen was a splendid one, and might well be followed by any who intend taking such a tour, but who may be in doubt as to where to go.

"Leaving Motherwell on July 29th about 7 a.m., a smart run was made *via* Denny to Stirling, which was reached about 9.30. After half an hour's delay the journey to Scone through Perth was resumed. The reason for visiting Scone was to leave one of the party to visit the ancient palace and to spend a few hours at a friend's strawberry farm. After a well-spent hour among the fruit, the journey was continued to Dunkeld, where, after refreshing the motor with water, the last stage of the journey was begun. Keeping on the north side of the Tay, Ballinluig and Grantully were passed, and at about 9 p.m. we reached our destination, a farmhouse near Aberfeldy. Throughout the day the sun shone brightly, and the running was most pleasant and exhilarating. Sunday, 30th, was spent as a day of rest. On Monday, the 31st, as the motor-car spirit was delayed in transit by the railway company, only a short spin was taken, Kenmore being the destination. This beautiful village and its environments were visited by the party, the Castle of Taymouth, in the midst of its romantic and picturesque scenery, being much admired. This imposing structure, the residence of the Marquis of Breadalbane, is most exceptional in the grandeur of its situation and architecture.

"On August 1st the direction taken was along the River Lyon to the quiet and rustic village of Fortingall. The famous yew tree (said to be 3,000 years old), the alleged birthplace of Pontius Pilate, and the well-preserved remains of the Roman Camp were all visited. Continuing up through the wild recesses of Glen Lyon, the McGregor's Leap was seen. At a certain point in the road near the entrance to Glen Lyon a stop was made, where an excellent view of the Glen, with the Lyon roaring hundreds of feet below, was obtained. The wild grandeur of this scene is unexcelled in the Scottish Highlands. Three of the party, evidently considering this district deserted, proceeded to bathe in the Lyon, as the heat was great. Whilst they were floundering about in the water, and *in puris naturalibus*, they were suddenly surprised by a party of ladies driving past. The confusion was extreme, and the position was ridiculous; but there were no casualties! After a magnificent run, over a road narrow and even dangerous at parts, Bridge of Balgie, a telegraphic terminus, was passed. Here the main road was left, the Bridge crossed, and a detour made across the hills. The road proved narrow, very difficult on account of its loose, stony surface, and the steep gradient. Every member of the party at first had to walk, but later for at least three miles to the summit all hands were compelled to aid the motor, with shoulders to the wheel. In a hot, broiling sun this task was most arduous, but was viewed with much pleasure afterwards. It was thought that once the summit was reached all troubles would be past, but it proved quite the contrary, as the downhill gradient was very steep, the road unsafe and

narrow, on one side high hills rising, and on the other dangerous and precipitous descents. Driving here was therefore a work of difficulty, but the motor was kept well in hand by Mr. B., and after about an hour's excitement the main road along Loch Tay to Kenmore was gained. This hill road was never before crossed by a motor-car, as stated by the proprietor of Lawer's Hotel, and is very seldom used by ordinary vehicles. It is unsafe for motor-car tourists, but the scenery is magnificent. At Lawer's Hotel tea was taken. The hospitality exhibited here was unsurpassed by any experienced during the tour, and was taken advantage of on as many occasions as possible. Afterwards Aberfeldy was reached after dark.

"On August 2nd no distance of importance was covered, as Aberfeldy itself was considered worth attention. The falls of Moness, immortalised by Burns, were visited, and the beauty of these fine cascades among the birks could not fail to be admired. Trying to keep up the pace of the motor, which could not be taken up the glen to the falls, the party literally trotted round the falls in truly Yankee style.

"Travelling along the left bank of the Tay to Ballinluig the party, on August 3rd, went along the corresponding bank of the combined rivers Tummel and Garry to Pitlochry. The pass of Killiecrankie demanded attention, the party leaving the car on the main road to walk along the river Garry. The deep pools and rugged rocks near the site of the battle were much admired, as well as the house visited by Marie Corelli during the last few summers. At the upper end of the pass, where the famous Queen's View is obtained, a specially narrow and precipitous strait among the rocks is known as the Soldier's Leap. Here many hundreds of soldiers during the battle of Killiecrankie fell or were thrown into the Garry. A continuation of the journey took the party to Blair Athol, where the local Duke's princely castle of Blair was seen. The journey ended here, and a fast return through Pitlochry to Aberfeldy was then made.

"Perhaps the best tour of the holiday was the next day (August 4th). An early start was made from Aberfeldy, the party crossing the hills to the south, the road through Amulree, past Strath Braun, being followed. The wild, desolate grandeur of the Sma' Glen was the striking feature of this district, and the drive through it extremely pleasant. Crieff was passed through, and a smart run made to Comrie, thence along the lovely valley of the River Earn to St. Fillans. Here no delay being necessary the journey along Loch Earn to the village at its head was pursued. The loch road is excellent, and splendid for motoring. From Lochearnhead, up Glen Ogle, the road, though steep, is good, and though the progress is slow the time is well occupied admiring the grandeur and variety of the huge rocks on the hillsides. A bright and fast run was made down-hill from the summit of Glen Ogle to Killin. Here the inhabitants turned out in large numbers to inspect the car, and kindly supplied pails with which to fill the tank with water. The remarks made, questions asked, and the answers given, were somewhat original at times. Whilst the lamps were being lighted, a local cobbler explained to the multitude assembled that the tires were being inflated! Needless to say the tires were solid. The remainder of the road to Kenmore was taken up with admiring Loch Tay, a splendid view of which is obtained from many points of vantage along the north road. The extensive area of hill and lake scenery is perhaps about the best in Scotland."

(To be continued.)

THE pacing machine branch of the motor business is receiving a good deal of attention in America. The Waltham Mfg. Co., of Waltham, Mass., are going into that line of business quite extensively, and a steam motor pacing machine is under construction at the Newton works of the Locomobile Co. of America. The motor, placed between the front and rear seats, will be operated by the rear rider, while the front man looks after the steering of the machine.

## SCOTTISH NOTES.

### "Furious" Driving.

ROBERT GIBSON, a motor-car driver, in the employment of Stirling's Motor-Carriages, Ltd., Hamilton, was charged at Lanark Borough Police-Court last week with driving a motor-carriage in a furious and reckless manner. Accused, who had driven from Hamilton to Lanark with a party of five, and was on his return journey, pleaded not guilty. He asserted that his speed at the time could not have been more than eight or nine miles per hour, and that he was using his brakes. Notwithstanding the fact that five witnesses, who were in the car, all corroborated the driver's evidence, the presiding magistrate, Provost McLeay, preferred to accept that of Mr. Williamson and his two servants, the witnesses for the prosecution. Mr. Williamson, it appears, had a collie dog, which ran in front of the car and got killed. It is very probable had this not occurred nothing unusual or excessive would have been noticed in the speed of the car; but of course this unfortunate circumstance (which might or might not have occurred even had the car been proceeding at half the speed) was the means of collecting a crowd, with the usual result. During the hearing of the case the magistrate, Provost McLeay, adopted the extraordinary proceeding of inviting the chief witness for the prosecution to sit beside him.

### Motor-Cars in Elections.

BUSINESS took me into a Scottish town this week where an election was going on, and I was struck by seeing a horseless carriage making a very good show in the sandwich board line. The car had an ordinary lorry body, on each corner of which a pole about four feet high had been erected. Stretched tightly from pole to pole was white canvas on which was printed the magic words, "Vote for —," etc. The car appeared to be plying about the streets of the ward in which the election was taking place nearly the whole day, and needless to say made a capital running advertisement. The idea was a novel one, and excited a good deal of interest.

### A "Lifu" Steam Bus in Edinburgh.

THE Edinburgh Autocar Company are forging ahead. Not content with their already extensive fleet (if one may use the word) of Daimler wagonettes, they have just added one of the well-known Lifu steam motor vehicles. It is a handsome carriage of the wagonette type, and is capable of accommodating about twelve to fourteen passengers. This is a very useful size for companies which go in for hiring, and the fact should be borne in mind by manufacturers. The great objection made at present by job and post masters who look favourably on the horseless carriage is that the average car costs so much money and carries so few people. There is a lot of truth in the contention, for a brake or chars-a-banc with horses to pull it may be purchased for about £50, but almost another cypher has to be added to this sum before anything approaching this in carrying capacity can be purchased in the shape of a motor-car.

### A Falkirk Flare.

A FIRE, which might have proved a very serious affair, occurred in the depot at Falkirk of the Falkirk District Motor Co., Ltd., last week. It appears that one of the car attendants, whose duty it was to refill the petrol tanks at night, was so careless as to use a lighted candle to show him his way about. He had placed a candle on the splash board over the front wheel of a Stirling-Daimler wagonette, and not more than two feet from the petrol tank

of the car. He then calmly proceeded to recharge the tank, and had just succeeded in doing so when in rising from his stooping position he struck the seat rail and slightly jerked the car and upset the naked candle. There was a huge flare up in a moment and it looked as if the whole fleet of thirteen cars was doomed. Another assistant who was in the place at the time, observed that the stopper of the tank was off, and fortunately succeeded in screwing it on, although he was severely scorched in doing so. But for his presence of mind the damage would have been serious. As it was, the woodwork of three cars was partially destroyed. It is hardly conceivable that any sane individual would use a naked light when so employed, especially when he was aware of the inflammable nature of the oil he was handling, as this man must have been, having been several months in the place. I know of several car depots where many thousands of gallons of motor-car spirit have been handled, and not the slightest accident has occurred at any time; and none need ever occur if ordinary care is exercised when the tanks are being refilled.

"BROWN HEATHER."

## MODERN STEAM WAGONS.

THIS was the title of a paper read by Mr. George A. Burls, A.M.Inst.C.E., at a meeting of the Civil and Mechanical Engineers' Society, at Westminster last week. Referring to the Locomotives on Highways Act, 1896, he said that a very strong consensus of opinion at present existed among engineers as to the undesirability of laying down any fixed tare limit. The reason adduced for the imposition of the present three-ton limit was that many small bridges on country roads were not strong enough to withstand the transit of a heavy automobile. The remedy, however, was clearly to have those bridges strengthened to accommodate the traffic called for by the requirements of the age. Again, it was very generally agreed that the damage to the road surface was very much less than that caused by the horses' hoofs, some going even so far as to maintain that the broad, smooth tire of the heavy automobile actually improved the road surface. Experience gained since 1896 had shown that with the existing three-ton tare limit, not more than, at the very most, four tons of useful load could be taken on one vehicle. It was true that the law permitted a second vehicle to be hauled, the joint tare of motor and trailer not exceeding four tons, and that it was thus commercially practicable to deal with as much as six tons of useful load; but such heavy-load "steamobiles" could only be built within the three-ton tare limit with the very greatest difficulty.

A large demand existed for the transport of loads of six to eight tons on one vehicle, and this would be immediately met with the making of the much-needed amendment. With regard to the use of a trailer, the cases in which it might be usefully employed were not so numerous as might have been supposed. The manœuvring powers of the "steamobile" were much diminished when hauling another vehicle, and this was a serious objection to the latter in cases in which the vehicle is required to run backwards through tortuous lanes, and in cramped yards and wharves, for the purposes of loading or discharging.

Under the head of "Total Cost of Running," Mr. Burls remarked that in the present state of the "steamobile" industry, it was safe to say that the inclusive cost of running, after making liberal allowances under each of the above heads, did not exceed 2½d. per net ton-mile, and that with coal or coke the fuel cost in many cases was as low as ½d.; with oil fuel the cost might amount to 1d. or more; the superior cleanliness, and possibility of automatic firing with oil outweighs, however, in certain cases, the disadvantage of greater expense. The author supplemented his remarks with the result of a diarial account of the running of a steam-wagon during a year. The total cost of running per working day comes out at £1 8s. 5d., and the total cost per net-ton mile at 3½ pence. The owners of this "steamobile" consider that it easily replaces three of their two-horse wagons; that is, six horses, three wagons, three drivers, and three lads.

The author subsequently proceeded to describe the general arrangement and details of mechanism of a number of steam vehicles, illustrated by large wall diagrams, drawing special attention to the Thornycroft standard three-ton wagon. The paper concluded with an expression of confidence in the future of the automobile movement, not only for purposes of pleasure and the carriage of light loads, but also, and especially, for the transport of large quantities of goods and materials over considerable distances with great economy and advantage.

THE Lancaster and Morecambe Motor-Car Co., Ltd., Lancaster, is being voluntarily wound up.

MESSRS. L. PERRIN & Co. is the style of a new firm which has just been established at 12 Rue Mouton-Duouet, Paris, to deal in motor-car and cycle accessories of all kinds. The firm has sent us an abridged list of their specialities, which appears to comprise everything, from a sparking plug to a chauffeur's leather suit.

## THE LIVERPOOL SELF-PROPELLED TRAFFIC ASSOCIATION.

A MEETING of the Council of the Self-Propelled Traffic Association took place on Monday evening, Mr. A. L. Jones, J.P., Senior Vice-President, in the chair. There were also present Messrs. H. H. West, S. B. Cottrell, A. Musker, W. J. Davey, J. Walwyn White, Professor H. S. Hele-Shaw (Vice-President), Mr. E. Shrapnell Smith (Hon. Secretary), and Messrs. A. F. Warr, M.P., and C. M'Arthur, M.P. Letters of apology were received from Mr. John A. Brodie (City Engineer), Mr. Anthony G. Lyster (Engineer-in-Chief Mersey Docks and Harbour Board), and Mr. F. C. Danson (President Liverpool Chamber of Commerce).

It was explained that the object of the meeting was to inform the Parliamentary representatives present of the proposal to have the law altered with regard to the regulation of motor traffic on highways, so that a wagon of four tons weight (unloaded) might be allowed for goods traffic instead of three-ton vehicles.

The Chairman said the limit of three tons retarded the extension of this traffic, and it was important that the proposed extension should be granted. Owing to the need of using fine material, three-ton wagons were expensive, and it was thus more difficult to provide a wagon of commercial value. They were perfectly certain to get such a wagon, the advent of which would confer one of the greatest possible benefits on the community, particularly to a port like Liverpool. The cost of working a motor wagon compared with a horse wagon was about half, and the work would be much more expeditiously done. They could work a motor wagon within an area of fifteen or sixteen miles around Liverpool, and this it would be readily seen would open up the suburbs to the manufacturers and others, and thereby greatly increase trade.

Professor Hele-Shaw said it was admitted that it was quite possible to construct a motor-vehicle under the present limitations to carry, say, four tons safely and satisfactorily, but after their experience of the recent trials they could not admit that at present it seemed possible to construct, upon a commercial basis, vehicles to carry seven, eight, to ten tons, which they were told they would require for the trade of this port. There were two reasons. One was the cost of construction, which would be very great. For instance, one vehicle at the trials had a quantity of aluminium in its construction, and this was an expensive metal, so that in these circumstances the first cost would be greatly increased, and the question of deterioration and repairs would become more serious. The present law seemed to defeat its own object—it placed no restriction on the total load carried. It required a four-inch tire. They were quite prepared to arrange for tires very much wider, and it would be a much more scientific and practical solution, if necessary, to limit the total load carried per inch width of tire. They were quite prepared to fall in with any regulations which embraced this principle of wide tires for heavy loads. From their recent experience it was possible to conceive of a vehicle which would take goods down hill, deposit them, and find it unable to mount the hill again light, so as to be compelled to load up again to return. Some vehicles at their trials fulfilled satisfactorily all the conditions with loads which were unable to climb a hill when light. This was an anomaly. A year or two ago they could not have said this or spoken with such confidence, but their trials, which were regarded as sound, trustworthy, and classical, made it possible to say with certainty that data were now forthcoming which would support these views.

Mr. West said that what they wanted was not to have a limit—or to have a higher limit—for the tare weight of the vehicle. Four tons had been suggested—he would suggest five—or no limit at all. The Local Government Board would still have the power to prevent vehicles too heavily loaded from using bridges, etc., where there might be any danger. The four-inch tire was already exceeded, and would be exceeded still more, and this would mean a heavier unloaded vehicle.

The Chairman said it would perhaps be better to ask for an increase of one ton in the tare this time. This, he understood, would enable them to make a wagon that would be commercially successful. He did not see why the tare should be restricted in any way. The total load might be limited.

Mr. Warr, M.P., said the subject had been clearly brought before them, and he was sure it would be his wish and that of his colleagues to support any proposal which experience might have shown to be necessary for the purpose of the development of this new means of traffic. If it could be shown, as would appear by the representations that had been made by previous speakers, that the proposal to raise the maximum tare from three to four tons unladen would not lead to any public danger or any inconvenience which would outweigh the advantages of it, they would give the measure their cordial support. When the present measure was first introduced into Parliament the maximum weight of an unladen vehicle was put down at only two tons, but after representations had been made to the Local Government Board, an amendment placing it at four tons was agreed to. He did not remember how the present weight of three tons had been finally decided upon. With regard to the remarks of the Chairman and Mr. West regarding the limit of the total load, that matter had cropped up when the present measure was going through Parliament, and it was found that there were practical difficulties in the way of adopting such a limit, inasmuch as it would be necessary to have weighing machines and inspectors in different parts of the country. These were difficulties that might be only apparent, and might be swept away. He was glad it could be shown that the alteration in the present law on the lines suggested was desirable. But he would suggest that it would be increasingly difficult to

make progress with Bills introduced by private members, and that the Government should be approached.

Mr. M'Arthur, M.P., endorsed all that Mr. Warr had said. He would be glad to assist in any way that would make the use of motor-carriages more generally adapted to heavy traffic. He had always looked upon the present Locomotives (Highways) Act as a sort of tentative step—an experimental measure. He thought, it now having been demonstrated that the Act was useful to an extent, and that further powers were needed for the purpose of adapting these carriages to heavy traffic, the House of Commons would view very favourably such a proposal as that suggested, especially if it emanated from the Government. There were two points they would have to be fortified upon; the first was whether the extra ton tare would enable the wagon to carry an amount of traffic necessary to make a motor-vehicle a commercial success.

Professor Hele-Shaw said that was the opinion of engineers present.

Mr. Musker said the increase to four tons would be a decided advantage.

Mr. West suggested there would be no harm in asking for the increase to five tons.

The Chairman said it might be unwise to ask for too much.

Mr. Musker did not think it necessary to have the tare increased beyond four tons.

Professor Hele-Shaw said they wished it to be known that the Association were going solid for four tons, and were confident that that would be an advantage.

Mr. M'Arthur said he might take it then that a vehicle of this weight would be commercially successful. The other point was with regard to the danger to roads, bridges, etc. Parliament would need to be satisfied on that point, but he had no doubt the Association would be able to give satisfactory evidence with regard to this aspect of the case.

A discussion arose as to the desirability of asking for the limit to be placed only on the total load. Mr. Warr pointed out that there were difficulties in the way of adopting such a suggestion.

Professor Hele-Shaw pointed out that at present the maker might build a wagon not to exceed the maximum tare which would carry fifteen tons, and this would be more harmful than if the weight carried was better distributed on a vehicle of greater tare.

In reply to the Chairman, Mr. Warr suggested that the best means of bringing their views before the Government would be to appoint a deputation to wait upon the President of the Local Government Board.

The honorary secretary (Mr. Shrapnell Smith) said that a conference of societies interested in motor-vehicles would be held in London on the 15th inst., at which the question of appointing a deputation would be discussed, and a decision would probably be arrived at to approach the Local Government Board. They had had a private intimation that the President viewed these proposals not unfavourably. He hoped Messrs. Warr and M'Arthur would make it convenient to be present on that occasion. Both Mr. Warr and Mr. M'Arthur promised to attend the meeting.

THE death is announced of Alderman Bell, one of the directors of the Sunderland Motor-Car Co.

MR. W. BECKET HILL has been elected a member of the council of the Liverpool Self-Propelled Traffic Association.

A NEW firm to take up the construction of small petrol motors and also motor-cycles is Messrs. Watson and Dickenson, Falkner Street, Liverpool.

THE directors of the Monopole Cycle Co., Ltd., Coventry, passed a resolution at their last meeting in favour of going in extensively for motor-car manufacturing.

MR. H. LUPTON, surgeon, Stratford-on-Avon, was summoned on Monday for driving a motor-car at Clifford Chambers without a light on October 6th. Defendant, who did not appear, was fined 20s. and 10s. 6d. costs.

THE State Department at Washington is in receipt of a communication from the U.S. Consul at Birmingham, giving favourable testimony to the economy of motor-wagons, as demonstrated by the recent heavy motor-vehicle trials in England.

MESSRS. HEWETSON have sent us an account of an accident to a Benz car which occurred recently at Frankfort, Germany. Although the car was completely overturned, the motor and mechanism was found to be uninjured, and after a short delay was driven home by its owner.

WHITFIELD & HOWE, LIMITED, has been registered, with a capital of £12,000, to acquire the business carried on at Carlisle as Whitfield & Son and William Howe & Sons, and to carry on the business of manufacturers of harness and saddlery, wheelwrights, motor-car, cycle and coach builders, etc.

## FRIGHTENED BY A MOTOR-CAR.

—8—

AT the Henley County-Court last week the case of *Steward v. Day* came on for hearing. This was a claim by Captain Steward, of Orchard Dene, near Henley, for the sum of £47 in respect to damages sustained by him in consequence of his horse being frightened by a motor-car, the property of, and driven by, Mr. Edward Irvine Day, medical practitioner, of Nettlebed, on July 8th. Messrs. Kent and Rowsell, barristers, instructed by Messrs. Mercer, Oldham, and Blaker, Henley, appeared for the plaintiff, and Mr. Staplee Firth, solicitor, for the defendant. Evidence was given on both sides, and the Automobile Club has kindly furnished us with a report of the summing-up of his Honour Sir A. G. Marten, from which we take the following:—

"In this case Mr. John Henry Steward, of Orchard Dene, Bix, near Henley, sues Mr. Edward Irvine Day, of Nettlebed, near Henley. The claim is for £47 for damages caused by the defendant on July 8th, 1899, using on the highway known as the Fair Mile at Henley-on-Thames a light locomotive which was so constructed or used as to be a nuisance, whereby the plaintiff's horse was caused to take fright, causing damage and loss to the plaintiff to the extent of £47. Alternatively for damages caused by the negligence of the defendant in negligently driving the said light locomotive at the time and place aforesaid, whereby the plaintiff's horse was caused to take fright, causing loss and damage to the plaintiff to the extent of £47; and the details are given of the £47. And by the further particulars it is stated: 'The accident took place near Oxford Villas, on the Fair Mile, Henley-on-Thames, between four and five o'clock in the afternoon of July 8th, 1899.'

"The depreciation in value of the horse is due to its no longer being capable of being warranted as quiet, and to its frontal bone having been fractured, and to other damage. As to damage to cart: both shafts broken, dashboard broken to pieces, both wings broken, both wheel springs and axle and cart generally severely strained and damaged. The coachman's name is Thomas Lovegrove, but the plaintiff declines to give the names of the other persons in the cart as they may be his witnesses.

"The plaintiff's case is that Lovegrove, his servant, was driving in a two-wheeled dog-cart from his house to the railway station on the afternoon of July 8th, and that in the trap were a cook seated by the driver, butler sitting behind, and a housemaid also sitting behind. Lovegrove the driver, the cook, and the butler have been called; the housemaid was not called. The cook and butler are servants of Balliol College, Oxford. The crew of Balliol College, Oxford, had hired Captain Steward's house for the Henley Regatta, and the servants were being driven away to the station in the trap, and the horse belonged to Captain Steward. The driver Lovegrove is in his service.

"They say, on the part of the plaintiff, when the mare was about 100 yards from the motor-car she began to prick her ears, and as the motor-car approached she dashed away, and ultimately broke the shafts, threw the people out, and injured herself and the cart, and injured some of the people who were inside, and that the defendant in his motor-car met it, and was going along very fast, and took no notice of it, and that the accident was caused by the motor-car.

"Now the case as put here on the part of the plaintiff is on two grounds. The first is that the motor-car was so conducted, or used, as to be a nuisance. The Act of Parliament allowing what are called 'light locomotives' was passed in the year 1896. Previously, in the year 1861, there was an Act of Parliament which said 'that no form of motor-car should be constructed or used on the roads so as to be a public or private nuisance,' and this Act of 1896 says in Sec. 1 'that the enactments mentioned in the schedule to this Act shall not apply.' In the enactments mentioned in the schedule is the Act of 1861, except among other sections, Sec. 13. Therefore it is quite clear that Sec. 13 is not one of the sections mentioned in the schedule in the Act. But Sec. 1 of the Act of 1896 further says, 'and any other enactment restricting the use of locomotives on highways, and contained in any public, general, or local and personal Act in force at the passing of this Act, shall not apply to any vehicle, etc.'

"It cannot be said that these words exclude the operation of Section 13, but I apprehend that, according to the ordinary law (irrespective of the Acts of Parliament), nobody is allowed to drive or use any vehicle upon the public highway so as to be a public or private nuisance, and the first question to determine is: Was the motor-car being used in such a way as to cause a nuisance? The definition of 'nuisance' is really entirely dependent on questions of fact. It depends on time, circumstances, and a number of other particulars which have to be considered. What amounts to a nuisance at one time may not amount to a nuisance at another time; and what may amount to a nuisance if a certain use of a thing is made at one time may not be a nuisance every time a thing is so used, and you must determine if this motor-car was used as a nuisance.

"You are entitled to consider that an Act of Parliament has authorised the use on roads of light locomotives—that is, motor-cars. No doubt there is great prejudice against motor-cars; on the other hand, the Legislature has legalised the use of motor-cars, and I do not feel sure that after the passing of the Act of 1896 you can look at the question of damage as you would before. Inasmuch as it is known that things such as light locomotives are free to be used on roads, it becomes necessary that the training of horses and animals likely to be frightened by motor-cars should be more complete, so that they may become used to them. Horses can easily be trained so as to be perfectly safe in the presence of motor-cars or traction engines; but it is a question of fact for you to determine, and you must determine it (dealing with the matter in this year 1899), as to what ought to be considered as a nuisance; and you must consider as to whether it would frighten horses of ordinary nerve,

and this must be considered in regard to the education of horses. Of course a totally untrained horse would be frightened at anything, and would be totally unmanageable, while there are other horses which have to be trained to stand fire. Horses have to be trained to traffic in the road, and a horse accustomed to country traffic would be frightened at something which a horse accustomed to London traffic would not notice, because such things are of daily occurrence and are always round them. Horses attached to railway stations stand perfectly still without paying the slightest attention to locomotives, and do not seem to be distracted by them. Therefore, what is a nuisance must be determined according to the circumstances of the case.

"This was a broad high road and proper to be used by motor-cars. It was in the afternoon, and it is impossible for you to say without considering all the facts, that the mere existence of a motor-car on the road, or the mere motion of the motor-car, is a nuisance in itself. Then you must consider whether the circumstances under which it was driven constitute a nuisance; for instance, if driven at a great pace in a narrow road, it might be a nuisance.

"The car, when acquired by Dr. Dav, was a second-hand one, and required frequent repairs and was not efficient, and its existence was a chequered one. On the particular afternoon in question, it was going very slowly, and from the evidence given it certainly was not going more than six or seven miles an hour, and therefore was not driven at a pace which would cause a nuisance on account of the way it was being driven. You must consider this.

"Then as to the noise emitted. It is not stated there was any unusual noise, and there is nothing to show that there is anything grating in the noise, nor any evidence as to any very great noise at all, but that in consequence of the defective state of the machinery the noise was smaller than it otherwise would have been, because the motive-power was defective, and the noise was dependent on the motive-power. The motive-power was weak, and the car was going slowly.

If you come to the conclusion that the motor-car was not a nuisance, or the way in which it was being driven was not a nuisance, you have to consider whether a nuisance was created by its driving. It appears that the motor-car in question is of a common make which is very much in use, and that being so, it is not as if something of an extraordinary kind, or something to which the public were unused or unaccustomed, was brought on the road. According to the evidence, there are thousands in use in the country and many in this district.

"The first question to consider is whether in your opinion the car was being driven in such a way as to occasion a nuisance. If you should be of opinion that it was not, then, whether it was being driven negligently by the defendant. We have heard nothing in the evidence at all to show or upon which you could fully conclude that there was any evidence of negligence on the part of the defendant. The defendant himself was driving, and does know something about motor-cars, and there is nothing to show that he was driving improperly. He seems to have failed to get his sister-in-law to the station in time because the motor-car was bad in its working, and it took him a long time to get back, and it does not appear there was any negligence on his part in what he did.

If you are of opinion that these points are not made out, then your verdict undoubtedly should be for the defendant. Further than this, you have to consider whether it is established to your satisfaction that the accident really did arise from anything connected with the motor-car at all; according to the evidence the mare pricked up her ears about 100 yards away from the motor, and from that time got more and more restive, and almost immediately got out of control of Lovegrove, who never again got her under control, and she broke the shafts and injured herself. Dr. Day says he never saw the accident, in his evidence, and could not account for it. When he was asked how he supposed the accident happened, what he suggested was that before he came up, and while he was 100 yards away, the mare jumped away, got some way actually from the road, and that he was attending only to his motor-car and did not see what occurred. It will be for you to consider whether you are satisfied on the whole, as common-sense men of the world, that the accident really was due to the motor-car; but, in order to find against the defendant, if you are satisfied the accident was occasioned by the motor-car, you must find either that the motor-car was used in such a way as to be a nuisance, or that it was negligently driven.

"If neither of these things occurred, if it was not being driven as a nuisance, or if there was no negligence on the part of the defendant in using it, the accident is one of those things which may occur, but the defendant is not liable for it. With these points before you I leave the matter to your consideration. There is no question as to the damages, and you must consider your verdict for plaintiff or defendant on the facts as I have stated them to you, and if you find for the plaintiff you may find for £47, or any less sum you may think fit."

The jury gave verdict for defendant and stated the motor-car was neither negligent nor a nuisance.

At a meeting of the Institution of Junior Engineers on May 4th, 1900, Mr. Charles H. Rush and Mr. Bertram C. Joy will read a paper on "The Motor-Car Industry, Past and Present."

THE Locomobile Co. of America, of Newtown, Mass., have appointed Mr. E. H. Halsey, of 104 Drayton Gardens, Kensington, W., agent for the Stanley steam cars in the British Isles.

## FURIOUS DRIVING CASES.

At the Lanark Burgh Court last week, Robert Gibson, motor-car driver, 53 Chapel Street, Hamilton, pleaded not guilty to having on Sunday, the 15th ult., on the public road at Steel's Cross, Lanark, driven a motor-carriage in a furious and reckless manner. He was, however, fined £1, with the alternative of ten days' imprisonment.

At the Marylebone Police-Court on Tuesday, Mr. Henry Leitner, 207 Piccadilly, was charged, before Mr. Curtis-Bennett, with furiously driving an electric motor-car at Regent's Park, the rate being nineteen miles an hour. Mr. Leitner had been cautioned a few days before, and he promised not to offend again. Mr. Curtis-Bennett fined him 20s., with 2s. costs.

## A FATAL MOTOR-CAR ACCIDENT.

AN exceedingly distressing accident, which unfortunately resulted fatally, occurred at Kirkhill, Nigg, on Thursday evening, the 2nd inst., whereby Frederick James Lyall, mechanic and motor-car driver, employed by the Caledonian Motor-Car and Cycle Company, Aberdeen, was killed. About three months ago Mr. Fletcher Moss, Fetteresso Castle, hired one of the motor-cars belonging to the Caledonian Company, and Lyall was sent as driver in charge of the car. There was absolutely no mishap of any kind during the period the car was at Fetteresso, and the time of the hire having expired, Lyall was instructed to return to Aberdeen. In the course of the afternoon he left Fetteresso in charge of the carriage, and reached Kirkhill shortly after seven o'clock. There was nobody in the car but the driver, and the actual facts of the accident are shrouded in mystery. It seems, however, that, whilst passing the smithy at Kirkhill, Mr. Gordon Forbes, the blacksmith, observed that the car was going at an unusually fast rate. At the time the road was in pitchy darkness, and rain was falling heavily. Immediately after the car had passed, Mr. Forbes heard a loud crash, and on proceeding to investigate he saw the car lying overturned in the middle of the road with no sign of the driver. Others having heard the collapse of the car ran to the scene, but all were afraid to interfere with the machine, believing that an explosion was imminent. Constable Charles Gauld, whose house stands within a few yards from the spot where the accident occurred, was informed of the circumstances, and at once endeavoured to discover the whereabouts of Lyall. All this time the flames from the motor were enveloping the front portion of the car. As a matter of fact there was no danger from that quarter, but none were acquainted with the mechanical apparatus of the motor, and accordingly held back. The constable, however, very pluckily proceeded to the car and, with the help of two farm servants, managed to raise the front part, and there immediately beneath the seat lay the body of Lyall, crushed and bruised. There was no sign of life, but the body was carried to Constable Gauld's house, and a message despatched to Dr. Ogilvie for assistance. When the doctor arrived he certified deceased had sustained a severe fracture of the skull, and that death had been instantaneous. From the marks of the carriage wheels it appeared that in the darkness Lyall had steered the machine off the road and over the deep gutter to the pavement. With the view of getting it under control he had apparently swerved the vehicle round, clamping the brakes hard on, with the result that the sudden stoppage upset the balance, and the car turned upside down. Lyall, who was only 28 years of age, was a native of Montrose, and had been in the employment of the Caledonian Company for about five months. His skill and experience of motor-cars had gained him rapid promotion, and indeed he was considered one of the cleverest mechanics in the company's service. He leaves a widow and two children.

The accident was referred to on Friday last at the annual meeting of the Caledonian Motor-Car and Cycle Company, when Bailie Bain, the chairman, made a feeling reference to the fatality. They had the utmost sympathy with the widow and children, for whom, while not admitting liability, they would do something. They could not understand, however, why the driver selected a road on which there was a dangerous decline, and why he was so late in getting near Aberdeen. The damage of the coachwork of the car could be repaired for £30 or £35.

THE Swift Cycle Co., Ltd., of Coventry, are introducing a new motor-tricycle to be known as the "Swift." The makers state that the machine has been designed chiefly with a view to ease of repair in case of accident, every part being easily accessible and detachable with a minimum amount of trouble. The whole axle can be taken out of the frame without the slightest interference with the adjustment of any of the bearings, and replaced again simply by removing the caps of the hanger brackets. Another Midland concern to take up the construction of motor-tricycles is Osmonds, Ltd., Birmingham. In the new machine Mr. F. J. Osmond, the designer, has aimed at extreme simplicity in the working parts. We also understand that Mr. Osmond has decided to adopt for the present the Gaillardet motor, illustrated and described in *The Motor-Car Journal* for July 7th last.

## COMMENTS.

how many reached there by road on the first occasion has never been really known. At all events the impetus to the industry was not so great as had been anticipated, although it may from a company promoter's point of view have answered its purposes. This year the Motor-Car Club, an organization which was created, we believe, for the purpose of carrying out the initial running of motor-cars on the roads of Great Britain, called together motorists from far and near to join in their efforts to show to the world that a substantial progress has been made in automobiles. Over one hundred owners with their cars answered this appeal, and at the appointed hour made a start for Brighton. For the first fourteen miles the route lay through heavy traffic and over greasy tram-lines, but after leaving Croydon the roads in some parts were still found heavy. But with these disadvantages we have to chronicle the fact that more than ninety per cent. of the vehicles (cars and cycles) reached Brighton without mishap or incident. Such a feat is an astonishing one, bearing in mind the comparatively few months since the legislation of the automobile; and those who dare state that the industry has not made progress must be actuated by motive other than respect for truth. The majority of the cars in use on Monday were of British construction, and, as a speaker said at the banquet in the evening, these were among the best on the road.

### The Motor-Car Club Banquet.

MONDAY'S dinner of the Motor-Car Club was a delightful function, everything—including the abnormal amount of smoke resulting from the photographer's enterprise—passing off satisfactorily. Hearty felicitations were offered by the guests to the trio (Messrs. Baily, Smith, and Wridgway) responsible for the success attained, and warm were the greetings extended to the former when he rose to respond to the toast of "The Club." Most of the speeches were commendably brief, and the universal feeling of concern in the Transvaal was indicated when Colonel Gourand referred to the British forces in South Africa. The fact that an American officer responded for the British "United Forces" was an agreeable innovation, and the Colonel won the loudest applause when he declared that the greatest reserve force of Great Britain was the United States. To characterise the speeches would be an invidious task, but those who were absent may be glad to know that Mr. Gretton made a speech of substantial quality well befitting the industry for which he

responded; that Mr. Holroyd Smith left the technique of engineering practice for the improvisation of rhyme, inspired thereto by the presence of the ladies, and, possibly, the speech that had immediately preceded. That was by Mr. Towner, who, in replying to the toast of "The Press" (Mr. C. Cordingley, of *The Motor-Car Journal*, had responded for automobile journalism) waxed eloquent on the influence of the motor-car on matrimonial bliss and its greater family convenience as compared with those machines that only provided accommodation for the heads of families, wholly ignoring the olive branches of humanity. During the evening a graceful ice structure, illuminated by the electric light, was wheeled into the room; it was greeted with applause when it was seen to be surmounted by two or three motor-cars of small size but excellent design—a development in mechanical toys that will probably be in great demand during the coming festive season. Dinner over, a goodly contingent of the guests hurried away to the station, where a special midnight train was waiting to convey them home by the commonplace method of locomotion on a railroad track. And at Victoria enthusiastic automobilists did not despise the most commonplace hansoms, and looked not with disgust upon the "growlers" that earlier travellers had ignored. Such is the force of circumstances!

### An Intelligence Department Wanted.

SOME eminent politicians have confessed that they do not read the papers, but surely "comparatively young officials" of the Brighton Corporation know better. One can only assume that the columns of war news have prevented their glancing at home events; or surely they would have known that a great assemblage of motor-vehicles was about to take place in bracing Brighton. Anyhow, some of the roads were up—a fact which enabled the cars to demonstrate their capacity over rough ground, and will probably be instanced by some of the advocates of March or May as the month of the Automobile Club's trials. Sir John Blaker was rather severe upon the local authorities of his town for their want of foresight, and it will probably not occur again in enlightened and progressive Brighton. But the need for an Intelligence Department is urgent in many other localities.

### Automobiles and Warfare.

At the dinner men's minds were frequently recalled to events proceeding in the Transvaal, the speech of Colonel Gourand dealing with the subject with some fulness, and Sir John Blaker suggested that motor-vehicles would doubtless be widely employed in the future. Sir Somers Vine went further, and expressed something akin to astonishment at their non-employment in South Africa in the present crisis. While enthusiasts may regard the War Office as the reverse of enterprising in this direction, and while we have previously shown how facilities for experimental work at Aldershot have not been given, we are inclined to believe that they are just as well at home just now. The circumstances of their employment in South Africa would be so wholly

different to those that obtain in this country in ordinary times that it is possible many would refuse to stand the test; and such would be disastrous to the Army and a retardation as to their progress for commercial and pleasure purposes. When we have demonstrated their commercial possibility to a much greater extent than now, and when vehicles of proper design have been constructed, it will be early enough to venture automobiles on hazardous expeditions.

#### An Expert's Opinion.

THE subject was again mentioned at the Automobile Club's dinner on Tuesday, and in response to the suggestion of Mr. Roger Wallace, Major Holden, the head of the gun testing department at Woolwich, held out the hope that the automobile would ultimately prove of service in warfare. The War Office, while apparently not experimenting on their own account, is watching the trials and tests taking place in various parts, with a view to their adoption when such seems feasible. But, of course, they will have to be absolutely reliable to secure the patronage of the War Office.

#### The Automobile Club Dinner.

As will be seen from the full report of the third annual dinner of the Automobile Club appearing on another page, a most enjoyable evening was spent by those who were present at the Hotel Metropole in London on Tuesday. Mr. Roger Wallace's capacities as chairman are well-known, and the speech of Mr. Shaw-Lefevre was that of a

BARNTON HOTEL, NEAR EDINBURGH—A WELL-KNOWN SCOTTISH AUTOMOBILE RENDEZVOUS.

man who is sincerely interested in the subject. In a very neat and happy way he showed how Mr. Chaplin had more chance of success with the Light Locomotives Bill than he had when president of the Local Government Board, for a man who was so identified with rural life and so known as a lover of horseflesh as the Lincolnshire squire who presides over that department could not possibly be suspected of having designs against horses. Lord Ampthill combined dignity of delivery with dry humour in most effective style, and the comparison between the House of Lords and automobilism was witty and original—qualities which are rare enough at such functions to be well appreciated when found in combination. Mr. H. W. Lucy responded for the Press in a style that revealed the genial "Toby" of *Punch*, and his picture of the policeman who was out of sight before he and his fellow passengers could alight from the automobile was one of the "hits" of the evening. Evidently the Automobile Club is on a fair way to realise the high aims of its committee, whose zeal for the movement is calculated to bring the most influential people in the land into its ranks.

#### Training the Horses.

A FEATURE of more than passing notice of the run to Brighton on Monday was the advantage taken of the same by not a few owners of horses to give their animals an automobile lesson. "Phänomen," in his account of the run on another page, points out that on nearing Redhill his party met a groom with a high-spirited horse who asked the driver of the car if he would mind slowing down a little to enable him to give a lesson to the horse. Naturally compliance was given to the request, and for nearly half a mile the horse was made to run alongside and at the immediate rear of the automobile. In the intervals of panting for breath the groom stated that he had already given the animal a few lessons, which were beginning to have effect. Judging from the behaviour of the horse in question it would need little, if any, more training to be trusted in company with motor-cars. It was only last week we suggested that horse owners in various parts of the country would find time profitably spent in giving a motor-car lesson to their horses, and it is gratifying to see this suggestion being acted upon. If the example was generally followed—and, seeing that motor-vehicles have a legal right to use the roads, it should be—we shall soon read less of horses bolting on the appearance of an automobile.

#### A New Car.

IN the list of entries for the run to Brighton, the name of Mr. M. Holroyd Smith of Westminster was given in connection with a Smith 4-h.p. car. Mr. Smith put in an appearance on Monday morning at Whitehall, but not so the car. In the course of a few minutes conversation Mr. Smith informed us that he had been unable to complete his new car in time for the run. We understand it comprises several new features, of which we are promised particulars at a later date.

#### The Outlook for the Industry.

THE year 1896 is known as the cycle boom. We rather fancy that the year 1900 will be known as the year in which motor-cars first appeared on the roads in numbers. The manufacturers already in existence, and they are many, have now their factories in thorough working order, and they are capable of turning out a large number of cars per week. Many new firms are laying down plant, and are making patterns with a view of putting cars on the market. The securing of an agency for one of these new firms is an object of competition amongst people who desire to enter the movement, and in more than one instance the whole output of motor-cars have been bid for. As to the future of the motor industry there is no uncertainty, and all who are concerned in its development are not only satisfied with what has been done in the past but are convinced of the greater prosperity of the industry in the future.

#### The Proposed Scottish Automobile Club.

OUR correspondent, "Brown Heather," writes:—"I would remind all Scottish chauffeurs of the meeting to be held in the Royal Hotel, Edinburgh, on Friday, December 1st, in connection with the proposed Scottish branch of the Automobile Club of Great Britain. Whether its headquarters, if it is decided to form a club, will be in Glasgow or Edinburgh remains to be seen, but I rather fancy the capital town, where motors have undoubtedly 'caught on,' more than in the 'second city,' will have that honour. Glasgow is certainly working away experimenting, and has been for some years, in motor-car matters, but there is more external evidence of the horseless carriage in Edinburgh, which is now almost as familiar an object as the tramway car. To a Glasgow gentleman, however (Mr. Smith, of Messrs. Mitchell & Smith, C.A.), belongs the credit of having

brought the matter to its present stage, and whether the branch club is formed in Glasgow or Edinburgh, Mr. Smith deserves the thanks of all who will benefit from its inception."

### The Scotch Demonstration Postponed.

ON account of the very unsettled state of the weather which would really make or mar the pleasures of a motor-car demonstration such as was proposed in Scotland in celebration of the advent of the motor-car on British roads, it was decided to postpone the same to a future date, and from what we hear the demonstration when it does come off will have added interest in the form of a few cars which have not yet seen the light.

### A Yorkshire Company.

THE Yorkshire Motor-Car Company, Limited, of Bradford, and Messrs. Brown & Buckton, motor and cycle engineers, of Halifax and Hipperholme, are uniting their concerns in the Yorkshire Motor-Car Manufacturing Company, Limited, with a share capital of £50,000, subscriptions for £25,000 of which are now being invited. The first-named company has attained prominence in connection with the Jackson doctor's car, noticed in our issue of June 16th last, and which was shown at the Automobile Club's Exhibition this year. The other firm in the amalgamation makes a speciality of light oil motors, and has been established a decade. The formation of a company has been deemed advisable to meet the great demand on both concerns, and larger premises will be taken at Bradford, where the manufacture of complete cars for passenger traffic and for goods haulage will be undertaken. Messrs. Brown and Buckton will become directors of the Yorkshire Motor-Car Manufacturing Company, Limited, and Mr. J. E. Tuke, the managing director of the Yorkshire Motor-Car Company, Limited, will occupy a similar position in the reconstructed business. These, with Messrs. A. H. Hutton, T. Craig, J. Mollett, and L. A. Skelton, complete the directorate.

### A Comparison of Accidents.

*Le Velo* continues its excellent work of issuing a monthly table showing the total number of automobile accidents in France as compared with those resulting from the use of the noble horse, and these comparisons of figures never fail to emphasise the increase of safety which is secured by employing the automobile. The number of motor-cars in daily use throughout France is increasing by leaps and bounds, while the record of accidents shows rather a tendency to diminution. Many of these mishaps, too, result from the eccentricities of the novice, who, in the exuberance of his spirits at having a real live motor-car of his own, endeavours to drive at a speed of twenty miles an hour before he has mastered the art of steering at eight. If only a number of driving schools were instituted throughout the country, where all would-be chauffeurs could secure a thorough course of instruction at a moderate fee, the few misadventures which at present occur from time to time would practically disappear and a clean sheet might also be shown side by side with the appalling list of horse accidents. During the month of October only 23 accidents have been caused by automobiles, and not a single fatality can be charged to the new means of locomotion. The accidents recorded have resulted in 23 persons sustaining injuries, but in two instances only were the victims at all seriously hurt. During the same period the "hay motor" has given rise to no less than 906 accidents! As the result of these accidents, 92 persons have been killed and 814 wounded, a truly appalling chronicle, and yet the automobile is an all-destroying machine in the eyes of a certain section of the public and the press! What do they want?

### Motor-Cars at Aberdare.

THE much-discussed question of granting licences to the local motor-car company was again the subject of argument at the Aberdare District Council meeting on Friday last week. Strong opposition was offered by the break owners, and, as a result of public meetings in various wards, the application had been twice adjourned. It was eventually decided by an almost unanimous vote to grant the required permission.

### The Werner Motor-Bicycle.

ALTHOUGH the Werner motor-bicycle is not by any means new to automobilists, it has lately undergone certain modifications and improvements, and an effort is again being made to popularise the machine in this country. The "motocyclette," as it is called in France, is made by Messrs. Werner Frères & Co., of Paris, and at the depot of [the

Motor Manufacturing Co., Ltd., the sole selling agents in this country, we were shown the other day an example of the latest type. In the earlier machines the motor was of only  $\frac{3}{4}$  h.p., and had lamp ignition; the new type has an engine of 1 h.p. and electrical ignition. The motor is attached to the head of the machine, which, for purposes of strength and increased freedom from breakage, is provided with duplex front forks. The power of the engine is transmitted to the front wheel by means of a small belt working on grooved pulleys. The petrol tank and carburettor, which is attached to the top tube of the frame, has a capacity of about two litres, or sufficient for a run of seventy-five miles, while the battery capacity will, we are informed, suffice for a run of 1,200 miles. The pedals, which work in conjunction with a "free-wheel" clutch, are only used at starting or in mounting very steep hills, the motor being claimed to be sufficiently powerful to drive the machine unaided up ordinary hills, and to give a speed of from twenty-five to thirty-five kilometres per hour on ordinary roads. The motor, which weighs about 22 lb., has the valves and explosion chamber arranged in such a way that the latter can be quickly detached for cleaning or other purposes. A powerful band-brake acting on the rear-wheel hub, and operated from the handle-bar in the usual way, is provided. In case of accident to the motor, or of running short of motor-car spirit, the machine can readily be pedalled home, all connection between the motor and the machine

being broken by simply removing the belt. The machine was shown to us by Mr. Leonard, who has ridden a "Werner" for over 5,000 miles, and who successfully did the journey to Brighton on Monday last; and, asked as to side slip, he stated that he had used the motor-bicycle in all weathers, and found no more difficulty on this account than with an ordinary chain-driven bicycle. The machine weighs complete about 65 lb.; it is being made in two sizes—to suit average-sized and tall riders.

#### The Automobile Club Badge.

THE committee of the Automobile Club has just adopted a badge for its members. The badge is formed of a ring of blue enamel with the name of the Club in gold letters. In the centre there is a small perforated representation of Hancock's "Infant," which was constructed about 1830. The connection of this country with the early days of automobilism is thus indicated in the badge of the British Club. The badge may be obtained in the form of a brooch, a pendant, or with a button at the back to enable it to be worn in a button-hole. It is being made in gold, silver-gilt and enamel, and also in bronze. Certain regulations regarding the use of the badge have been decided upon, and in accepting badges members will be required to sign an undertaking to abide by these regulations.

#### A Reminiscence of the Richmond Show.

A REMINISCENCE of the Automobile Show at Richmond in June last comes to hand this week in the shape of the report of the judges. The report itself extends to about eight pages, and concludes with the remarks that "the judges are of opinion that the line separating some vehicles from others in merit may not be so broad as is suggested by

OUTLINE VIEW OF THE MOTOR VEHICLE CO.'S NEW "NAPIER" CAR.

the difference between gold and silver medals, and that at another Exhibition it might be well to have gold medals of first and second class." Part II. is devoted to the awards, while Part III. gives the results of the hill climbing and distance trials organized in connection with the Exhibition. There were, of course, dealt with in these columns at the time, but the report just published will be useful as a work of reference, full particulars being given of the vehicles which took part in the trials.

#### The Automobile in Fiction.

THERE have been many fictions about the automobile, but the automobile has not yet figured in fiction to any extent. Doubtless it will some day. In fact, we hear of a novel now in preparation in which a motor-car is to be the central point of interest, while, it maybe, some of the lady novelists who delight in motoring may make incidental mention of a motor-tricycle or heavy vehicle in their shorter stories. An attempt has been made in this month's *Macmillan's Magazine*, in which the tale of an "Automotor-Omnibus" extends over ten pages. It is a long story (seeing

how few are the incidents related), in which a lame duck is foully murdered and a baker's horse frightened into the ditch. We are treated to a few comments of the familiar character from rustic observers, and finally told that the automotor-omnibus is to be fitted up as a poultry house and utilised about the estate. We are afraid we cannot say the story is a success; still we would not discourage those who utilise the motor-car for purposes of "copy." Since the above was written the Christmas number of the *Harmsworth Magazine* has made its appearance, and a rapid glance over its pages shows it to contain an illustrated story entitled "Man v. Petroleum: a Terrific Race on a French Highway." We have not yet had time to read the story, which, judging from the illustrations, is an account of a race between a motor-car and a bicycle, the final illustration shewing the the automobile in an overturned state of collapse.

#### A "Toward" Heavy Steam Wagon.

WE learn that Messrs. T. Toward and Co., of St. Lawrence Ironworks, Newcastle-on-Tyne, have just completed a heavy steam wagon intended for carting ore from a mine in Yorkshire. It is mounted on a strong steel frame with horn plates (locomotive style). This, in turn, is, in the case of the hind end, suspended by spiral springs on axle boxes and a steel shaft, on which the steel road driving wheels are mounted; the fore end is supported on a fore carriage, with laminated springs, and turn plate, on a steel shaft, and steel front wheels with special auxiliary iron tires, the steering being worked by a hand wheel, worm wheel and chains on the traction engine principle. There is a cab or shelter over the driver, and the propelling machinery consists of a pair of compound reversing horizontal engines capable of developing 25 i.h.p. placed directly below the underframe and geared with two speeds (eight and four miles per hour) and differential gear to an intermediate shaft, which in its turn is geared direct with pinions on to an internal spur-wheel on each driving wheel and entirely cased in. This dispenses with the usual chains and sprocket wheels. Steam is supplied at 200 lb. per square inch by one of the firm's high pressure watertube boilers, placed right in front of the driver, as are the manipulating levers and steering gear. The exhaust steam passes through a filter tank, and then exhausts into the chimney; there is no visible steam while running. The wagon, having been loaded with three and a half tons of material, was subjected to a trial a few days ago when steep banks were surmounted with the greatest ease, and the mechanical tipping gear was also tested with satisfactory results. The wagon left Newcastle early on Saturday morning last for Barnard Castle.

#### Steam Motor-Vehicles.

AMERICAN motor-car builders appear to have so far made most progress in the construction of light steam vehicles. These are now being turned out on a commercial scale, and are beginning to make their appearance on the roads all over the United States. The onward march of the steam car is, however, likely to meet with a temporary check in at least one part of that large country, for the commissioners of the District of Columbia have lately decided that a steam engineer's licence is necessary for operating on the streets of Washington automobiles run by steam generated from petroleum spirit or other fuel. The purchaser of a steam-car recently inquired of the commissioners whether a permit would be required before the machine could be placed on the streets. The question was referred to the board which examines stationary engineers and also to the superintendent of streets. Although an examination of the vehicle showed that it was easily operated and did not require a trained engineer to handle it, the recommendations were to the effect that a permit should be secured for its operation, and that the operator should possess a licence as a stationary engineer.

## The Run of the Motor-Car Club.

TUESDAY, the 14th inst., was the fourth anniversary of the day when legislative interference with automobilists in this country was removed and the man with the red flag relegated into the obscurity of tradition. To celebrate the event in appropriate fashion, and to impress the great British public with the fact that motor-cars have come to stay—

or, rather, have, to employ an Irishism, come to go—the Motor-Car Club organized on the previous Monday, the 13th inst., an effective demonstration, and arranged a run to Brighton. The idea of such an annual outing is decidedly commendable—it familiarises the public with motor-vehicles of every description, it educates the horses in the localities through which the cavalcade of motorists pass, and it puts to an actual test the qualities that are claimed for particular vehicles. As a trial of capacity the old coaching road to the seaside metropolis can hardly be excelled, providing a succession of varying gradients, and, by turning a little from the path, those who enjoy landscape by switchback can easily test their cars under most rapidly alternating conditions. Therefore from every point of view the promoters of this perennial parade are to be congratulated on their initiation of a movement which is expanding and extending year by year.

Hitherto the weather has not favoured the Motor-Car Club, but on the present occasion Mr. Baily had not overlooked that point of some importance. As Mr. Gretton observed at the dinner in the evening, the cars are requiring less water, and their passengers certainly had less than has been customary. In place of the boisterous windy storms that threatened the comfort of all and the health of many in 1896, "Motor-Car Day" of 1899 gave us a sample of the English climate in a very agreeable form. Those who had provided themselves with fur garments of strange and Robinson Crusoe-like appearance found them more serviceable as rugs than as wraps, and even the impervious qualities of leather overalls were unnecessary. A bright, cheerful morning was followed by increasing warmth until the sun shone out o'er field and furrow and over horse and motor-car alike. If magistrates have a partiality for equines against automobiles there is the pleasant reflection for those who ride either—and men may do both on separate occasions—that Nature smiles or storms at each alike. Where each has its use Providence has no favourites.

### THE ENSEMBLE.

Official details had been posted to all the owners of motor-cars, carriages, wagonettes, tricycles, quadricycles, and other vehicles who had notified their intention to participate in the run. Punctually at 10 a.m. the *ensemble* was to commence, and an hour later the disappearance of the photographer on the terrace of the National Liberal Club under his black velvet cloth and the sound of the bugle were to signal the advance. All seemed to recognise that "the eyes of the world" were upon them, and punctuality was the general rule, so that within a few minutes after 10 a.m. the whole of the space along one side of Whitehall Place was lined with motor-vehicles. The police had less difficulty in directing drivers to their places than had it been the meet of a coaching club, or if the carriages had been taking guests to the Lord Mayor's banquet. There was no rearing at the recognition of a brother steved in shafts, nor did any car prove fractious or ungovernable. The manners of the machines would have done credit to a young ladies' seminary—so quiet, so demure did they appear standing by the kerb without any of the signs of impatience and

irritation which produced such exaggerated reports of bad temper on the first occasion of these runs. Near the entrance to the Hotel Metropole a portion of the roadway was "up for repairs," a gentle reminder of the obstructive policy which long prevailed in high quarters. Long years ago when mechanical traction was introduced on the turnpike roads in Scotland gangs of coaching men were known to have destroyed by night the path of the steam vehicles that lumbered along. But here was evidence of work by day that might well have been delayed or quickened to have secured a proper surface on such an important occasion. Complaint is probably useless, and it was, of course, nothing more than a curious coincidence that both at the Alpha and Omega of their pilgrimage the votaries of the motor-car should have seen bits of roadway well worth avoiding.

Shortly before ten o'clock a.m. the cars began to arrive, No. 66 being the pioneer, closely followed by Mr. A. F. Mulliner on a Daimler car. Mr. Egerton was the first motor-tricyclist to put in an appearance. For the next hour the scene became increasingly animated, and the crowd swelled into a goodly company, many of the little groups being composed of interested people evidently on the look out for the latest and best types of particular vehicles. It is impossible for us to mention all the many types of cars which lined up at the start of the run. Benz and Daimler cars innumerable were present, while examples of Mors', Panhard's, Marshall's, Canstatt-Daimler's, Princesses, were also to be seen. Of motor-tricycles and quadricycles, the number seemed endless, while the well-known Bollée-voiturette was not conspicuous by its absence. Mr. Billings, of the Endurance Motor Company, Coventry, did not bring one of the "Endurance" cars, but one of Belgian construction known as the Déchamps. This vehicle was new to many of the spectators, but as it was illustrated and described in our issue of August 25th last it is not necessary for us to refer to it at length. The huge twenty-seated charr-a-banc of the British Motor-Coupé Co. attracted considerable attention, as also did the new electrical vehicle driven by Mr. Leitner, of the Electrical Undertakings, Ltd. This car, which had a peculiar torpedo-shaped front, did not—at least, so far as we could learn—take part in the run to Brighton. The Patents Trading Syndicate, Ltd., were present at the start with a new two-seated voiturette constructed under the Heinle-Wegelin patents. The motor is a two-cylinder one of  $3\frac{1}{2}$  h.p., partially air and partially water-cooled; it is fixed under the seat and started by means of a lever and a ratchet quadrant from the seat. The ignition is electric, the spark being obtained from an electro-magnet arrangement. Two brakes are available: a band brake on the driving shaft and shoe brakes operating on the rear wheels, which are 32 in. diameter. The car measures over all 6 ft. by 3 ft. 6 in. by 4 ft., and weighs 6 cwt. Three speeds are provided, the maximum speed being thirty miles per hour. We were unable to ascertain if the car started for Brighton, or if it succeeded in making the journey. A Heinle-Wegelin tricycle was, however, we afterwards learned, one of the early arrivals at the Hotel Metropole, Brighton. The Hon. C. S. Rolls turned up on a new Peugeot two-seated voiturette, while Mr. Moffatt Ford came on a somewhat larger car of the same company's construction. An excellent opportunity was afforded the public of gauging the comprehensive nature of the term automobile by the presence of a Werner motor-bicycle and Messrs. Johnson and Phillips' "Lifu" steam wagon, the latter having steam up and carrying a heavy load of electrical plant.

By eleven o'clock quite a hundred cars and motor-cycles had been drawn up in Whitehall Place and overflowed the adjacent thoroughfares. Of the 135 owners who had intimated their intention of taking part 104 actually were present, the absence of the other cars being due to various causes. On the stroke of eleven, Mr. C. Jarrott, accompanied

by Mr. Baily, mounted the pilot car, a Panhard, and the bugle sounded its warning note just after a coach and four had passed with the old fashioned horn tooting away as though it were an expiring institution. The sound was taken up along the line and from many a car the horn blew its peculiar notes until a most discordant chorus of strange sounds was in the air. Then the bugler renewed his efforts, the photographer got ready for work, and away went the pilot along the Embankment. In less than a quarter of an hour Whitehall Place was resuming its normal quietude, the last of the cars had passed the shadow of Big Ben, and the great procession was negotiating the traffic of Westminster Bridge in a way that won the respect of cabbies and 'busmen alike. They no longer jeered, and although a few isolated cases of broad grinning occurred the motor-cars of 1899 were evidently recognised as an integral part of metropolitan street traffic.

## A PLEASANT EXPERIENCE.

By A NOVITIATE.

I AM a novice in automobilism; nay, the veriest tyro. My impressions of motor-cars have been those of the observer from the pavement, and my judgment as to their character has been based on a study of the casualty column of the *Financial News*, which rarely misses the publication of a motor-car accident, and when some eccentric horse grows restless at sight of a mechanically propelled vehicle always denounces the motor-car—as though it was the possessor of the vicious temper. That by way of introduction.

Anxious to obtain more knowledge of the new locomotion—although the idea of steam traffic on common roads preceded the realisation of the railway—and wanting excitement, I sought a seat on one of these vehicles wherefrom to watch the attitude of gee-gees, the astonishment of the public and the behaviour of motor-vehicles in general. Accepting an invitation to occupy the back seat of a dog-cart—No. 66 on the list—I was early in Whitehall Court, and found my vehicle just behind the Pilot. There was an element of safety, I thought, in such a position, for should we break down there were plenty of followers to feel compassion and take us in tow. For I had read many stories of both the petrol and fraternal spirit that makes all motorists kin. We started well and rounded into the embankment with a swerve that reminded me of an Irish jaunting car turning a corner and shooting its passengers into the gutter. But there was this advantage in the present case—that I should have descended in the middle of the road. Fortunately the catastrophe was avoided, and with an easy grace I placed my arm at the back of the seat, very much at my ease. From my rearward position I saw the fine procession of cars turning the Whitehall corner, and coming along into the straight. Interest soon centred in our rivals, for had I not heard of the desperate efforts of motorists to rush ahead of one another, pass over pedestrians, send hansoms into splinters and otherwise carve their way to destruction rather than be left behind? Before we got to Westminster Bridge a fine car of prepossessing appearance—I suppose that term can be applied to such a vehicle—was making the pace and seemed coming down upon us. Rapidly the distance was lessened and then gently swerving it passed alongside and its occupants—Messrs. Edge and Napier, the latter the constructor of its motor—smiled upon us, but without any unnecessary exultation. Our driver was quite composed, and we passed Big Ben when the great finger was pointing to eight minutes past the hour of eleven. On the bridge Mr. W. H. M. Burgess got ahead in a De Dion quadricycle, and a moment later Mr. C. G. Wridgway went to the front. Meanwhile we dodged vans, drays, cabs and barrows with equal success, making a good pace when we got clear of the intricacies of the traffic. At Lambeth Baths we saw but few of our followers; already the procession had lengthened, with great gaps in between the cars, and the next to hail us

was Mr. Hodges, of the London Motor-Van and Wagon Company, who had Mr. W. C. Bersey as a passenger. Then as we hurried past "The Horns" at Kennington Mr. H. W. Egerton whizzed by on his motor-tricycle in good style and in sportive humour. A few yards further came evidence of the commercial value of motor power on highways, for a great van bearing the device "Colman's Starch" was to be descried making its way towards London with no horses. To those of us "in the know," or rather in the cars, there was no mystery about that, but a couple of little dogs were prowling about evidently in search of the heels of the horses. The absence of the driver's whip emboldened them to continue barking and whining with delight.

Although the roads were greasy and we had one or two slight touches of side slip, things had gone well so far. There was practically no vibration. I had not had to stuff my ears with wadding to minimise groaning from the machinery, and no odorous fumes had reached my olfactory nerves. And we were still going forward; the driver, in reply to my interrogations, having no idea of a break-down—just yet. My early fears of trouble were fading almost as quickly as the railings of the suburban villas withdrew in the distance, and a calm courage replaced my previous stubborn determination to hold on whatever was blown off. We did Brixton Hill in easy style, and at half-past eleven were cheered by the boys of a school opposite Streatham Common, whose teachers had brought them out to acquaint them with a method of travelling which will be regarded as quite commonplace by the time they grow moustaches. And so we went on without incident through Norbury, where a motor-cyclist was making an adjustment by the roadside, to Croydon, where Mr. Van Toll came along and went forward. By the Onward Cycle and Motor Works another motor-cyclist was in difficulty, and it struck me that that was a really proper place at which to overhaul a machine, seeing the adjacent facilities for repairs, if such were necessary. At ten minutes past twelve we crossed the line of the fourteenth milestone from Westminster Bridge—exactly sixty-two minutes from the last time we saw Big Ben. And seeing that we had had to escape from the metropolitan traffic, and to behave in a strictly legal manner passing through Croydon, where police and public were as plentiful as billows at Brighton, such a record should be acknowledged to the credit of the makers of our car—viz., the Motor Manufacturing Co., Ltd.—and to the skill of our driver. At Coulsdon, a couple of Benz cars overtook us with Messrs. C. H. Gilbert and T. W. Bywater aboard, and then at Merstham Hill Mr. F. Eason on his De Dion-Bouton motor-tricycle made a good pace. Shortly after Mr. Gregson came along on a twin Daimler car, carrying five passengers—a spick and span turn-out that would have done credit to the four-in-hand parade. From Gatton Corner we were followed by Messrs. Marriott and Cooper on a Humber quadricycle, which kept in our wake as far as Redhill, which was reached at twenty-five minutes to one—by the church clock. Ten minutes later we were in Reigate, where forty minutes were spent in the consumption of lunch and the inspection of the cars, of which only fleeting glimpses had been possible earlier in the day. The enterprising little town looked quite gay, as if on holiday bent. Tradesmen "hung their banners on the outward wall," and loyal residents brought forward the Union Jack and other flags to brave the motorists "and the breeze." Evidently we were members of no mean company, but our cars were the attraction, and even the handsomest men were ignored in the presence of a dainty little Benz or the stately dignity of a Daimler.

At 1.30 p.m. we set off on the second stage of the journey, and I, the prejudiced participant in the morning's parade, was already a cheerful devotee of the motor-car, for there was a pleasurable excitement as we sped past farmsteads and woodlands, the former alive with interested spectators, the latter picturesque in their autumnal tints and strewing the roads with leaves as thickly as they lie in Vallombrosa. And yet nothing escaped the eye; for there was a breadth of view

from the elevation of that dog-car back seat and an extended vision that was as delightful as it was novel. At Crawley, accompanied by two motor-tricyclists, we passed through an admiring crowd that was as enthusiastic as any concourse of people we met on the way. But we were not to have the lead, for Mr. C. Jarrott, as the pilot, quickly overtook us, followed by Mr. S. F. Edge. The pace of the latter attracted some of the ordinary cyclists who had followed our car, regarding it as a splendid cover from the wind that would otherwise have retarded their progress. Some of them followed the Panhard car, but most of those who did dropped it long before reaching Preston Park. These cyclists were as troublesome as flies on horses: they kept as closely as possible to our vehicle, with the result that when the car was eased up or a lower speed put on only the most careful manipulation saved them from biting the dust. Those who value a tidy appearance and unbroken limbs should certainly keep at a respectful distance from motor-vehicles. The rest of the journey was without incident (if we except the many groups of ladies who had bicycled from neighbouring towns off the line of route to see the cars) and we soon got within

and within twenty-minutes of his arrival twenty-six vehicles of all descriptions were reported, one-fourth of those that started in the morning. Among the motor-carists who were thus ready for the triumphal entry into Brighton were Mr. C. H. C. Rush on a Marshall car, he having deviated slightly from the main road to call upon a friend, Mr. W. Dederich on a Heinle-Wegelin tricycle, Mr. W. H. M. Burgess on a De-Dion quadricycle, Mr. Lea, Mr. F. Eason, Mr. C. H. Gilbert, Mr. E. Whomes on an International Benz, and Mr. G. D. Barnes on a Benz dog-cart. One of Arnold & Son's Benz cars had also accomplished the run and took part in the procession. Great attention was bestowed on the charrs-a-banc or the British Motor Coupé Co., which arrived later, with sixteen passengers, having come along at an average of nine miles an hour. Another car that did well was the Motor Manufacturing Company's "Princess," which had a very satisfactory run from the Metropole in London to the Metropole at Brighton.

A photo having been taken by *The Motor-Car Journal* photographer, we formed into a procession to enter Brighton, which we did at a good pace and without disturbing the

Photo by

EARLY ARRIVALS AT PRESTON PARK.

Curzon, Robey &amp; Co.

scent of the briny. A few miles from the Downs Mr. Edge was again seen—this time studying the tire question, in which he has always taken a keen interest, both on paper and on the road. A delay of about an hour afforded him opportunity of pointing the way to Brighton to many of his friends, as they joyfully sped forward while he continued his demonstration in the art of repairing punctured tires. The splendid scenery during the last ten miles of the journey reminded one of Derbyshire hills and dales. Before reaching Preston Park—which we did at half-past three—Messrs. Monk and Lonsdale's motor-car from Brighton passed on the way to Bolney. Arrived at the destination several motor cyclists and a few motor-carists awaited the coming vehicles, and we learned that the first arrival had been young Mr. Lawson who, on a De Dion tricycle, had got to Preston Park at a quarter past two, long before any officials were present to chronicle times. He had missed the lunch at Reigate and was not to be seen when we drew up at Preston Park—probably securing compensation for his gastronomical sacrifice earlier in the day. Of those who had lunched as well as travelled from London, Messrs. Frank Butler and Wridgway were the pioneers, arriving on their motor tricycles at three o'clock. Mr. C. Jarrott appeared ten minutes later,

equanimity of the police. Along the London Road we went as far as St. Peter's Church, and then by the Grand Parade to the sea front. The scene on the Grand Parade was novel, and yet not without a suspicion of the antique. Instead of the Indian file in which we had gone along the business thoroughfare, the procession widened, and with the motor-tricycles rushing along with vehicles dotted among them the scene was not unlike those imaginative sketches of the early-century caricaturists. On the sea front we passed between two rows of spectators, which gradually thickened as the Hotel Metropole was reached, and there a grand concourse of people welcomed the motorists and dispersed not until many of the stragglers arrived. It was a cheering welcome. I descended the car—no longer with a passive interest in automobiles, but with something of the enthusiasm that seems to be a characteristic of all automobilists, and determined to take other rides on motor-vehicles when opportunities are presented. For I am only an ordinary mortal, and at present financial considerations intervene between my pocket and the practical realisation of my dreams on Monday night—dreams in which I was scouring the country on wheels and buzzing over the waves on a motor of fanciful construction and wonderful simplicity.

## A COMFORTABLE TRIP.

BY "PHÄNOMEN."

ALTHOUGH I had been looking forward to the trip to Brighton with no small amount of pleasure, a pang of disappointment ran through me on arriving at Whitehall Place on Monday morning when I learned that the car on which a seat had been reserved for my accommodation had met with a slight accident on the previous day which would prevent it taking part in the run. My disappointment was, however, but short lived, for Mr. F. Sheppard, of Wandsworth, kindly offered me a seat on his Daimler waggonette. I accepted the offer, and had no reason to regret doing so, as our journey, as will be seen below, was a very enjoyable one, unmarred by any incident so far as regards the vehicle. Including Mr. Sheppard, who was at the helm, and myself, our party was six in number. Exactly at 11.5 a.m. the clutch was put in, and we turned into the Embankment and over Westminster Bridge. Nothing of an exciting character happened until the Brixton Road was reached. Here, just in front of us, a Benz car was running gaily along when, all of a sudden, it came to a stand. Our car being well in hand we pulled safely round, and in passing saw that the off-side front wheel had fallen off. Apparently no serious injury was done as later I saw the car at Reigate. After passing one or two vehicles which had been brought to a halt for one reason or another we were passed by a motor-tricycle of a type I had not seen before, the motor being located at the bottom bracket, between the riders' feet. Some amusement was caused on Brixton Hill by a group of farriers from a neighbouring horse-shoeing establishment, who greeted the motor-cars with anything but approbation. Their disapproval was probably not unnatural; as, nearly as black as Othello, they possibly felt their "occupation gone."

The ascent of Brixton Hill was a trying ordeal to many of the cars, the difficulty being increased by the greasy state of the roads, but our conveyance got to the top safely if slowly, only one nasty "skid" being experienced. Streatham was passed through at 11.40, and Norbury reached after safely negotiating a nasty piece of road in the hands of the road repairers. Here we were passed by Mr. Billings on his new "Déchamps" car. The vehicle, which is of Belgian construction, appeared to be going well, although somewhat noisy. The crowded state of the traffic in the High Street, Croydon, was the cause of the first stop of our car, the Town Hall clock striking twelve as we came to a stand. The stoppage only lasted a minute or so, and we were soon again spinning merrily along. At South Croydon, when passing a brick cart, Mr. Moffatt Ford came along on his Peugeot car, and, endeavouring to pass at somewhat close quarters, made it necessary for our conductor to apply his brake somewhat suddenly. I may here mention that our car was provided with the wire-cable band brakes so popular in France, and which seem to be very effective.

When passing the Onward Motor Works at South Croydon we noticed a Mors car had been pulled up, while a little further along we found the Déchamps car at the roadside. We did not see this car again until after lunch at Reigate, when Mr. Billings remarked to us that the carburettor had been giving him trouble. Near Purley Mr. F. B. Percy passed us on his Bollée voiturette, quite oblivious of the fact that his petrol tank was leaking, and that he was leaving a stream of petrol behind him. We tried to attract his attention, but with no success; but eventually we succeeded in intimidating by signs to a policeman some distance ahead to stop the Bollée. Mr. Percy eventually pulled up, and was no doubt somewhat surprised at the large quantity of motor-car spirit his engine had consumed! After passing several tricycles and a Benz car pulled up on the roadside, a steep hill at Smitham Bottom was negotiated, the first half of the ascent being made on the high gear, afterwards cutting in the low gear. The next to pass us was Mr. Leonard on a

Werner bicycle and the Hon. C. S. Rolls on a Peugeot voiturette. Compared with his 8-h.p. Panhard Mr. Rolls looked "very low down in the world," but nevertheless appeared to be travelling easily and at a good pace.

Soon after passing through Mersham our conductor, Mr. Sheppard, decided to leave the Redhill Road, and struck off to the right for Reigate. On this road we had an unusual but pleasing experience, viz.: that of a groom with a high-spirited horse anxious to give it an automobile lesson. In compliance with a request on the part of the groom our driver changed on to second-speed, and for about half a mile the horse was treated to a run in close company with a motor-car. The incident was much commented upon by the members of our party, the opinion being generally held that if other owners of horses would only follow the example less would be heard of cases of horses taking fright at motor-cars. The road to Reigate proved to be a veritable "switch-back," and although some of the hills were very steep we mounted them all safely, and reached the White Hart Hotel, Reigate, at 1.7 p.m. One of our party had for some time being complaining that his "carburettor" was badly in need of a fresh supply of "petrol," so a rapid adjournment to the luncheon room was made, and the necessary operation of feeding the inner man performed. The scene at Reigate was an animated one, the town being gay with bunting, while the townspeople were apparently devoting more attention to automobiles than to their ordinary business.

Our start from Reigate was a little delayed owing to some time being devoted to an examination of the many cars drawn up in the High Street and in the square. However, at 2.5 the signal "all aboard" was given, and the car moved slowly away. No incident of any exciting kind was experienced, and nothing required posting down in my note-book for a considerable time. Near Crawley we passed in a field what appeared to be a Lanchester car, while a little further along the riders of a motor-quadracycle were seen to be busily engaged in endeavouring to discover the cause of the stoppage. The whole of the inhabitants of Crawley had apparently turned out to see the "motors," even the scholars at one school being lined up at the side of the road. Handcross was next reached, and here Mr. Sheppard decided to make a detour to the left *via* Staplefield, joining the main road some distance before reaching Bolney. In this way the descent of the steep Handcross Hill was avoided. Although the advisability of our procedure was somewhat questioned afterwards, and although the detour lengthened the journey by almost a mile, yet the fact remains that on joining the high road we found ourselves in front of several cars which prior to leaving Handcross were ahead of us.

At Bolney a large crowd witnessed our passage through the High Street, and in a few moments we were running through the village of Hickstead. Here our second and final stoppage occurred; it was due to the brake refusing to release itself, the halt being, however, only of a second's duration. About six miles from Brighton we passed one of the British Motor-Coupé Co.'s vehicles taking in a fresh supply of water, while about a mile further on the owner of a Benz car was noticed to be engaged in the troublesome operation of adjusting his belts. Near Patcham our progress was considerably impeded by a herd of big black bullocks with terribly large horns. Notwithstanding the continual tooting of the motor-horn, it was some minutes before we managed to get by the animals. By this time a great change had taken place in the temperature and we all found the benefit of the wraps, etc., with which we had provided ourselves. At Withdean we noticed a Daimler car in a state of collapse, so far as the rear road wheels were concerned. It was now too dark to see the full extent of the damage, but subsequent enquiries in Brighton elicited the fact that the car belonged to Mr. F. W. Rogers, St. Albans, and that the accident was the result of endeavouring to pass between two vehicles. Although the riders were thrown out, it is satisfactory to learn that none of them sustained any serious injury. At Preston Park we were pulled up by the official timekeeper,

who in his log-book put down 4.50 p.m. against our car. From Preston the journey to the Parade, Brighton, was anything but of an enjoyable character, for what with the "hurrahs!" of the thousands of children lined up on the side of the roads, and the execrable broken-up state of the latter, our conductor—and, I might say, his passengers—had rather an exciting time. However, all's well that ends well, and just as the clock was striking five we pulled up at the Hotel Metropole. Our net running time was exactly 4 h. 57 m., so that the average speed for the whole journey was just 10½ miles per hour. There were, no doubt, many cars whose time worked out better than the one I was on, but for a steady, enjoyable run, free from incident of any serious kind, I can strongly recommend any one to a trip on Mr. Sheppard's waggonette.

## THE FOURTH ANNUAL BANQUET.

In the evening the fourth annual banquet of the Club was held in the Clarence Room of the Hotel Metropole, Brighton, Sir J. Somers Vine presiding, supported by more than two hundred gentlemen and about twenty ladies. In addition to all the leading representatives of the automobile industries of this country were a number of owners of cars and of those whose names are identified with automobilism as a sport or pastime. The general press was well represented, as well as the local authorities of Brighton, while several medical gentlemen were also of the company. In last week's Journal appeared a list of those who were to take part in the run, and practically every one mentioned in that connection was present at the banquet. Hence the omission of a full list of the guests from our columns this week.

From the Mayor of Brighton (Alderman E. J. Stafford) an apology for non-attendance was received, and a telegram from the Leicester Automobile Club, conveying the congratulations of Midland motorists and

THE MOTOR-CAR CLUB'S BANQUET.

Curzon, Robey & Co.

## THE ARRIVALS AT BRIGHTON.

"NOVITIATE" and "PHÄNOMEN" have already touched upon the scene as they arrived at Brighton. It remains only to be said that by half-past four more than 50 cars had been received, and that before seven o'clock 95 of the 104 that started had been reported at the Hotel Metropole. Of the nine missing cars it must not be supposed that they all broke down, for a few arriving late were overcome by the modesty of their drivers, who went straight to the stables, not daring the welcome that they imagined was reserved for the last stragglers along the sea front. The run may therefore be regarded as a complete success, both in organization and accomplishment. Only one suggestion would we make on the present occasion, and that is that drivers should retain their numbers on the cars throughout the journey, for as several were missing after Croydon was passed the difficulties of observers who were making notes from various cars were greatly increased. But that is a point for the individual. As a collective run, the motor-car meet of 1899 was a great and distinctive success.

wishing the Motor-Car Club many happy returns of the day, won the first applause of the evening.

### "The Motor-Car Club."

The toast of "The Queen" having been received with musical honours,

Sir J. Somers Vine proposed "The Motor-Car Club." That Club had enabled them to have a very pleasant day, and they were indebted to the Committee for the way in which they were being entertained that evening. Though he did not have the honour to be a member of the Motor-Car Club, but of the Automobile Club, he knew it had most excellent objects, and that its members had the interests of automobilism at heart. It deserved the support of all interested in automobilism, and they should warmly support it and endeavour to recommend it to others. The Club had the distinction of being the first automobile society in the country, and, to a certain extent, all other existing clubs were followers and imitators. But at the same time he knew he was expressing the feeling of the members of its Committee when he said that they desired to co-operate in the greatest harmony with all other institutions of a similar character. In proposing the toast he coupled with it the name of Mr. Baily, the indefatigable hon. secretary, to whose efforts they were very much indebted. (Loud cheers.)

Mr. F. W. Baily responded. He claimed that the reputation of the Motor-Car Club was world-wide. It had carried out the most successful meet and run ever known in connection with the motoring movement in England. (Hear, hear.) No less than 104 motor-vehicles had passed over Westminster Bridge that morning, and of those 95 had reached

Brighton during the afternoon. (Applause.) Referring to the run to Brighton in 1896—the first meet held in England—he said they had then done the best they could, but the percentage was considerably less than that of this year. If they continued to improve at the present rate of progress he believed that next year the arrivals at Brighton would be 100 per cent. One noticeable feature of the latest run had been the great number of private owners who had supported the run and taken part in it. Mr. Baily went on to refer to the efforts of the Club with regard to racing, instancing the successful meeting at the Crystal Palace. Ninety-six races had been held under the racing rules of the Motor-Car Club—(cheers)—and he was not giving too much credit to the organization if he said that practically 100 per cent. of the men who raced on the track were members of the Motor-Car Club. It was hoped to get as members of the Club all practical motorists. Ninety-five per cent. of its present members were actual motorists, and the Club had branches in various parts of England. He was convinced that racing would prove of benefit to the movement, and it was hoped that several of the Club members would be racing in France next year. A motor that would stand the strain of a race was bound to be of service on the road. Three of the members of the Motor-Car Club were having racing cars built, and he hoped they would go to victory in France, and that the members of the Club would win something. Unfortunately they were not allowed to exceed the legal limit of twelve miles an hour on the road. (Laughter and cheers.) But he was afraid they were poor judges of pace, and it was not always advisable to take the speed. In conclusion, he said the organization of the run would have been impossible but for the help of an able executive, an energetic committee and sub-committee and of two gentlemen, whose names he could not help mentioning, Messrs. G. C. Wridgway and G. H. Smith. He returned his hearty thanks for the way in which the toast had been received. (Applause.)

#### "The Motor-Car Industry."

Alderman Sir John Blaker proposed "The Motor-Car Industry." Alluding to Mr. Baily's reference to the legal limit, he said that when the cars entered the town of Brighton that day they travelled at a rate not exceeding the legal limit, and therefore he presumed that the hon. secretary was the legal adviser to the Club. (Laughter.) The motorists must also have thought—and very properly so—that the Brighton police were going to be very lenient. Some of the Corporation workmen had made entrenchments across the London Road—in the interests of the motor-car industry. For if the cars could safely go over the granite it spoke well for their manufacturers. He hoped that the authority with which he was connected would add to the many things already existing an Intelligence Department, for he felt that, seeing a great gathering was to take place, such a work as that should not have been done at that particular time, and he assured those present that it was an oversight on the part of some comparatively young official. It was his privilege three years ago, as mayor of the town, to ride on the first car that officially entered it. The weather was boisterous and the pace was rather faster than he had been used to, and he hoped that a kindly Providence would bring them safely to the hotel, and that he would not have the pleasure of going on that car again. (Laughter.) He was pleased the Club had suggested that those who drove cars should drive them at such a pace as would commend them to the inhabitants of this country. We were an extremely conservative people, and did not take very rapidly to new inventions. Therefore it was necessary to educate the public up to automobilism, and in the interests of those engaged in the industry it was desirable that that advice should be followed. He remembered that at the first banquet of the Club at Brighton one of the speakers, in speaking of "Emancipation Day," said they would soon be able to go to London for eighteenpence. Many Brighton people were waiting for that. (Laughter, and "Hear, hear.") The speaker to whom he referred was now on the ocean. He could, however, conscientiously wish great success to the industry. It had long been crippled by legislation, which gave a great start to Continental countries. But now the restrictions were removed they would not always see upon the cars, as on some other things, "made in Germany" or "made in France." The utility of the cars was immense, and he could not help thinking what a godsend some of them would have been to Colonel Baden-Powell at Mafeking. In the wars of the future the motor-car would play an important part. (Cheers.) Referring to Brighton Sir John said it was one of the most up-to-date towns in the country, and was able to supply, from its own stations, owners of electrical cars with sufficient electricity for two shillings to take eight or ten people to London. It was a point that would largely affect the industry if the towns of the country could supply the electricity so that owners could always be sure of charging their vehicles. He wished the industry every possible success. (Applause.)

Mr. John H. Gretton replied for the motor-car industry, which, he said, was a very important one, and no one could say at the present moment how far its limits would extend. It was not confined to this country, but was spread all over the world. They were indebted very greatly to their French friends for introducing the industry to the notice of the world. France was not the only country that was associated with the motor-car. To Germany also we owed a debt of gratitude. It was well that they should carry their minds over the field of enterprise, and we in Great Britain should be proud to know that we have come to equal rank with German and French firms. The history of economic progress and industry proved that Great Britain could come level with any industry that was started anywhere in the world. Although we were indebted to France and Germany for the initiation of this great industry, we had come at least equal to them. (Cheers.) If they analysed the number of cars that had taken part in the tour and had reached Brighton, they would recognise that Great Britain was equal either to France or Germany. He noticed

that the Mayor of Coventry had recently said\* that he hoped they had found an industry that would revive and carry prosperity to his town. He said it was an infant industry; but if there was any truth in the statement about a new company in America with a very large capital, he (the speaker) asked how could it be an infant industry? It was, on the contrary, well grounded, and would produce a very large increase to the commerce of the country and be of benefit also to the industrial classes. (Hear, hear.) He had noticed, when comparing the cars coming in that day with those that entered Brighton in 1896, that the cars in the earlier year seemed to consume more water than spirit, but now they consumed more spirit than water. If that was any indication, he hoped it indicated progress in the industry. (Laughter and cheers.) All were glad to hear from Sir John Blaker of the welcome Brighton would always prepare for motorists, and nothing could be more satisfactory to those engaged in the motor-car industry than to recognise—sincerely recognise—the effort of any organization to promote their interests. Among those present were many who took pleasure in riding or driving, and they were helping to convince the country that the motor-car was a practical success. They were constantly being told to take care not to upset horses, but he would ask the drivers of horses to take care that they did not upset the motor-car. (Laughter and cheers.) Although he had a great respect for horses, he did not wish the roads to be entirely appropriated by them. They ought not to sit down under the advice that they ought not to interfere with horse-drawn vehicles. They should say to the owners of such carriages, "Let us understand one another and recognise that no one has any more rights than another." In this country we believed in liberty—equal rights, and no interfering with the rights of another. It should be a question of give and take. Those who drove motor-cars should take care and not interfere with the rights of horse-driven carriages, and they should expect and insist that the drivers of horse-driven vehicles should not interfere with motorists. (Applause.)

#### Other Toasts.

The Chairman, referring to the next toast, that of "The United Services," said under the circumstances he was sure they would show even greater warmth than usual in drinking to the health of the defensive forces of the Empire. Reverting to what Sir John Blaker had said about the use of motor-cars in warfare, he expressed surprise that the automobile had not been employed in South Africa, where, excepting certain portions of the country, the roads were well suited. Although, however, they were not being utilised in the present instance, he was convinced they would ultimately play their part. He called on Colonel Gouraud to respond to the toast; and, although that gentleman was an American officer, the innovation was particularly appropriate at the present time.

The toast having been enthusiastically received,

Colonel Gouraud was heartily welcomed when he rose to respond and testify to the good feeling between the people of the United States and those of this country.

Mr. Alderman J. J. Clark proposed "The Press," according full praise to the work of both the general and technical journals of this country. The trades and industries were worthily represented in the press, and although the motor-car industry was not an old industry it was being well served.

Mr. Charles Cordingley (*The Motor-Car Journal*) responded. He said the object of the gathering was to demonstrate the great improvement that had taken place since 1896. Seeing the few vehicles that then reached Brighton and the large number that started and arrived safely on the present occasion, it was clear that an immense improvement had taken place. It was well to bear in mind that the majority of the cars were of British construction, and that many of them came through with but one stop, and that not for water but for lunch. (Hear, hear.) If the Motor-Car Club had been successful in showing the possibility of the motor-car going practically any distance, it had been of service to the industry, and if it had done nothing else than organize the run that day it had justified its existence. The motor-car was undoubtedly the vehicle of the future. Thanking the company for the generous way in which they had received his name, Mr. Cordingley mentioned the fact that although he had only recently been connected with motor-car journalism, he had many years before advocated the movement in another journal (*Industries and Iron*) before motor-cars were run in this country. (Cheers.)

Mr. W. J. Towner (*Brighton Gazette*) also responded, making humorous references to the family character of the motor-car capacity.

"The Ladies" was felicitously proposed by Mr. Holroyd Smith, and the health of the Chairman heartily drunk, Mr. Sheriff Hand proposing the toast. With a brief response from Sir J. Somers Vine, the proceedings terminated with the National Anthem.

ANENT the discussion which is taking place in America as to the most suitable term for motor-car, one correspondent writes: "Why not call it a 'goalone' and then let it alone?"

THE Old Dominion Motor-Car Co., is petitioning for a charter to run a service of motor-vehicles in the city of Richmond, Va.

AN American contemporary remarks that "there are now, as far as can be learned, eighty-one chartered automobile companies in America, with the modest little capital of 430,000,000 dols." (£86,000,000)!

\* *Motor-Car Journal*, November 10th, 1899, p. 564.

## The Automobile Club's Meet.

**B**RIGHT and cheery weather favoured automobilists on Tuesday, and again the sun beamed on the assemblage of motor-cars in the neighbourhood of Whitehall. The distinction of the vehicles from those of the previous day was most noticeable. It appeared as if special arrangements had been made to exhibit as many varieties as possible, there apparently being no two alike. There was a Daimler Parisian (a new car appearing for the

first time), with its sweet French gray colour, handsome body, aluminium frame and pneumatic tires. There were electric cars, Panhards, Peugeots, Daimlers (twin and single motors), Mors, Vallées, Benzs, Gobron-Brillié's, and a goodly assemblage of the business-like cars of the Motor Manufacturing Company.

Worthily placed first was the Daimler Parisian, with Mr. Critchley driving and Mr. Johnson as passenger, and behind were some sixty cars and tricycles in line. Below we give a list of vehicles and drivers. The passengers' names we have been unable to obtain, but we may say that out of more than two hundred who lunched at Sheen House certainly nearly half that number were ladies, whose bright attire and sweet presence gave additional charms to the gathering.

Punctually as the clock struck twelve a start was made, and the procession turned to the left with a view of going through St. James' Park and Constitution Hill into Hyde Park. After leaving Hyde Park, the route was through Hammersmith, over the bridge, and then *via* Lonsdale Road to Sheen House.

The traffic soon divided the procession, but all safely reached the Club House, some thirty or forty vehicles being close up to each other, and the stragglers coming in shortly afterwards.

The run was very much enjoyed, although inconvenience was caused by the abominable state of the wood pavement in the Hammersmith Road. Arrived at Sheen House the cars, to the number of over fifty, were ranged round the lawn, forming a charming scene for a November day. The sun shone pleasantly, and reflected its rays on the highly polished steel parts, showing the perfection of the many coloured panels of the cars. It was one of the brightest scenes ever seen in the automobile world of this country, and never before have we looked upon such a beautiful array of vehicles in the open air. As before stated, they were of all kinds, from the tiny voituresses and the smaller French cars, in comparison with which the mighty charr-a-bancs and twin Daimlers looked like giants. The beauty of the design of many of the bodies showed that not only engineers but carriage builders as well have been studying improvements, with a view to pleasing the eyes of the public, which has been so long accustomed to horse-drawn vehicles.

That the motor-car industry of Great Britain owes much to the Automobile Club no one will deny, and many of the improvements noticed in the vehicles taking part in this year's parade have probably been inspired by this representative Association. If during the next twelve months the progress of the past year is increased in as great a ratio the advent of the perfect vehicle cannot be long delayed. And by securing the patronage of the leaders of Society for our industry the Automobile Club is helping automobilism to prosperity and securing universal favour for the motor-car. Those whose apparent delight is to retard the progress of the inevitable, should have been at Sheen House on Tuesday. They would then have realised that automobiles can combine grace and beauty with utility and reliability.

Below we give a full list of the cars and motor-cycles that attended the meet:—

Mr. and Mrs. Northey and Lady Muriel Paget, Electric Motive Power Co., Ltd.; the Hon. Evelyn Ellis, 8-h.p. Panhard; Mr. Frederick R. Simms, 5½-h.p. Cannstatt Daimler; Club Wagonette, lent and made by Daimler Motor Co., Ltd.; Club Wagonette, lent and made by Motor Manufacturing Co., Ltd.; Club Wagonette, lent and made by Motor Manufacturing Co., Ltd.; Club Wagonette, lent and made by Motor Manufacturing Co., Ltd.; the Hon. John Scott-Montagu, M.P., 12-h.p. Daimler; the Hon. C. S. Rolls, 3½-h.p. Peugeot; Mr. Alfred Bird, 6-h.p. Panhard; Mr. Alfred Harmsworth, J.P., "Columbia" Electric; Mr. Alfred Harmsworth (driven by Mr. Campbell Muir), 8-h.p. Panhard; Mr. C. K. Gregson, 12-h.p. Daimler; Mr. John Gretton, Motor Manufacturing Co.'s "Iveagh" Phæton; Mr. Hugh Weguelin, 8-h.p. Panhard; Mr. Bernard Weguelin, Daimler; the Hon. J. H. Berkeley, Electric; Mr. J. Lyons Sampson, 5-h.p. Benz; Mr. J. S. Critchley, New Daimler; Mr. Montague Grahame-White, small Daimler; Mr. Mark Mayhew, 8-h.p. Mors; Captain G. D. Sampson, J.P., Benz; Mr. J. Ernest Hutton, J.P., 12-h.p. Panhard; Mr. Walter C. Bersey, London Motor-Van and Wagon Co.'s Daimler; Mr. W. M. Hodges, London Motor-Van and Wagon Co.'s Daimler; Mr. S. F. Edge, 8-h.p. Napier; Mr. T. B. Browne, 6-h.p. Panhard; Mr. Chas. Jarrott, 6-h.p. Panhard; Dr. Bruce Porter, 6-h.p. Daimler; Mr. M. H. Buckea, Motor Manufacturing Co.'s Wagonette; Mr. Chas. Cordingley, Motor Manufacturing Co.'s Dog-Cart; Mr. Ernest Owers, 6-h.p. Daimler; the Rev. Arundell Whatton, 8-h.p. Mors; Mr. Hy. Edmunds, 6-h.p. Daimler; Mr. E. Estcourt, 6-h.p. Daimler; Mr. A. W. Armstrong, Peugeot; Mr. Henry F. Joel, Joel's Electric Victoria; Mr. Edgar Soames, 6-h.p. Daimler; Mr. A. F. Mulliner, 6-h.p. Daimler; Mr. Theodore F. S. Tinne, Cannstatt Daimler; Mr. M. Cappellen, International; Mr. W. H. Kitto, Benz; Mr. F. Strickland; Mr. S. F. Beevor, Hewetson's Benz; Mr. W. P. C. Wills, Hewetson's Benz; Mr. R. W. Buttemer, Hewetson's Benz; Dr. Charpentier; Mr. H. Ravenshaw; Mr. Algernon Bentley, Victoria; Mr. William Hurst, Bollée; Mr. H. J. Dowsing; Mr. Francis Leigh Martineau, Voiturette; Dr. Lehweß, Gobron-Brillié; Mr. T. H. Smith, Daimler; Mr. Clift, Electric. The following were riding motor-cycles: Messrs. Frank Butler, Robert Phillips, F. W. H. Hutchinson, Herbert Fuller, R. H. Fuller, L. H. Walter, W. J. Crampton, S. R. Roget, Dr. J. J. Acworth, Lieutenant Windham, and Mr. Cecil Grimshawe.

### THE ANNUAL DINNER.

The annual dinner of the Automobile Club of Great Britain was held in the Whitehall Rooms of the Hotel Metropole, London, on Tuesday, under the presidency of Mr. Roger W. Wallace, Q.C., who was supported by many influential admirers of the automobile, including Lord Ampthill, Lord Suffield, K.C.B., Lord Borthwick, the Right Hon. C. Stuart Wortley, Q.C., M.P., Right Hon. G. Shaw Lefevre, Sir James Pender, M.P., the Hon. John Scott Montagu, M.P., Mr. Charles McArthur, M.P., Major H. C. L. Holden, R.A., F.R.S., Major Ross, Hon. C. S. Rolls, Hon. J. H. Berkeley, Professor Vernon Boys, Colonel Magrath, Dr. Acworth, Dr. Lehweß, Captain the Honourable Cecil Dunscombe, M. Georges Lemaitre, M. de Bary, Messrs. F. R. Simms, E. Shrapnell Smith, W. Worby Beaumont, R. E. B. Crompton, Frank H. Butler, Hiram S. Maxim, T. W. Staplee Firth, R. E. Phillips, C. Harrington Moore, Julius Harvey, R. H. Buttemer, J. E. Hutton, J.P., H. J. Mulliner, Mark Mayhew, Lyons Sampson, Thos. Parker, Lawrence Jones, W. C. Bersey, Charles Cordingley, T. B. Browne, F. W. Lanchester, S. F. Edge, C. Jarrott, Roger Fuller, E. K. Purchase, C. Heyermans, Campbell Muir, H. F. Joel, A. T. Mulliner, M. H. Buckea, H. A. House, Alfred F. Bird, Killingworth Hedges, Bertram Blount, C. Opperman, Sherwin Holt, J. W. Woodall,

Hugh Campbell, Henry W. Lucy, Alfred Jones, J.P. (senior vice-president of Liverpool Branch), H. Edmunds, W. J. Crampton, H. Fuller, E. Owers, H. Mercer, J. R. Nesbit, A. G. New, John Henry Knight, Percy Northey, F. W. Hutchinson, C. Grahame-White, Buckingham, George Hopkins, Arthur Darbishire, Herbert Hankey, J.P., W. Leonard, Beckett Hill, S. B. Cotterell, A. Musker, T. C. Palmer, M. Cappellen, Becker Carrten, Rudolph de Cordova, L. H. Walter, F. L. Martineau, Edward Kennard, W. Hardy, Robert Bird, J. Holder, Claude Crompton, Dangerfield, S. Roget, C. V. Pugh, J. S. Taylor, Dugald Clerk, T. J. Barratt, Herbert Capel, L. O. Engleton, J. Grahame-White, Cecil Grimshaw, Edward Pope, Ristori, Pollen, Lawrence, Frank Davies, Wyllie, W. H. Kitto, E. A. Brayley-Hodgetts, A. H. Stanley, Alfred Ledger, Harold Heatly, Mears, Todd, Thrupp, Hipkins, F. P. S. Harris, Stanley Spooner, Claude Johnson (secretary), and several others, the company numbering about one hundred and seventy in all.

The toast of "The Queen and the Royal Family" having been duly honoured, the Chairman gave

#### "The Navy, Army, and Reserve Forces."

Referring to Major H. C. L. Holden, R.A., F.R.S., as the head of the gun department at Woolwich, Mr. Wallace dwelt upon his knowledge of electricity and mechanics and the help he had rendered to the Automobile Club in many ways. The Major had shown his interest in the movement, and they hoped he would at some time recommend to the War Office that automobiles should be used by Her Majesty's forces.

Major Holden responded, and said that during the whole of the time he had been responsible for testing guns not a single one had failed when on service in the field. The question of automobilism concerned the Royal Engineers and the Inspector-General of Fortifications. As most of those present were aware interest was taken by the authorities in the subject, and official representatives of the War Office were present at the Liverpool trials. No doubt as soon as the automobile became a little better known and a little more reliable—although it was nearly absolutely reliable now—the question would be taken up, and automobiles would be used for the purposes of war. To some extent a ship was an automobile, and if they urged that a ship would not go on land he would reply that their automobiles would not go on water. (Hear, hear, and laughter.) It took many years to introduce the bicycle into the army, and it would take some time to introduce the automobile. In the torpedo they had an engine that indicated 55 h.p., and weighed less than 1 lb. for every effective horse power. He thought automobilists would be glad to possess such an engine, and in conclusion wished success to the development of the movement. (Cheers.)

#### "The Houses of Parliament."

Mr. Alfred L. Jones, J.P., senior vice-president of the Liverpool branch, proposed "The House of Lords and the House of Commons." He said the existence of their society depended upon the power they obtained in Parliament. They had to thank Parliament for their existence. But he reminded those present that they had been in existence three years, and unless they got more power they might become troublesome. The question that concerned him most was that of motor-wagons. With the three ton tare they could not produce a commercial wagon, and they wanted the tare extended to four tons. It was to be hoped that this would be secured, and British industry thus given a chance. (Hear, hear.)

The toast having been drunk,

Lord Ampthill thanked the Club for the honour paid him in asking him to respond for the House of Lords. He had rejected the idea that it was done in order to smooth the way for further demands for legislation, although the remarks from the proposer of the toast had perhaps raised a doubt. Looking at the connection between the House of Lords and the automobile he had come to the conclusion that the former presented an ideal which every maker and constructor of a motor-car had in view. He took it, the qualities which they aimed at were speed, noiselessness, and absence of gas or smell. Nobody would deny that if there was a political machine which did its work with a maximum of speed and minimum of gas and noise it was the House of Lords. (Laughter and cheers.) He had always understood that the House of Lords was ornamental. That, too, was an attribute the maker of motor-cars kept in view. In conclusion, he declared there was no doubt the motor-car had before it a future of universal popularity and utility. (Cheers.)

The Right Hon. Charles Stuart-Wortley, Q.C., M.P., referred to the adventure of one of the Members of the House of Commons who had got into Palace Yard in a motor-car. His passage was not undisputed, and for a time they felt the constitution was in danger. But, happily, it was not long before the matter was settled. Passing to current topics he said the House of Commons had recently voted special supplies, and they hoped to receive value. (Cheers.)

#### "Success to Automobilism."

The Right Hon. George Shaw-Lefevre, M.P., proposed "Success to Automobilism." He felt he was associated with the toast because of the fact that he was the first, as a member of the late Government, to recognise the absolute necessity for freeing this great industry from the foolish restrictions under which it suffered, and to introduce a bill for that purpose. (Hear, hear.) But there occurred one of those cataclysms in political life which destroyed the Government, destroyed his bill, and lost him his seat. But his successor at the Local Government Board, Mr. Chaplin, took up his bill, improved upon it and carried it to a successful issue. Looking back upon the past he felt the change of *personnel* was not altogether disadvantageous to the interests of the cause they had at heart. He was not by no means certain that he could have carried his bill through without opposition, and certainly he was not sure that his

measure would have passed the august House of Lords. But when a Minister like Mr. Chaplin, whose interest and knowledge of horseflesh was well known, and a statesman who was so much in the confidence of a rural constituency, adopted the measure it was absolutely certain to face all dangers successfully. He was by no means certain that so good a bill could be passed by Mr. Chaplin at the present moment. There had been something of a reaction against automobilism, and in the rural districts people were appreciating what had been passed, and there was actually an agitation afoot against the extension of automobilism. The Local Government Board was being bombarded with petitions from district councils and other local authorities praying for further restrictions against the "dangerous machines" which were so frequently seen in the country. He hoped that Mr. Chaplin would stand out against any restrictions of that kind. (Hear, hear.) At all events he (the speaker) hoped that Mr. Chaplin would consult the Automobile Club before agreeing to any legislation, for that organization would be able to give the Local Government Board most valuable advice. He was sure there would be much support for Mr. Chaplin in the House of Commons in his efforts to resist any reactionary efforts in that direction. Many reasons were being urged against automobilism. In the first place it must be recognised that in some parts of the country there was an intense conservative feeling similar to that which existed against railways and, later, against bicycles. Others objected to motor-cars because they did not like the smell and others because they did not like the pace, but all such unreasoning feelings would melt away in face of the advance of the industry, just as was the case with railways and bicycles. Accidents had occurred through horses being unaccustomed to motor-cars. That was a failing which also would pass away as the horses were educated on the subject. He recently read that a learned judge had laid it down that inasmuch as Parliament had recognised that the motor-car might frequent the highways, horses should be educated to face such vehicles. When uneducated horses met with motor-cars they, and not the motor-cars, should be held responsible for the consequences. It was said that some unwise people had been known to drive their cars at improper speeds. If that was so the Club would have its eyes upon them and assist the police to secure a conviction. But a few instances of that kind should not be allowed to damn the whole industry. Those who knew anything about motor-cars knew that it was possible to drive them rapidly and keep them well under control where there was no important traffic, but relaxation of speed became necessary in the town districts. A learned judge had been spending the vacation in a motor-car tour throughout England, and the average of his speed was between sixteen and twenty miles. (Oh, and laughter.) He paid him (the speaker) a visit in the course of his tour, and said he had travelled at that rate. Now, that learned judge knew what the law was. The law did not allow him to go at a greater rate than twelve miles per hour, and it was therefore to be supposed that the law only applied when passing in presence of other people than yourself, and that on a road which was not frequented by anybody you might go at any pace you like. Great improvement had been made in automobiles during the last three years, and although that had been considerable it was very much behind what had been done in France. In France the number of motor-cars in use at the present time was enormous, and was increasing at a rate beyond anything in this country. The estimate of the *Engineer*, which placed the number here at 200, was an under-estimate. (Hear, hear.) The number, he thought, must be nearer a thousand. One firm alone had made 300 motor-cars and had under construction no less than seventy, and it was an undoubted fact that the demand for motor-cars was such that the trade could not supply them. It was impossible to get a motor-car completed in anything short of six or seven months. Motor-cars were largely imported from France. The French were ahead of us, not only in the number of motor-cars they turned out, but also in the designs. One of the principal manufacturers in Great Britain was now undertaking to supply motor-cars according to the latest French design. He confidently believed they were on the eve of a very great change in this country. The introduction and extension of the motor-car industry would effect a revolution throughout the rural districts bringing them into closer association with dwellers in the towns. While they had every reason to be satisfied with the progress that had been made, they might expect greater progress in the future. He proposed with the greatest pleasure, "Success to Automobilism." (Applause.)

The toast having been given,

Mr. Roger Wallace responded. He said every member of the Automobile Club was indebted to Mr. Shaw-Lefevre for his excellent speech. He was certainly the right man to be in that position on the toast list, because he was also the first to introduce into Parliament the Light Locomotives on Highways Bill. It was notorious in this country that we were slow to adopt new improvements. Legislation, too, had been a means of keeping automobilists behind. In France they had no restrictions, no red flag and no certain speed regulation, but he (the speaker) ventured to think that the same thing would happen in this country as regards the automobile as had happened with electric lighting. Legislation had restricted that industry as well, but now we were very much ahead of other countries in that respect. He hoped no further restriction would be imposed upon automobilists, and it might not be wise for the Club to want any further facilities. It seemed that they had sufficient facilities, that they could go fast enough in spite of laws—provided they were not found out. At any rate, the learned judge already referred to seemed to think so. (Laughter and cheers.) In France automobilism was very much ahead of England, and we must feel that if we made a comparison of the amount of work comprised in the French automobile industry. One firm in France had orders for £600,000 worth

of automobiles. He referred to the firm of Panhard. More than a million pounds sterling per annum was paid in wages alone in French automobile factories. These figures with regard to an industry only just commenced in France must make us feel how far we were behind. Although we had not much in this country, some of the members of the Automobile Club had been able to make a good show in France. Mr. John Scott-Montagu would have won a race (Paris and Ostend race) but he started a little late over some trivial matter. Even then he came in third. That was upon an English-built car. Mr. Rolls came in second in the race, driving, he was sorry to say, a Panhard car. But he occupied a much more distinguished place in other races, and in the Biarritz to Paris contest he came in first in his section. They had the material in this country to win races. There were men who would drive the cars if the manufacturers would build them cars to drive. In France they were allowed to have races, but because of the regulations in this country it was impossible to have similar contests, and so the Automobile Club was organizing, in conjunction with the French Automobile Club, races in France where Englishmen could compete. Unless there was a means of thoroughly testing cars kept going at a high speed they would be unable to tell what they were capable of doing, and it was only in that way that they could arrive at excellence. (Hear, hear.) Racing had improved the breed of horses; but with regard to automobilism they should see that in going through towns and other places where accidents might happen they kept within the limits of the law. The Automobile Club hoped to exercise a judicious control over its members, and also to give assistance to horsemen wanting to educate their horses to pass motor-cars. Races were very interesting, and he recommended the members of the Club to go abroad and see them. Though they could not go in for racing in this country, they could go in for trials, which would give them knowledge of what the motors could do. The Club was organising a 1,000-mile trial, and the cars competing would be exhibited in different towns. Either before or after the trials there would be an exhibition in London. The newspapers were assisting in connection with these trials. The *Daily Mail* would give £100 as a first prize and £50 as a second in the voiturette class, and £10 to every car which successfully accomplished the journey. The *Sheffield Telegraph*, the *Liverpool Daily Post*, and the other great papers of the provinces were also lending help. Reverting to other Club matters Mr. Wallace read a congratulatory telegram from the Swiss Automobile Club, concluding with "Hip, hip, hurrah!" for the motor-car and the suppression of cruelty to horses." The Club had been making progress. It was the only club that represented their industry, and nearly all sections of those who had had to do with automobilism recognised. They were taking charge of the automobile section in the Paris Exhibition (British Section), and the other day the manufacturers of this country had asked them to assist in the formation of a federation, so that they would hold all exhibitions under their auspices. Speaking of the membership of the Club he said more than 160 new members had joined this year, and Mr. Harrington Moore had sent out a whip to members to endeavour to get others to join. Many responses were being made to that appeal! The Automobile Club of France paid £80,000 for their premises, which they were about to extend. It was now the principal club in France, and he hoped they would have the same state of things here. Next year they hoped to have Mr. Chaplin to speak for them in the same way as Mr. Shaw-Lefevre had done. (Applause.)

#### "The Press" and "The Visitors."

The Hon. John Scott-Montagu, M.P., proposed "The Press." They might congratulate themselves, he thought, in having the press of England to record their doings with fairness and generosity. They had heard of the education of horses. It seemed to him that they had to educate the press, for those who reported their movements had to have an acquaintance with technical details. He had taken Mr. H. W. Lucy for a ride on his car, which resulted in a convert to automobilism, for he (the speaker) had received letters from Australia as to motor-cars in consequence of Mr. Lucy's writings in the *Sydney Morning Herald* on the subject. He asked motor-carists to give facilities to pressmen to ride on their cars. (Hear, hear.)

Mr. H. W. Lucy ("Toby, M.P.," of *Punch*), in response to the toast, described a ride he had had on the motor-car belonging to the Hon. Scott Montagu. It was on a Sabbath morning, with the bells pathetically tolling. Greatly daring, he mounted the car. There were three other passengers; one was a gallant officer in the Queen's Navy, who would probably have preferred a quiet scull on a smooth pond. He slowly ascended the vehicle. They would remember the man in the Scriptures who was miraculously cured of blindness, and who saw men like trees walking. He (the speaker) had a recollection of seeing, as they dashed along the highways, the trees like kangaroos leaping. He had also recollections of an uplifted hand with a figure in uniform and something which might have been a policeman's helmet. He fancied it was a constable anxious to take their names. Happily it was out of sight before they found an opportunity of speaking. (Laughter.) That was fortunate, and avoided a scene in the police-court in the morning, with three M.P.s. in the dock and himself in the witness-box giving Queen's evidence. It was literally a moving time, and he was astonished at the perfect control displayed by the veteran driver. Referring to Lady Warwick's recent letter in which she was reported to have said, "Why cannot the ladies belong to the Automobile Club?"—at present they do nothing useful and are very expensive," he suggested men would have said, "Very dear." What the countess meant was that by so doing the Club would largely extend its usefulness and greatly add to its attractions. He had much pleasure, on behalf of the Press, in thanking the Club for its welcome. (Cheers.)

Mr. W. Worby Beaumont, M.I.C.E., proposed "The Visitors."

observing that automobilists were under an obligation to all who gave attention to the development of the new industry. (Hear, hear.)

Sir James Pender, Bart, M.P., responded. He confessed to being a great lover of the horse. Yet he welcomed the introduction of automobiles in this country, because he saw horses struggling with great loads on pavements as slippery as glass. He hoped to see the day when automobiles might be introduced in such numbers that the loads would be taken off those wretched horses. Recently in America he was on a Stanley car—a very light vehicle—but on examination and inquiry he was inclined to think that some of the cars produced in this country were more suited for him. (Cheers.)

## THE PEUGEOT MOTOR-VOITURETTE.

ONE of the large French automobile concerns—La Société des Automobiles Peugeot, of Audincourt (Doubs)—has recently met the demand for a light two-seated voiturette by putting on the market the elegant vehicle shown in the accompanying illustration. The motor, which is located at the rear of the vehicle, is of the horizontal two-cylinder type, and is of 3 h.p.; it is water-jacketed, and is provided with either tube or electrical ignition as desired. Three forward speeds and a reverse motion are provided, the power of the motor being transmitted from the crank shaft through one or other pair of spur wheels to a countershaft, and from the latter to the rear road axle by sprocket wheels and chains. The variable-speed gear is controlled by a hand lever affixed to the side of the car. The speeds range

from 8 kilometres up to a maximum, on good level roads, of 35 kilometres per hour. The frame of the car is built up of steel tubing, while the wheels are of the cycle type, fitted with pneumatic tires; the rear wheels are 31½ in. diameter and the front ones 25 in. Two brakes are provided, one controlled by a foot pedal and the other by a hand lever; while the steering is effected by a bar in the usual way. Provision is made for the storage of motor-car spirit sufficient for a run of 200 kilometres and of water for 100 kilometres. A radiating coil for the cooling of the water is fitted under the centre of the car. The weight complete of the vehicle is given as about 350 kilogrammes, or not quite 7 cwt.; while its dimensions are—length 7 ft., width 4 ft. 2 in., and height 4 ft. 4 in.

IN reply to the enquiry of J. H., of Bicester, we may mention that it is necessary to obtain an Inland Revenue licence in respect of a motor-tricycle, the cost of the same being 15s.

MANY were surprised on Monday to find the Hon. C. S. Rolls not mounted on his well-known 8-h.p. Panhard racer, but on a Peugeot two-seated voiturette of the type illustrated above. We learn that Mr. Rolls has sold his "fire engine" for no less than £1,280, and is now offering £1,680 for a 12-h.p. Panhard racer.

## MOTOR-CARS ON THE CONTINENT.

(From Our Own Correspondent.)

### Mr. W. K. Vanderbilt an Automobilist.

AMONG the latest purchasers of an automobile is Mr. W. K. Vanderbilt, who is now the possessor of a handsome Panhard car. Accompanied by Mrs. Vanderbilt, he left Paris on the 4th instant for Nice, breaking the long drive by a few days repose at Marseilles.

### The Health of M. Craninckx.

ALL English automobilists will learn with pleasure that the ultimate recovery of Mr. Charles Craninckx is now assured, and that the doctors anticipate he will not conserve any evil effects from his terrible accident at Waulsort, Belgium.

### An Austrian Electrical Coupé.

REFERENCE has already been made in this column to the increasing attention which is being devoted to automobiles in Austria. A firm which has been devoting itself to the construction of motor-vehicles for some time past is Messrs. Jacob Lohner and Co., of Porzellangasse 2, Vienna IX., both electrical and petroleum spirit motor cars being now turned out by this concern. The accompanying illustration shows the Lohner three-seated electrical coupé. It is propelled

by a 5-h.p. Egger electro-motor, geared by spur wheels to the front axle. The battery, which is located under the driver's seat, comprises 42 cells of a capacity of 100 ampere-hours, the weight being given as 8 cwt. 28 lb. The controller is arranged to give four forward speeds and a reverse motion, while in one position the motor is made to act as an electrical brake. In addition to the electrical brakes, tire brakes operated by a foot pedal are provided. Steering is effected by a bar, while the wheels are of wood fitted with solid rubber or pneumatic tires as desired. The makers state that a distance of from twenty-five to fifty miles can be covered on one charge of the battery, according to the condition and gradients of the roads traversed. A noticeable feature in the Lohner vehicles is the employment of front wheels of a larger diameter than those at the rear.

### The Paris-St. Petersburg Race.

As is well known, the Automobile Club of France had formed a project to decide next year a great race from Paris to St. Petersburg, but ultimately relinquished the idea upon presentation of the report of MM. Thévin and Houry, whom they had delegated to examine the various routes and to advise as to the feasibility of the scheme. The report of these delegates has only recently been published in detail, although their condemnation of the Russian roads has been known for some time and has

occasioned considerable controversy. A perusal of the report *in extenso* satisfies one that MM. Thévin and Houry have carried out their work of inspection very thoroughly, and that their decision as to the impracticability of deciding the race is well founded. They express a perfectly favourable opinion on each of the three grand routes from Paris to Berlin, these being *via* Liège and Cologne, Frankfort and Eisenach, and Frankfort and Cassel, albeit the first-named traverses a region somewhat too populous to permit of automobile racing with entire safety. After leaving Berlin the delegates found excellent roads *via* Königsberg to Tilsit, and it was only after passing the Russian frontier en route for Riga and St. Petersburg that they encountered roads of a character sufficiently bad to render speed travelling on them an impossibility. The distance between the German and Russian capitals by this itinerary is 1,530 kilometres, of which 750 are in Russia. Upon arriving in St. Petersburg the two delegates were received by Prince Thilhof, the Minister of Roads, who honoured the A.C.F. with an assurance of his assistance should it be decided to attempt the race. This, however, the Club have decided not to do, a decision strengthened by the opinion of MM. Thévin and Houry that the progress of automobilism in Russia would receive but little impetus from the holding of any race over the imperial roads.

### Bremen-Hanover Race.

THIS race was decided on the 5th instant over a route of 120 kilometres. Four motor-cycles and two voiturettes competed, and the winner was found in Carl Steinfeld, who covered the distance in 4 h. 12 m.

### A Hurtu Electrical Cab.

LA COMPAGNIE DES AUTOMOBILES ET CYCLES HURTU, 54 Rue Saint-Maur, Paris, is turning its attention to electrical vehicles in addition to petrol cars. The Company has just completed an electrical cab which comprises several novel features. There are two electro-motors, geared to the front axle on the Marchena-Gigot system. The battery consists of forty-two accumulators of a new type, known as the Geoffroy-Delore, the capacity being given as 150 ampere-hours. I hope to send you full particulars of the new vehicle shortly.

### The Renault Car.

I UNDERSTAND that Messrs. Renault, of Billancourt, are introducing some modifications in the neat voiturette illustrated in *The Motor-Car Journal* for September 15th last. The frame of the vehicle is to be made both slightly longer and wider, while a De Dion motor of 3 h.p., with water-jacket, is to be fitted.

### The French Automobile Club.

A *garage* is to be established in connection with the Club's house in the Place de la Concorde in Paris; it will comprise a *garage* proper for the storage of members' cars and a gallery in which motor-vehicles may be exhibited for sale. There is no doubt that the *garage* will be largely made use of by the members.

### Illness of Herr G. Daimler.

CHAUFFEURS in all parts of the world will regret to learn of the illness of Herr Gottlieb Daimler, of Cannstatt. I understand that Herr Daimler is suffering from weakness of the heart, which it is to be hoped is only of a temporary nature.

## A Steam Motor Mail Van for Ceylon.

**I**N a recent issue we stated that a large steam motor mail van had lately been supplied by Messrs. Julius Harvey and Co. for regular postal work in Colombo, Ceylon. We are now able to give an illustration of the vehicle, which was constructed by the Lancashire Steam Motor Co., of Leyland, on their well-known system. The van is constructed to carry one ton of mail matter in bags, and will make an average speed of about ten miles per hour on ordinary country roads. It has been put through a very long and severe test by the engineers for the Postal Department, which it has passed to their entire satisfaction.

WE learn that Mr. Frank Morriss, of King's Lynn, who has a large connection in Norfolk (having, besides his depots in Lynn, branch depots at Great Yarmouth and Norwich), has purchased a large site in Prince of Wales' Road, at the latter place upon which he intends to build a further motor depot for repairs, supplying parts and fittings, etc. We may also mention that Mr. Morriss has just added coachbuilding to his business, and has several motor-buses in course of construction, which, when completed, he intends running at Norwich, where he has already a service of Daimler cars in operation.

THE Wincycle Trading Company, Limited, has been registered with a capital of £5,000 to acquire all rights and title to the name Wincycle, and the goodwill of the cycle business carried on by the White Sewing Machine Company under that name, and to manufacture and deal in cycles, motor-cars, etc. The first directors are Messrs. R. S. Daville, A. Whale, J. Williams, S. F. Edge, and C. Sangster. The registered office is at 106 Great Saffron Hill, E.C.

## A HILL-CLIMBING CONTEST NEAR PARIS.

(From Our Own Correspondent.)
